There is another point to be considered upon which much of the effect of chords depends, that is, their pitch. Strike *G*, *B*, *D*, beginning on first line, bass staff, and observe how dull it sounds, then strike it an octave higher and note the difference. Then beginning on the line *G* again, arrange the chord thus, *G*, *D*, *B* (open harmony), and observe the beauty of it. Play the same arrangement two octaves higher and observe how thin it sounds. This gives a very useful hint as to how chords should be arranged at different pitches. When the pitch is low, the open position is best, when high, the close position. This is why the "wood instruments" in the orchestra generally play the chords in close harmony, the trombones in open harmony. To digress a little, some theorists maintain that consonance and dissonance are largely matters of pitch, as well as of proportion of vibrations. A fifth sounded of high pitch is decidedly unpleasant, but very pleasant if of low pitch. A third of high pitch is agreeable, of low pitch quite the reverse. The theory is, that it is owing to the audibility or inaudibility of certain overtones or resultant tones that the agreeableness of these intervals is changed with their pitch.

The common chords may be made to yield still more meanings when inverted, by the doublings that are made of the members, or the position, that is, which member of the chord is at the top.

It would far exceed the limits of this paper to attempt an exhaustive analysis of the effects that may be obtained from the dissonant groups by arranging them in various ways. Their most striking character is their "soliciting" quality, that is, the demand of the dissonant members to move in certain directions. This "soliciting" quality varies with different dissonances. In the dominant seventh chord it is so mild that it hardly deserves the name of dissonance. It is stronger in the seventh chord on the leading tone. Still more so in the seventh on the second degree of the scale and intense in the chord of diminished seventh, with its snarling expression of suppressed passion, so valuable to the dramatic writer, when treating of ghosts or demons, or merely human villians, of a totally different character are the chords of augmented sixth and augmented fifth. A peculiarity of the augmented sixth chord is, that in one of its forms it consists of the same sounds (in our tempered scale), as the dominant seventh, thus: *C*, *E*, *G*, *B♭*—*C*, *E*, *G*, *A♯* Strike the first of these groups and follow it by the chord *F*, *A*, *C*. Its effect is to augment the repose of the tonic chord, but follow it by the second inversion of *E*, *G♯*, *B*, and it seems as if endowed with eager exultant life with no thought of repose. The expression of the augmented fifth, especially when used with

the dominant seventh, as 1*G*, 7*F*, 3*B*, 5*D*♯ is one of intense longing, yet bright and keen. There is a beautiful illustration of this in the "Hymn of Praise." This chord is repeated thrice to usher in the return of the first theme.

As with the common chords, so with the dissonant chords, every change of position or inversion changes the expression of the chord. Still greater changes in the expression are the result—as has already been said—of the context. There are still two elements that modify, in an almost unlimited degree, the expression of chords. These are, rate of movement, and, even more than this, the loudness or softness of the passage in which the chord is used. But enough has been written to guide the student in experimenting with harmonic combinations and successions. But the warning must be repeated that these remarks are not to be taken in any "hard and fast" sense, the composer of genius can get any expression he wants from his materials. The most pathetic, solemn, dead march in existence is in C major, Handel's "Dead March in Saul." The most recklessly jovial drinking song in existence is in B minor, Casper's song in der Freischütz.

But if the beginner may be helped by these remarks on the meaning of chords, it is a sufficient excuse for having written them. To the gifted composer they are useless—musical instinct guides him in the use of his material, enabling him to do what, after all, is all that is necessary to write good music, viz., put the right note in the right place.

THE DEVELOPMENT OF THE PIANO.

FRANCIS L. YORK.

We have now traced the development of a many keyed, many stringed instrument down to the piano itself. Before taking up the perfecting of the somewhat clumsy first pianos and their growth into the modern concert grand, it is necessary to understand something of the matter of *temperament*. By this is meant such a tuning of the tones of the scale that twelve tones can be made to represent a much larger number without bad effect. To understand this we must go still further back and explain, to some extent at least, the formation of the scale itself. The twelve keys—black and white—which constitute an octave on the piano, represent twelve tones that are, as we say, each one half step from the adjoining one, either to the left or to the right, whether black or white. Tones having different names and actually of different pitch are, in some cases, represented by the same key, as, for instance, G♯ and A♭. G♯ and A♭ are not really the same tone, G♯ being a little higher than A♭, and though the difference is slight, it is enough to be easily recognized when the actual pitches are heard, and we can compare them with the pitches given by the piano or any other keyed instrument. If we take C as a starting point and go through the circle of keys, adding a sharp each time, at the sixth time we come to F♯, thus: C-G-D-A-E-B F♯. If we go in the other direction, adding a flat each time, with the same number of moves, we reach G♭, thus: C-F-B♭-E♭-A♭-D♭-G♭. Now, if we make each of these tones exactly a perfect fifth from the preceding, so that the ratio of the vibrations is the correct one—2 to 3—when we reach G♭ on the one hand and F♯ on the other, we find that the two tones do not quite coincide, as said before, G♭ is a little lower than F♯. This is not simply theoretical, though of course it is easily demonstrable by figuring out the number of vibrations, but can be proven to any one having a correct ear by actually tuning the strings of the piano in fifths. Another and perhaps simpler way is to tune an octave of twelve tones on the piano alternately up a fifth and down a fourth, thus: C up to G, down to D, up to A, down to E, up to B, and so on. In this, at the twelfth move, we have B♯ which is very perceptibly not the octave of C, but a tone a little higher. This discrepancy and even the modern remedy for it—equal temperament—was known more than two thousand years ago, but the remedy has only been generally accepted within the past fifty years. In the earlier attempts at music, say in the sixteenth century, but few scales were used and little trouble was experienced, as the few keys in use could be tuned fairly accurately and no bad effect be introduced. This system was called the mean tone system. By it part of the keys were made good, but the remainder were unbearable. When one attempted to use these remote keys, the imperfectly tuned intervals sounded so badly that the effect was compared to the howling of a wolf. In spite of this the organs in England, even as late as 1850–60, were tuned in this way. But after the sixteenth century, as the science of harmony began to develop and composers began to wish to use freer modulations, it was felt that some system of tuning by which it would be possible to use more varied harmonies was necessary. This was at first brought about by adding more keys. Even in the middle of the sixteenth century many organs had two extra keys to the octave, one between A and G♯, and the other between D and E♭. These were the "quarter notes" frequently mentioned in speaking of old organs. In an old English manuscript book of about the year 1685, we read that "the organ at the Temple hath quarter notes which no organ in England hath, and can play any tune . . . which no other organ will do." But this arrangement was very incomplete, as it only added a few perfect intervals to the scale and still left the intervals in the remoter keys very much out of tune. In Germany the old, unequal temperament gave way sooner than in England though even here the organ was much slower to adopt the modern tuning than the clavichord, the harpsichord and the piano. J. S. Bach was one of the first to appreciate the desirability of having some arrangement whereby the remote keys could be used and a closer relationship established between all keys. This could be brought about in one of two ways—either by adding a sufficient number of keys to represent the necessary tones, or by distributing the slight difference between F♯ and G over the whole scale *equally*. The first way, if practicable, would be the ideal way, if we consider each scale by itself without reference to its relation to others, for then all the scales would be in perfect tune. But the practical difficulties in the way were too great—the number of keys required to represent even a small proportion of the tones that are theoretically possible would make the keyboard so complicated that it would be impossible to play even the simplest compositions on it. A solution of the difficulty was found in a very ingenious though simple contrivance. By tuning each of the fifths in our series a very little flat all the scales were made equally good—*equally tempered*. Besides, by this arrangement a real chromatic scale was produced, the cycle of keys was perfected and true enharmonic changes were made possible.

In Bach's time, and as we have seen even much later, other systems of tuning were in use. Bach himself, it would seem, used both systems, equal temperament on the clavichord and the old mean tone or unequally tempered tuning on the organ. It is a noteworthy fact that Bach's organ compositions are written in keys that require only a few sharps or flats, while his piano pieces, notably the 48 Preludes and Fugues, are written in all keys. The latter series of pieces was, in fact, written with the especial purpose of showing the value of equal temperament. As stated above, the instruments of the piano class were much in advance of the organ in adopting the new tuning, and it was, no doubt, largely owing to this fact that the piano obtained its position as the most popular and really the most useful of all musical instruments. When tuned to the equal temperament it offered such exceptional resources to the composer that he at once took advantage of them with the result that the literature of the piano is by far the richest of all musical instruments. There has been and still is a great deal of discussion as to whether it is desirable or not to have an instrument on which perfect intonation is possible. Violin players are sometimes inclined to belittle the value of the piano in comparison to the violin, because the tones are not strictly accurate. I remember once that the celebrated violinist, Remenyi, said to me: "I don't think much of an instrument that you have to put out of tune before you can play on it," referring, of course, to the piano. But the general opinion among musicians at present is that equal temperament is a distinct advantage and, in most cases, would be advisable even if perfect intonation were possible. One illustration will show why this is so. Take what is called the enharmonic change of a tone, *i. e.*, for example, changing F♯ to G♭. If on the piano we could play these two tones accurately we should be obliged, in such a case, to play two different tones, whereas the beauty of the progression lies in the ambiguity of the tone, in the very fact that it can be interpreted in more than one way. Thus we see that by equally tempering the tuning of the piano a strong impulse was given to the development of music and the highest attainments of the modern chromatic genus of composition was made possible.

QUESTIONS.

1. What is tempering?
2. Why are B♯ and C not the same?
3. What was the mean tone system?
4. Why not have a separate key for every tone?
5. What great work was written to illustrate the possibilities of equal temperament?
6. What advantages do we gain by equal temperament?

A GUIDE TO THE STUDY OF MUSICAL LITERATURE.

ARTHUR L. MANCHESTER.

The writings of Schumann, as presented in the two volumes of "Music and Musicians," emphasize their value to the student as they are read and re-read. The faculty of combining discriminating literary ability with exact musical knowledge is so rare that their union, to a remarkable degree, in one so high in the musical firmament as Schumann excites attention. There is so much rhapsodical writing about music, so many distorted views of its province and misinterpretations of its meaning, that in reading analytical dissertations on compositions and estimates of composers, the cautious one is apt to take the author's assertions *cum grano salis*. With Schumann, this is not necessary. His assertions have not only the weight of his recognized accuracy of judgment, but they have stood the test of years.

The second volume of the above-named works is filled with short essays, filled with most practical and clarifying descriptions and analyses of compositions. They are educational to a degree. It being true that the average student of music must assist in the formation of his own powers of discriminative judgment by a careful and systematic reading of Music History, Biography and Æsthetic Literature, carried on in connection with a study of tone works themselves, the criticisms which Schumann has recorded in these two volumes are of untold worth.

There are sentences containing thoughts of great value to one who is developing his resources. "Simplicity alone does not make a work of art, but sometimes is as blameable as its opposite excess," is the statement of a truth we are sometimes likely to overlook. We are reminded of H. T. Finck's "Song and Song Writers," by the following paragraph: "'Of what avail is it to encourage passable beginners in song composition, or to endeavor to stop the throats of mediocre screamers? I would rather sit down before a pile of songs, and never rest until I have found a few really good ones that will enable me to praise, at least, to my heart's content.' I searched for a long time among about fifty collections. At last I found three together that warmed, delighted and filled me with the breath of praise."

Like the moving before our physical sight of a panorama, does the following pass before our mental vision the progress of music. "Musical, like political, revolutions penetrate under the lowest roof into the smallest matter. In music we observe the new influence in precisely that branch where art is sensuously allied to common life—in the dance.

"As contrapuntal predominance disappeared, miniature sarabands, hoops and patches went out of fashion, and pigtails became much shorter. Then the minuets of Mozart and Haydn rustled by in their long trains, while people stood facing each other decorously and silently, bowing often, and finally walking away; a grave peruke was still to be seen here and there, but the hitherto stiffly-laced figures already began to move more gracefully and elastically. Then young Beethoven broke in, breathless, yet embarrassed and disturbed, with long, disordered hair, neck and brow free as Hamlet's, and people were greatly astonished at the eccentric fellow; but the ball-room was too narrow and tiresome for him, and he rushed out into the darkness, through thick and thin, elbowing fashion and ceremony, but moving aside lest he should step on the flowers; and those who are pleased with such a nature called it Caprice, or anything you like. And then a new generation grew up; the children became youths and maidens, so shy, so dreamy, that they scarcely ventured to look at each other. Here sits one of them, baptized John (Field), at the pianoforte, on which the moonbeams broadly shine and kiss the tones. Another sleeps upon stones, and dreams of his re-arisen fatherland (Chopin). No one thinks any more of sociability, of sympathy, for each one thinks and acts for himself; yet wit, irony and egotism are not wanting. A clear merry string resounds from Strauss; but the deeper ones, seized by the spirit of the day, are overpowered but for a moment. "How will all end, and whither are we tending?"

Such thoughts and opinions as this master put before the reader should be made thoroughly one's own. The literature of aesthetics and criticism has no better material to offer than this. It is educative, both in furnishing information and affording a training for the powers of the reader.

Turning our attention to the inquiry concerning the basal elements of the beautiful in music, we touch a subject which can readily become too involved and speculative for practical use. Yet it is necessary for us to have some clear, well-defined ideas as to what constitutes the beautiful in music. The books of Henderson and Krehbiel, previously named, have given us a basis for our understanding of music, and now the reading of a little book by Ernst Paur, "The Elements of the Beautiful in Music," will do much to clarify our minds on this subject. It is simply written and, after some introductory remarks, which map out the course of procedure, chapters on "Formal Beauty," "Characteristic Beauty" and "Ideal Beauty" give a practical exposition of the aesthetic basis of musical beauty. The contents of these chapters should be tranferred to the mind of the student, if he would be able to perceive the value of the music he uses.

Closely allied to this is a work by M. Mathis Lussy, "Musical Expression." Upon the knowledge gathered from the preceding can be based the directions herein given for the proper use of nuance, accent and tempo. The book is an attempt to demonstrate the reasons which govern these methods of expression.

FOR THE YOUNG PEOPLE.

The Young Musicians' Perseverance Club.

Conducted by ARTHUR L. MANCHESTER.

Our letters have been so interesting lately that space has been given them in preference to sermons by the editor. No doubt our members are glad that this is the case.

But the editor must take space to tell of a kind deed done by some of our members to another. It is this: They sent a subscription to THE MUSICIAN as an Easter gift to a clubmate. How pleasant it is to have our club give rise to such comradeship. The editor was remembered, too, with a beautiful Easter card. Good fellowship, kind thoughts and the spirit of helping each other are what we want in our Perseverance Club. Let us, each one, contribute to it.

Geraldine Buzby sent answers to March questions, but they came too late for the April number.

April answers are:

1. Parchment.
2. Papyrus is the more ancient.
3. 850 years afterward. Printing was invented in 1440.
4. A. D. 584.
5. Italy.
6. He was Bishop of Milan.
7. Diatonic means "through the tones," and pertains to the scale of eight tones, the eighth of which is the octave of the first.
8. The Egyptians.
9. Pythagoras was an ancient Greek philospher.
10. Notation is the system of signs by means of which music is represented.

And here is a long list of those who have sent answers. It is splendid that our members are taking hold of this work so well.

Cora Overbaugh.

Now let us gather about the Club table for our experience meeting.

And first we have a frank confession, followed by a cheering statement. Perhaps Elfreda Littlejohn will let us hear from her in answer to the question.

McSHERRYTOWN, PA.

Dear Mr. Manchester—I don't know just what you would like me to tell you about. I used to be just awful about my music, but now I am behaving better, my teacher says. I am learning a piece by Mr. Engelmann, and my exercise is in seven sharps. Did Elfreda Littlejohn get killed in the Galveston storm? I belong to the Club, and we—juniors—have our meeting the first Saturday of each month. Ida is going to see you, and we all wish we could be with her.

AVA MILLER.

The new members continue to come and we are glad to make a place at the table for them.

MONTEREY, KY.

Dear Sir—I have been reading your MUSICIAN for several months. I am fifteen years old and have been taking music lessons about three years. My last pieces were "Quo Vadis," by F. V. Bowers, and "Longing for Home," by Albert Jungmann. I would like to join the Perseverance Club and answer the questions in THE MUSICIAN each month. Find enclosed a slip of paper containing the answers to the questions

Yours truly,
SUTIE J. NICHOLS.

Move together and make room for this member from Ohio. We are pleased that she has been taking part even before she joined us. She is to be congratulated on being so well advanced and should be stimulated to practice.

FINDLAY, OHIO.

Dear Mr. Manchester—I have been a subscriber to THE MUSICIAN for about three months and I like it very much. Although I have not joined "The Y. M. Perseverance Club" yet, I am very much interested in it and like to read the letters from new members. Will you please accept me as a member of the club? I am fourteen years old and, in June, I will have taken lessons four years. I am in the fourth grade of the National Graded Course of studies, and among the pieces that I play are Godard's "Au Matin," "The Song of the Bathers" and H. Ravina's "Etude de Style." I love music but, I must confess, I do not always like to practice. I will have to close my letter. So, wishing the Club success, I remain,

Its friend and well wisher,
STELLA BENNETT.

Another new face. We will be compelled to get a bigger table pretty soon. We will do so, if it becomes necessary. We must make room for all.

CLEVELAND, OHIO.

Dear Sir—Enclosed are my answers to the April Club work. I would like to join your Club, having taken THE MUSICIAN since last October. I am very fond of music and have taken lessons this last Summer and Winter. I am fourteen years of age. Among the music which I have taken are these: Clementi's Sonatinas, Kuhlau Sonatinas; "On the Meadows," by Lichner; "La Fontaine," by Bohm, and "Bubbling Spring," by Rive King. I think, with Miss Mary Cleary, that you intend giving us church or sacred music to study. Wishing the Club every success, I remain,

Yours truly,
ETHEL A. HARRIS.

Yes, we are all delighted that old and new members are at work. This member has been very faithful from the beginning.

WIDE AWAKE CLUB, IRONTON, OHIO.

Dear Mr. Manchester—I am pleased to notice the large numbers we have and hope they will keep at the work, as it is so interesting. Several of the old members have come in again and we are glad to see them back. We all sympathize with Ruth Simpson, as some of us have been lonely, and people do not care enough about music to start anything like a club. She can feel at home in "The Young Musicians' Perseverance Club," as reading the letters will make her seem to be with us. I like the stories about "Church Music." Will you please put the pictures in THE MUSICIAN? We would all be delighted to see one another, I am sure. Wishing the Club success, I remain,

Your devoted Club member,
JEANNIE C. DAVIS.

Here is another member from Monterey, Ky. These two can get together and answer the questions.

MONTEREY, KY.

Dear Mr. Manchester—I have been reading the Young People's page in THE MUSICIAN and feel that I would like to become interested in your "Perseverance Club." I am eleven years of age and love music very much. I have taken lessons since I was seven years old. I have just finished taking "Polonaise Brillante," by Gustav Merkel. I will send, on a separate sheet, my answers to the questions in the April number of THE MUSICIAN. Hoping my name will appear in your next issue, I am,

Your little friend,
FLORENCE L. GAYLE.

TWO MUSICAL MISSIONARIES.

It was the hour of vespers in the monastery of St. Gregory. The subdued light was filling the chapel, glinting in purple and rose color over the white flowers on the cross, and the surplices of the neophytes bearing the lighted candles, and on the stillness the choristers' chant was rising in its clear unison. Two voices sounded above the others, seeming to lead and sustain them. The monks could not see the choristers because of the great tapestry hangings, but for many months they had heard the clear tones of the two singers, at matins and at vespers, and now they knew that this was to be the last service at which they would hear them, for on the morrow an important mission was to be intrusted the young monks, and they were to be sent forth by the Pope. A year had passed since St. Isidore, during his visit to the monastery, had copied the Antiphonarium and taken his copy back with him to Spain, but his visit gave a new thought to the Pope, and he had decided to set scribes at once to work copying the manuscript of the Antiphonarium, that the copies might be sent to every large monastery and church in the then known world. And not only were the copies to be made, but singers were to be specially trained as teachers, and these would bear the copies forth to the world.

Now the young monks—Romanus and Petrus—who had developed these wonderful voices would, indeed, be sadly missed from the monastery, for they were lovely of heart and mind, as well as beautiful singers, but from the great song-school, at Metz, word had been sent that two leading voices were needed to lend aid to the Roman teachers already there, and as the distance seemed far in those days, and also because it was at the first of the Winter season, the monks felt that they were to say a long farewell to the young singers, not knowing it was to be a final one. Still, this too might have been in their thoughts as they bade Godspeed to these comrades on the morrow, for it was still firmly believed that the end of the world was at hand. Many were gathered in the courtyard, at the East Gate, and knelt there at early dawn, their bare heads and wan, white faces uplifted, their hands clasped and their long, black gowns sweeping about them, while rapidly muttered prayers were said for the two going slowly, with bent heads and no backward look, out through the arch of the gateway in the high stone walls, and so into the road leading away toward an unknown world; for they had begun the convent life early, as neophytes, serving at the altar in their white gowns, until taking up their music study in St. Gregory's reign, and so had little knowledge of what lay outside the monastery walls. Each clasped his copy of the Antiphonarium, and going down the long hill their eyes were turned toward the East where the sun was rising above banks of glorious clouds of crimson and gold. When the edge of the round ball had fully left the cloud beneath it the monks knelt, facing the radiance, and repeating the *Pater Noster*. Afterward they sang together, going on down the hill, the "Morning Hymn" of St. Ambrose, the chant being among the first in the books they carried, and rearranged by St. Gregory from the old Ambrosian tones. And now they were looking away from the East, and down over Rome, where the palaces lay in ruins in the early sunlight, the basilica of St. Peter's seeming the only great building left.

On the outskirts of the city the travelers took a path leading directly away from it. The Pope had told them about many of the roads and, when in doubt or in danger of losing their way, they could always inquire at the towns or villages through which they were sure to pass.

Toward the close of the day, as it was the beginning of Winter and they had traveled in haste, they drew near a foundry, not far from a large town, and here a ceremony was taking place, which had brought together the people, both rich and poor, from the town beyond. The mould of a great bell had been broken and the people were gathered for the baptism, which was given the large bells sent out from the foundries. The bell that had been taken from its mould was beautiful to look upon, for though of copper, it was bright as gold, and upon its surface were the words in Latin:

"Ave Maria is my name,
All storms I drive away."

The wealthy people of the town stood as its godfathers and godmothers, and it was being arrayed by the mastersmith in a crimson embroidered robe. And now the people drew nearer, for the priest appeared in his surplice and stole, a cross was held up before him and he said the prayer of consecration; that where the bell hung, after it should be moved to its belfry, the attacks of enemies might be brought to naught; that in the sound of its ringing a blessing might be shed abroad; that all within reach of that sound might be free from the evil of whirlwinds, the sweep of floods, the stroke of thunderbolts, the flames of lightning and the wreck of tempests. Then, throwing holy-water upon it, he prayed that where its melody sounded the hearts of those who heard it might increase in faith and holiness; and while he stretched forth his hands toward it in final blessing the people sang the *Da Pacem*.

Romanus and Petrus had joined in the closing hymn and gone on their way, talking together of the ceremony and then of many things which they had learned at the monastery about the bells of those days. Of how each bell was christened with a name which, together with its particular office or power, was written in the soft mould before the bell was cast, and so, when the mould was broken, could be read on the solid surface. Of how the bell "Guthlac," of the Convent of Croyland, was said to ring often of itself without the aid of mortal hand; of how the three silver bells of the Bologna Monastery were seen to leave their belfries, at certain seasons, and to float like clouds through the air, many describing their chiming as sounding at these times like celestial music; and of the tradition that always a bell, consecrated and christened in the manner of the *Ave Maria*, which they had just seen, possessed the power to keep all harm away from those within the sound of its chime.

And while they were speaking the *angelus* stole to their ears, across the snow-bound fields from the distant town, and the monks, making the sign of the cross, paused in their journey, standing with bent heads, until its echoes had died away on the evening breeze.

Write out the definition of the following words which occur in the story above:

1. Vespers.
2. Matins.
3. Neophytes.
4. *Pater Noster*.
5. Basilica.
6. Angelus.
7. Who was St. Gregory?
8. Who was St. Ambrose?
9. How did St. Gregory improve upon the musical system of St. Ambrose?
10. What was the Antiphonarium, and from what word is the name derived?

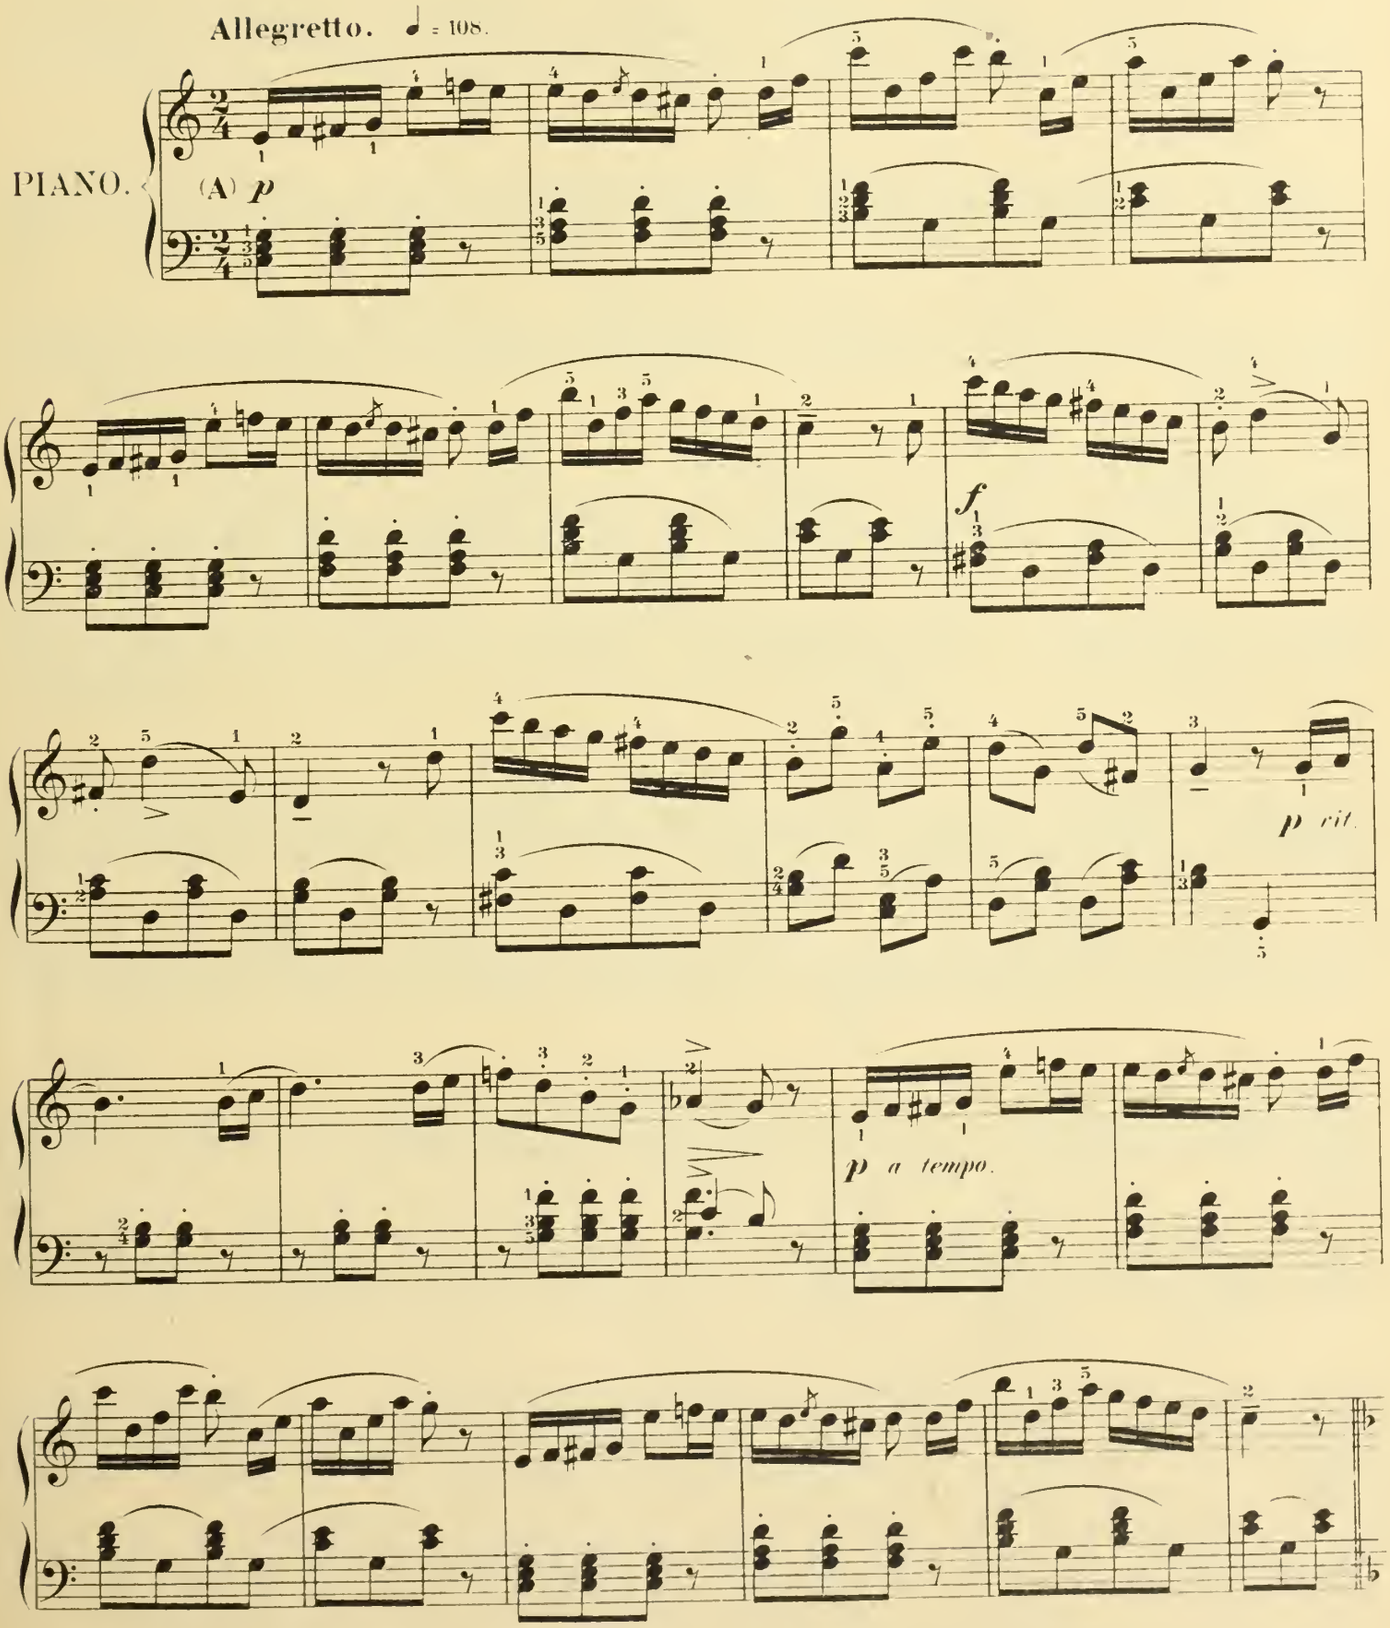
DANCE OF THE SYLPHS.

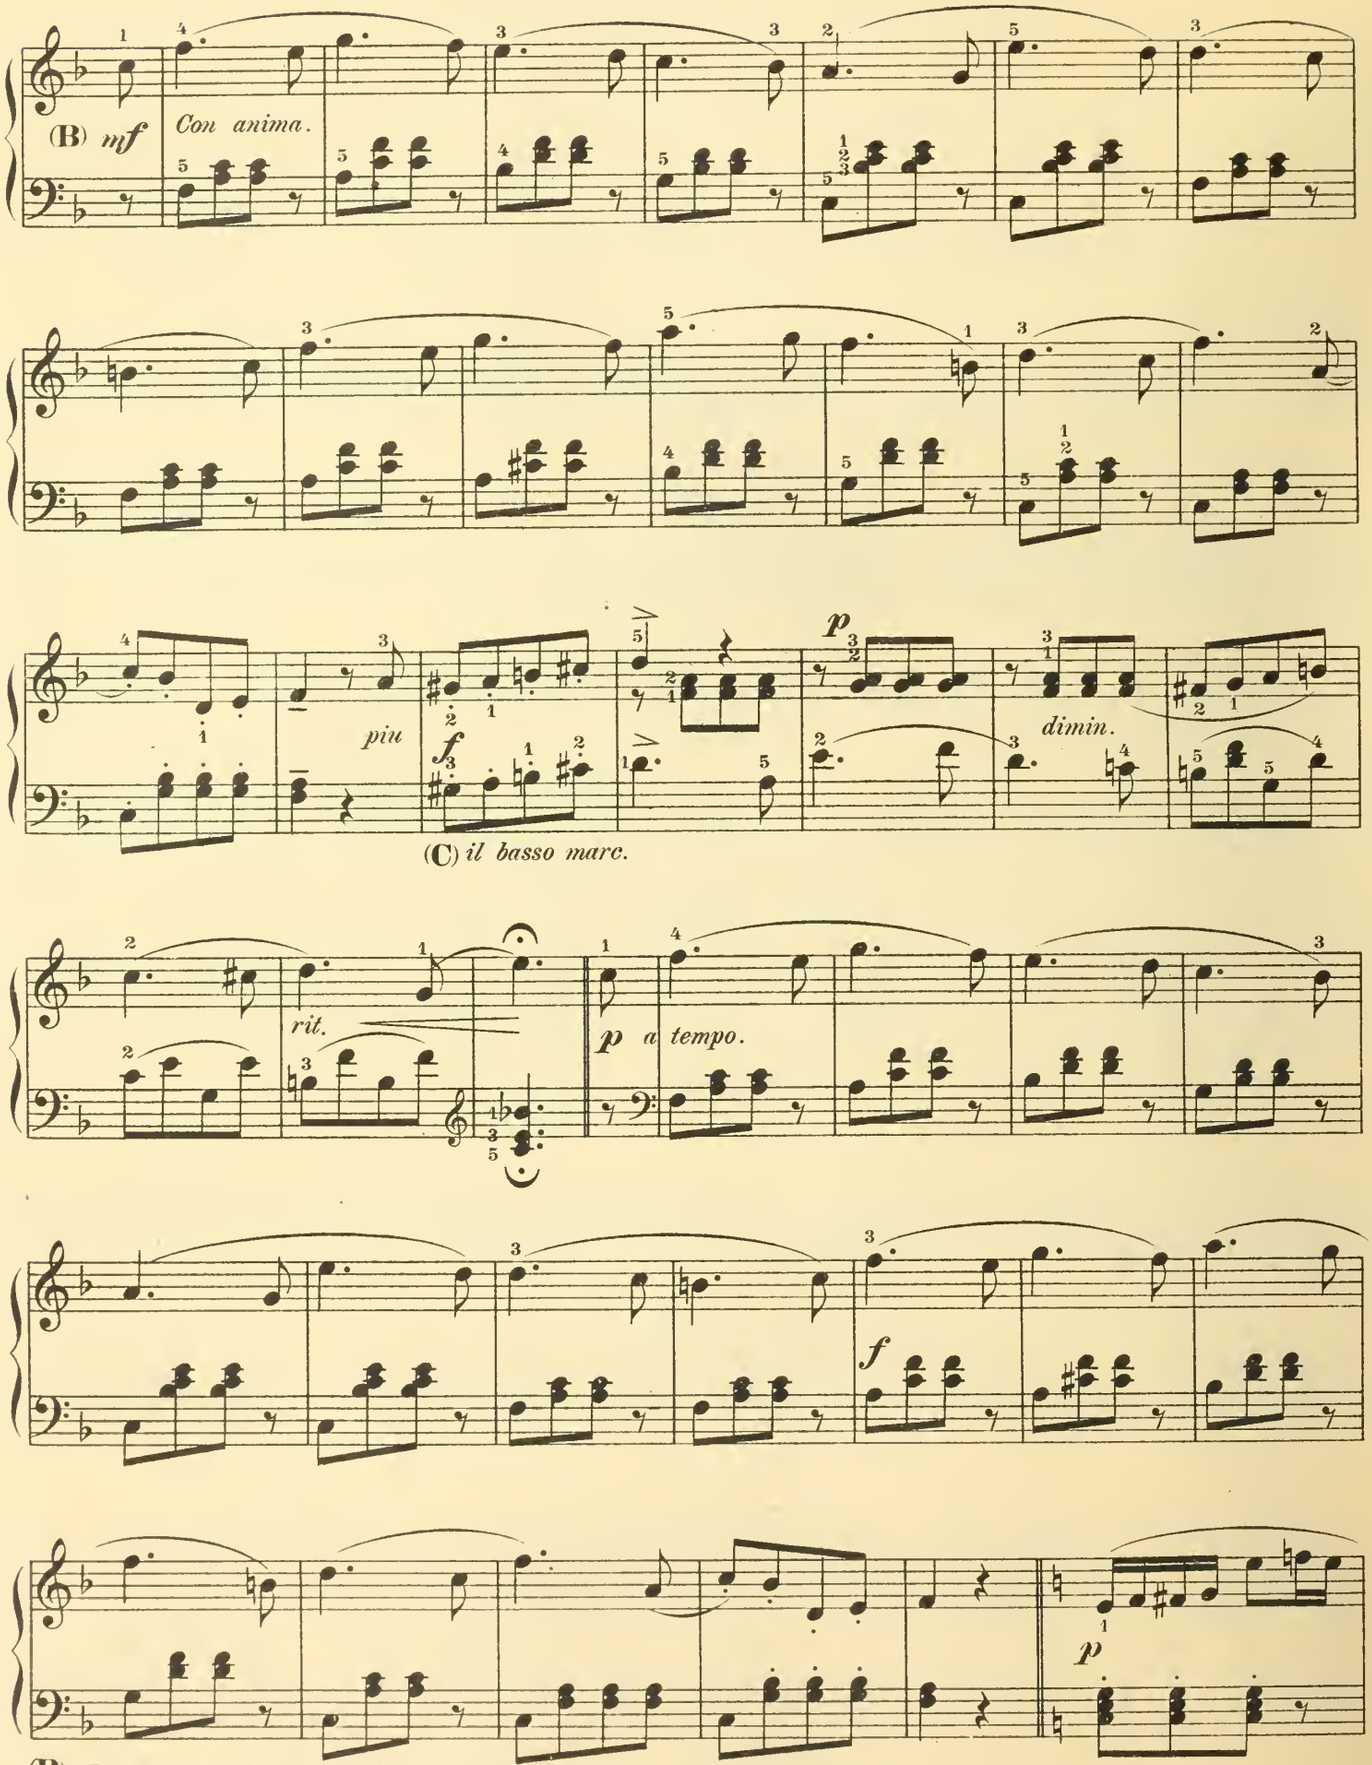
(SYLPHENTANZ.)

W. LEGE. Op. 59. № 1

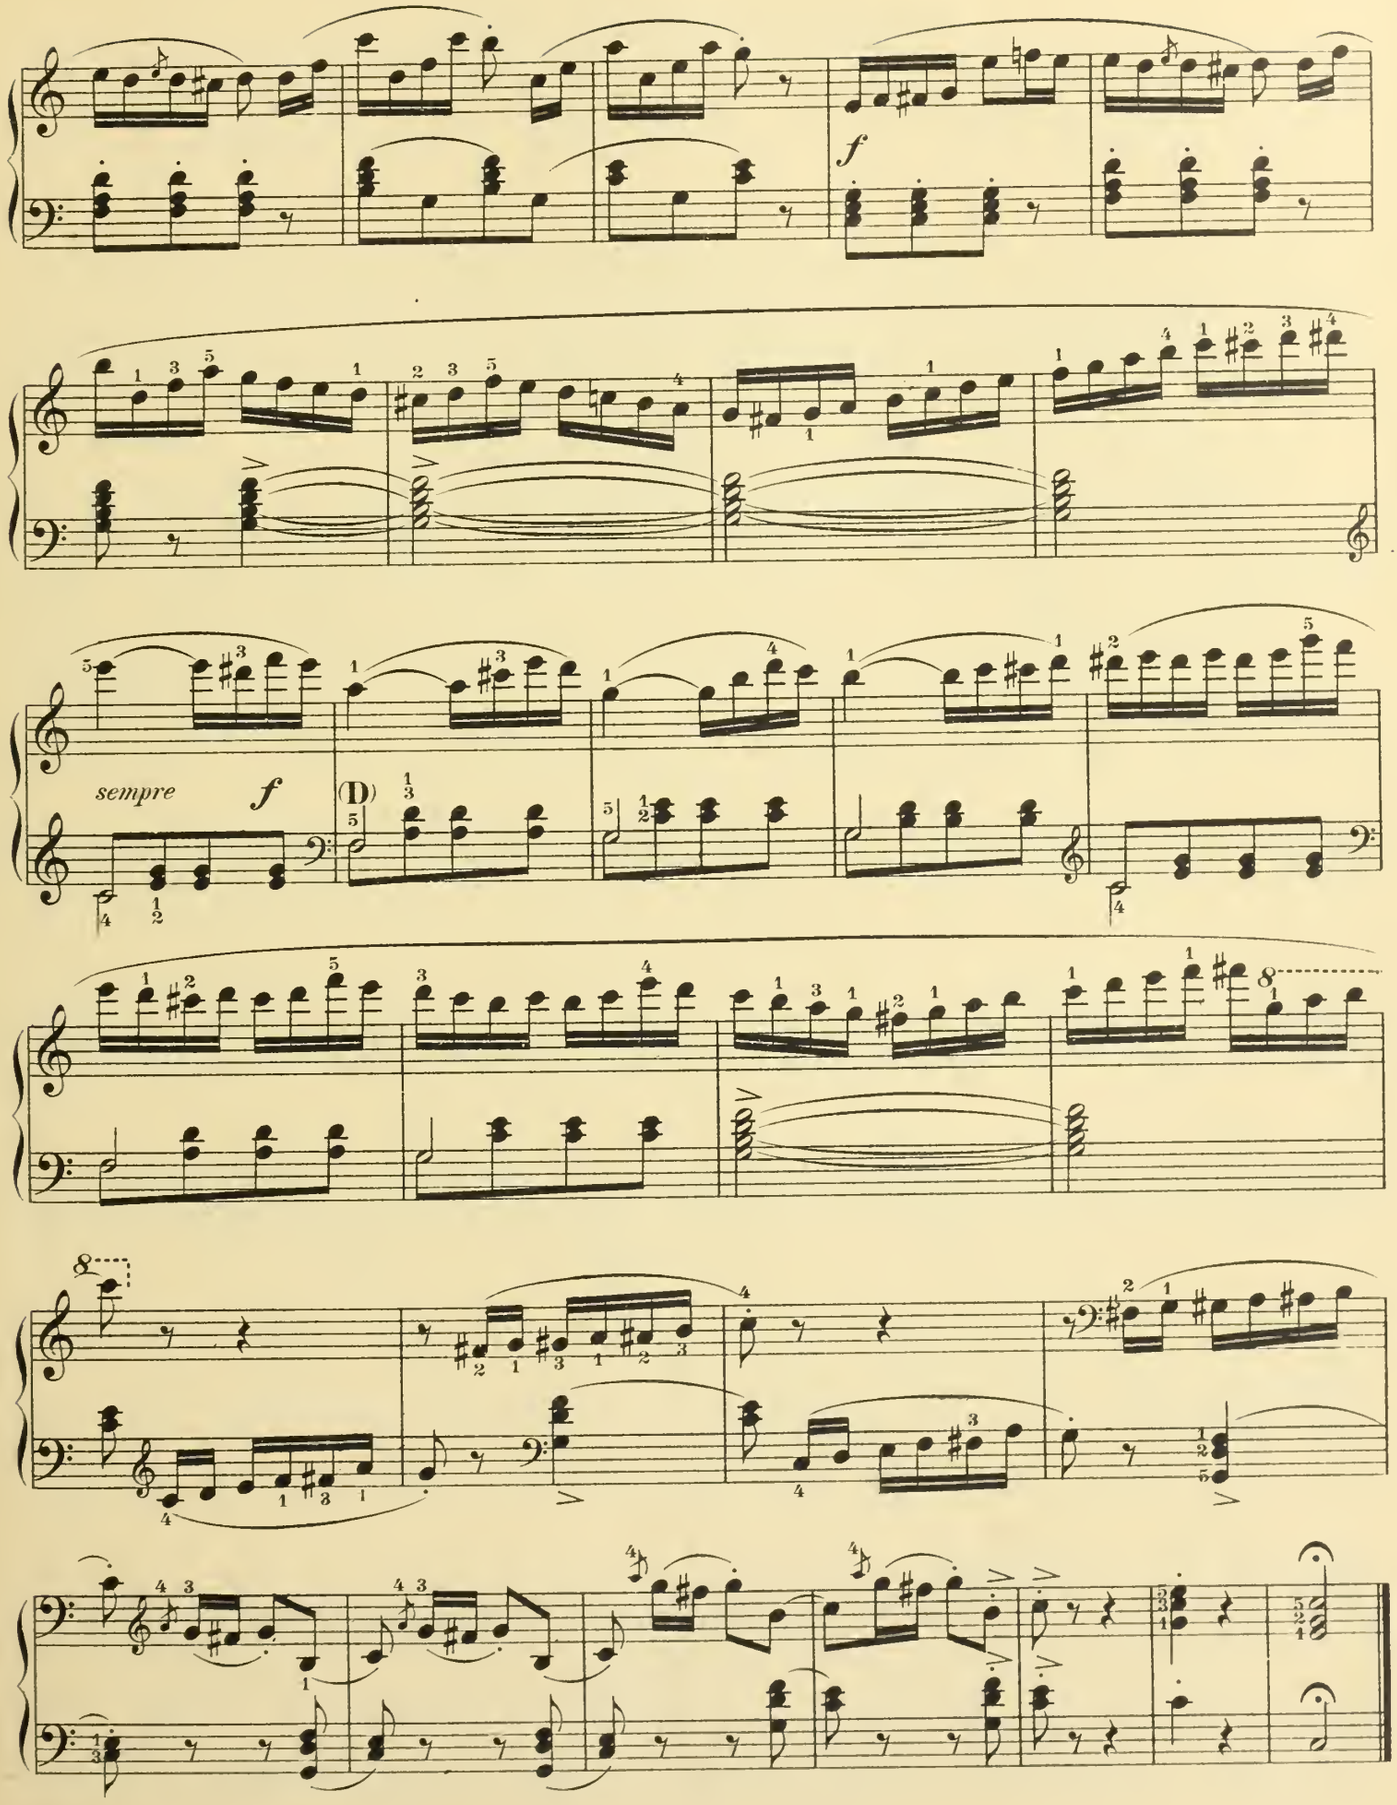


(A) Neat *wrist* stroke in Bass, while preserving strict *legato* in Treble. Give attention to phrasing

Copyright MDCCCC by Hatch Music Co.



(B) Firmer tone and with more brightness.
(C) Make the Bass prominent for four measures.



(D) From this point considerable brilliancy is needed: maintain it to the end.

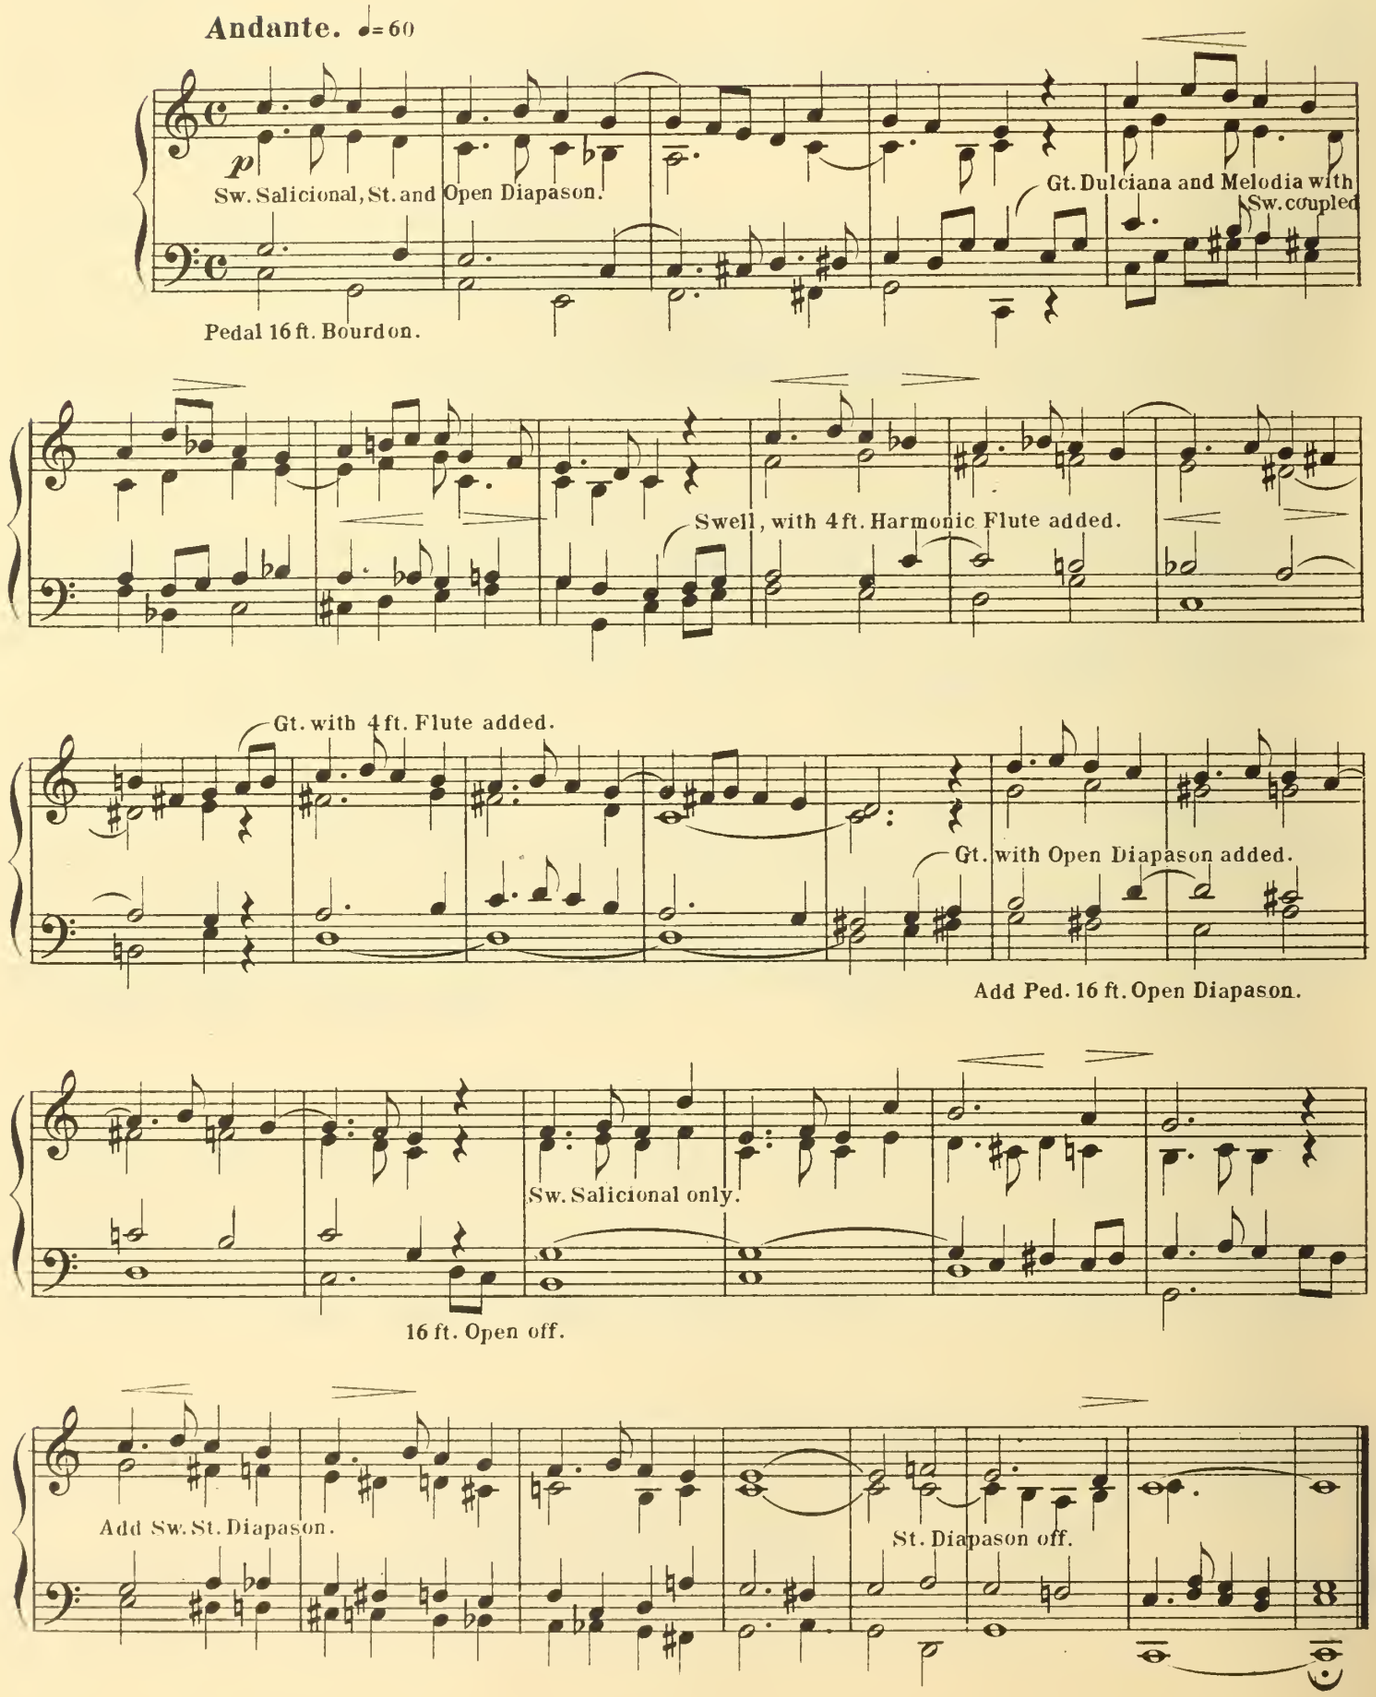
WM. HORATIO CLARKE.



WOMAN'S PAGE

Conducted by Miss S. C. VERY.

ANGLO-SAXON WOMEN IN MUSIC.

Two Women Composers.

AGNES ZIMMERMANN,
PIANIST-COMPOSER.
(See January issue.)

We publish, to-day, a letter sent across the sea to the Woman's Page of THE MUSICIAN from Stella Stocker. At the same time we give a selection of Mrs. Stocker's compositions. For awhile she was director of the Cecilian Society, of Duluth, Minnesota, which she herself organized. Recently she has devoted her time to lecturing and, while on the present trip abroad, is at one of the suburbs of Hamburg.

BERGDORF, GERMANY, MARCH, 1901.

Greeting to THE MUSICIAN *and to its readers!*

I am happy to find myself again in the Fatherland of Harmony, but the contrast between the music culture of America and Germany—so marked years ago—cannot now be made, and I acknowledge that to enjoy a feast of music and to obtain the highest education in the art it is not necessary to cross the sea. Our music magazines, women's clubs, choral societies, etc., have so raised America's standard that travellers in Europe can, with real pride, speak of the music in America.

In many respects this quaint little city of Bergdorf, whose charms are entirely unknown to the Americans, might convince one that she had drifted backward half a century or more. Primitive and picturesque as it is, still Hamburg, the great, busy seaport, is within half an hour's ride. There plenty of music is to be had and there are excellent musicians.

I spent the other afternoon with Caroline Wichern, an artist celebrated through Germany and England as composer and teacher of singing. As a child she improvised so cleverly that she was urged to express her thoughts on paper; later, her father was called to Berlin as Geheimrath, where Caroline had an opportunity of studying theory and composition thoroughly with the celebrated Weitzman. For ten years she was in London and in Manchester, where she was director of music at Victoria College and at the Kindergarten Training College. At present she is director of music at a large institution called Rauhes Haus, one of the celebrated points of interest in Hamburg. Here she lives and works, dividing her time between composition and lessons.

Awhile ago she brought out in Hamburg a beautiful composition for chorus and orchestra—the chorus is said to have been fine, the orchestra the best in Hamburg, and the director was Caroline Wichern herself. The result was a brilliant success, and the studio of the artist is adorned with a large laurel wreath and gold-lettered banners of scarlet silk, sent in tribute to the composer-director. Fraülein Wichern's studios would charm any music-lover; they are crowded with art souvenirs, pictures, busts and music of all kinds. The grand piano is covered with musical compositions. Many of her own are in manuscript, many have been published by the best houses in Europe—Novello and Ewer in London, Palma and Aug. Cranz in Leipzig. She sang for me some songs which pleased me very much. They were for children, the chorus with orchestral accompaniment. As there is yet no piano score, she played the compositions for me from the orchestra edition.

Caroline Wichern is an unselfish woman, working constantly for others; she is also a liberal and noble musician and eager to learn of progress of art in other lands. My visit was one of real pleasure and its repetition was assured by her parting words: "Auf wiedersehen; we are friends."

Cordially yours,
STELLA PRINCE STOCKER.

Such joy it is to hear her sing
We fall in love with everything—
The simple things of every day
Grow lovelier than words can say.
—*J. W. Riley.*

CLUB WORK.

WAGNER-BRAHMS CLUB OF WASHINGTON, D. C.

Out of the desire of three young women of Washington to hear, with some understanding, the music-dramas of Richard Wagner, has sprung a small woman's club that proudly calls itself the Wagner-Brahms Club, thus hyphenating the names of those two great composers whose animosity towards each other's musical methods makes the venture rather daring.

The club is formed upon such simple lines that perhaps a brief account of its plan may be helpful to other women who fear becoming involved in difficulties attendant upon club work.

Washington affords unusual opportunities for students in the musical department of the Congressional Library, where copies of all music with an American copyright can be found. A separate room, provided with a grand piano, enables one to make use of the library and there these three girls spent many afternoons over "Lohengrin" and "Die Walkure," the two Wagner works to be sung that year during the meagre four performances that are our Capitol's annual allottment. So great was their enjoyment of the operas with but this slight preparation that they resolved to form a club for a general study of the Wagner Dramas. The next year they rallied a few members together, and with the small sum of one dollar each—the annual dues—began not only the study but the formation of a library for the club as well. The faithful ones profitted thereby considerably, but the work was rather one-sided—the pianist reading the score and another member enlightening all from that estimable guide, "The Music Dramas of Richard Wagner," by Albert Lavignac. And so, those who were hearers only became desultory, the regular attendance diminished and the club felt very insecure, until a presiding genius came (in presence of Miss Ulkè) bringing European ideas and energy into the circle, so that the past Winter's work has been crowned with success. The first half of the year was devoted to the Nibelungen Triology; the latter half to the works of Johannes Brahms. It was found that a plan of study in which each member could take some active part was necessary to the life interest of the club, so at the weekly meetings now held an essay relating to the Wagner work under consideration is read, then an hour of score work and, after that, some solos from his compositions. In that way a more general idea of his development in art is given, as all of his minor compositions, aside from his operas, are looked into.

When the study of Brahms's work was undertaken, the same arrangement as to essays was carried out, vocal and instrumental works heard and, when possible, some annotations read. Programs are arranged several weeks in advance to give ample time for preparation; meetings are held at the homes of the members. *Finished* performances are not expected: the object is study, not personal glory. Brahms's work is so comparatively little known in this country that the club attracted interest in its work from outsiders and received requests from artists to attend meetings and play for members—proving how much good listeners are appreciated. The only expenses of the club are for music and postage. Social element of refreshments is debarred and all is regulated on an economical plan. The president secretary-treasurer sends out postals every six weeks, giving dates and places of meeting; she also attends to the essay department without finding herself overburdened. The musical director sees that there is sufficient diversity in the program and has enabled the club to hear solos for piano, violin, 'cello, also vocal solos and duets. The following essays have been read during the year: "Life of Wagner"; "Dramatic Influences on Wagner"; "Musical Influences from which Wagner Drew"; "Wagner as a Poet, Writer, Musician"; "His Influence on Modern Music"; "Wagner as a Conductor, and Great Wagnerian Conductors"; "Great Wagnerian Singers"; "German Mythology"; "Scandinavian Eddas"; "Modern Music" (leading to Brahms); "Brahms as a Writer of Songs"; "Brahms's Greater Works," illustrated by Violin and Piano Sonata, Op. 78, Liebes Waltzer, Songs, etc.

Congratulations are due to Miss Jessie McBride, the ruling spirit of this successful club who, in an interview, said that now the club is prepared to study Germany's modern borderland composers (Tschaikowsky, Grieg, Dvorak, etc.), their future program of study.

PROGRAM OF A CANADIAN CLUB.

The St. Catherine's Music Circle recently gave a piano recital, at which the Ladies' Choral Club assisted, rendering:

Mrs. H. H. A. Beach . . "The Rose of Aventown."
Froelich . . . . . "The Bird and the Rose."
Neidlinger . . . . . "Peggy."

The Misses Murphy and Fitzgerald played selections by Chopin, Schumann, Henselt, Raff, Saint-Saëns and Sinding.

The hand-book of the Asiatic Room of the Crosby Brown Collection of Musical Instruments is just out. Those who have made inquiries relating thereto can obtain it by applying to Curator of Museum, New York City, N. Y.

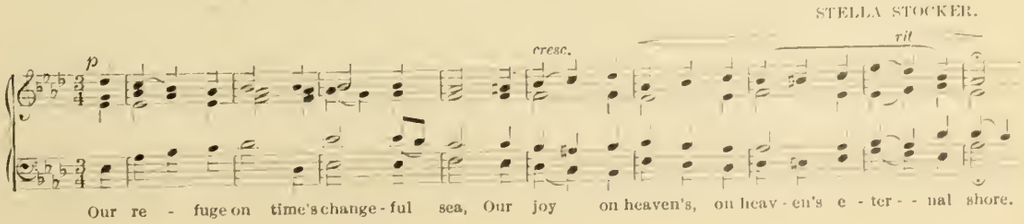
Offer of loan of Year Books made last year is repeated, but none will be sent after June, 1901.

"The circle of human nature is not complete without the arc of feeling and emotion. The lilies of the field have a value for us beyond their botanical ones; a certain lightening of the heart accompanies the declaration that 'Solomon, in all his glory, was not arrayed like one of these.' The sound of the village bell, which comes mellowed from the valley to the traveller upon the hill, has a value beyond its acoustical one. The setting sun, when it mantles with the bloom of roses the Alpine snows, has a value beyond its optical one. The starry heavens, as you know, had for Emmanuel Kant a value beyond their astronomical one. Round about the intellect sweeps the horizon of emotions from which all our noblest impulses are derived. I think it very desirable to keep this horizon open; not to permit either priest or philosopher to draw the shutters between you and it."
—*John Tyndall.*

In music it is as with chess-playing—The Queen, melody, possesses supreme power; but it is the King, harmony, who ultimately decides.—*Schumann.*

"Almighty Father"—Anthem for Mixed Voices.

STELLA STOCKER.



THE GYPSIES AND THEIR MUSIC.

MRS. JOHN FREEMAN.

(Concluded from March.)

The next morning the men insisted that they go as protectors still further—some on horsback, some running on foot—to the nearest village. "The closeness of the day before was followed by a rainstorm, but they refreshed themselves with parting drinks and glowed with delight, rejoicing in the fitful rushes of the rain. In their turned lamb-skins, they looked like bears on raging steeds, for they spurred their horses so furiously, that they leaped about like carps. The abandon of these people could scarcely be kept within bounds any longer. They reached a tavern not far off, and here this extraordinary carnival came to an end with a morning serenade under a huge shed, and pretending that it did not rain, the symphony began with an animated flourish (con-estro poetico), but the circulating morning's wine and the liquor of the day before, infused them with fresh vigor, and soon led to a rinforzando-con-rabbia. The thunder growled in the distance like continuous bass. The high beams and half fallen walls of the shed gave back such an echo that every sound struck upon the ear with redoubled power. Passionate passages and feats of virtuosity followed each other and were confusedly mixed. This musical morning roar was rent into tatters of tones, and in the stormy finale it seemed as if all the sounds were piled upon each other like a mountain ridge. One could hardly tell whether the old building hadn't tumbled in, so deafening was the instrumentation of this concert, which certainly would not have received a favorable verdict from any conservatory, and which I, myself, must declare, was somewhat daring." But what is all this in comparison with the effect when the artist takes his own pencil and depicts these scenes in music, the spirit of which re-echoes them all. The artist has given us his own account of this unpolluted nature and her children. Our musical picture-gallery has been remarkably enriched with his Hungarian Rhapsodies, in which he has successfully painted in tones all that life which he has sketched in words, and thus preserved it to the world of art. The "Hungarian Fantasy," for piano and orchestra, and the stately symphonic poem, "Hungaria," gives a memorial picture of this animated Hungarian life, so full of strange power and extreme contrasts with which, also, in this regard, the nature-world of the Gypsies was fully identified. It was important to give a definite description of it, for it seems in this connection, above all else, necessary to furnish details and essentials of a music, which in contrast with our European musical creations in their accepted forms, is a world in itself in harmony, rhythm, melody and instrumentation; and one which we recognize as wonderfully fanciful and rich in color, and yet full of the germs of life. Liszt was anxious to know what effect continual kindness of treatment would have over the innate wantonness of the Gypsy nature. Might not one, by carefully fostering their music, develop it to a fuller growth in the atmosphere of civilization and improve its beauty. Liszt had expressed himself when in Hungary, of finding a young Gypsy with a talent for the violin, which he might further develop. Count Taleky had remembered it, and upon finding such a boy, purchased and sent him to Liszt. He was slim, nervous and insolent. To steal out of greediness, to continually hug the women, to break every object whose mechanism he did not understand, were very inconvenient but natural faults. It was not easy to deal with them, as they continually broke out in new directions. Josy soon became a little lion and his private concerts kept his purse well filled; but he flung the money about recklessly. His first object was to adorn his person. To become an Adonis was the great problem of his existence, but one pang gnawed at his heart and poisoned his peace. His complexion was so brown and yellow. He always threw down five franc pieces and never took any change. On leaving for Spain, Liszt gave him over to the violin professor of the Paris Conservatory. His promises to work hard were of the best, but all accounts from him, however, more and more confirmed Liszt's doubts of the success of these educational schemes. Like a genuine savage, he was interested only in *his own* pleasures, *his own* violin and *his own* music. He was very partial to the melodies he had heard Liszt play many times, and he would often regale his own audience with them, ornamenting them, however, in such a droll fashion, that they never failed to set every one in a cheerful mood. Josy grew larger, but otherwise made no progress. Liszt sent word to him to meet him in Sträsburg. When he stepped from the carriage he suddenly felt a violent hand-shake and was almost suffocated in the embraces of a strange young man. It took some time before he could recognize in this elegant young gentleman, his little untamed harum-scarum Gypsy of the Moors. The self-conceit was the same. In reply to Liszt exclaiming, "Why, Josy, you look like a young gentleman." With the mien of an hidalgo, he replied, "Yes, because I am one." Liszt could no longer force an organization which was at utter variance with the temperament of our society and culture, so he allowed his son of the wilderness to come to Vienna that he might join his companions, if he so wished. His rapture at seeing them was boundless. They feared he would go mad, but the elasticity of such nerves knows no limits. Did he ever see him again, this most perverse of all his countless scholars, on the edge of the wood with his violin, smoking or dreaming? No. Liszt afterward received a letter from him, which shows that culture had some influence upon him. He said, "Since I have become the father of a family, and acquired a restful spirit and clear understanding, I reflect with sadness that in my youth I might have had the good fortune, under your Highness protection and patronage, of an introduction to the great world, and of artistic cultivation, but for my incorrigible perversity and aversion to all that was noble, elevated and artistic. In a word, I have buried my future, but it could not be otherwise. I am serving as an ordinary Gypsy in the orchestra, and am a favorite with the public, since I still play the violin tolerably well." He had married a Gypsy of the same place and had one son, whom they christened Franz, after the beloved Liszt. As long as he lived and even after he was gone, the picture of his benefactor Liszt would be preserved as a holy relic. I have tried hard to analyze Gypsy music, to put into words the difference between their wild, wierd melodies and those non-Gypsy. But to do so, I think one must be Gypsy born. The national dance called czardas (meaning inn), has been described with the following interpretation: "A tale of wooing and winning. There is the lingering, appealing tenderness of the soft commencement, then a hurried, passionate movement of impetuous urging, the angry grief of a repulse, the repetition of the first slow sweetness, and then a rapturous finale, ending with a grand harmonious crash." Those of you who have read the story of Annabel Lea will remember this stanza:

"The white moth to the closing vine,
The bee to the opening clover,
The Gypsy blood to the Gypsy blood
Ever the wide world over."

SOME CURIOSITIES OF MUSICAL NOTATION.

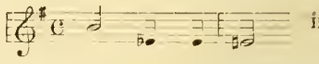
FREDERIC S. LAW.

The German musical nomenclature is peculiarly adapted to what may be termed musical puns. In addition to the first seven letters of the alphabet to designate absolute pitches, as in English, the eighth is used as well. H denotes B natural, while B indicates B flat only. This anomaly arises from the peculiarities of early notation; or, rather, it had its origin at a period when there was no notation, as we understand it, when tones were represented by letters instead of notes. Short scales of six notes, therefore called hexachords, were formed; the first one began on G, first line of the bass staff, and was followed by others, beginning on successives C's, F's and G's. These hexachords had one half-step which came between the third and fourth tones. This occurred naturally in the hexachords of G and C, but to secure it in the hexachord of F it was necessary to lower the B a half-step. Thus, there were two kinds of B's: one high in the hexachord of G, and one low in the hexachord of F. The latter was represented by a Roman b which, in time, became the character we know as a flat; the former was indicated by a black letter B, ♮, and this, in Germany, finally received and retained the name of H from its similarity to the German letter of that name. From the character the natural, ♮, was evolved, and, later, the sharp, ♯. Josquin de Prés is said to have been the inventor of the sharp by cancelling or crossing out the square—B—to show that it was to be raised instead of lowered. In German the key of B flat major is *B dur;* the key B major is *H dur.* The corresponding minor keys are *B moll* and *H moll.* The German term for sharp is *is;* for flat is *es.* These are affixed to the letters, thus: F sharp, *Fis*; D flat, *Des.*

German composers not unfrequently take advantage of these peculiarities in forming themes. For instance, the name of Bach has always been a favorite

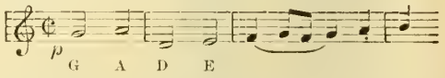
subject for fugues; vide, Schumann's and Liszt's fugues on B-A-C-H.

Adoph Hesse composed a prelude and fugue in E minor for the organ based on his own name,

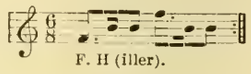


H-Es-Es-E. In a foot-note he apologizes for the affectation of using E flat to represent D sharp on the plea that the former was necessary in order to spell his name correctly.

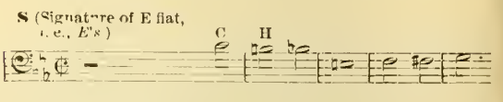
The Scandinavian composer, Gade, has a musical name in more ways than one, as will be seen by the theme of a fugue—



in which Raff preserves the memory of his friend. Another, dedicated to Ferdinand Hiller, is hardly so successful, *e. g.:*

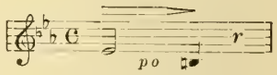


Schubert's devoted friend, Stadler, made a still farther fetched effort to incorporate the composer's name in the subject of a fugue which he dedicated to his memory:



Fesca begins one of the movements of a quartet with the following phrase, which spells his own name:

Spohr, in his autobiography, relates that this movement created much admiration, and that he, with Hummel and Pleyel, then in Vienna together, endured not a little good-humored raillery because their names could not be turned into music. He set his wits to work to see if he could not, in some way, link his name to a musical phrase, and finally evolved the ollowing:



This he used as a theme in a string quartet, Op. 29, No. 1. When he produced it for the first time at a friend's house it found great favor; the original effect of the descending diminished fourth was especially admired. Spohr then called those who had rallied him on his unmusical name and showed them how he had composed the much-admired theme on that same name. Naturally, they could not discover it by hearing since he took advantage of the abbreviation, *po.*, which was then customary for *piano*, and of an old-fashioned quarter rest resembling the letter R. This occasioned great surprise and general hilarity. Hummel and Pleyel were teased more than ever on the lack of music in the names since, by the utmost cudgeling of brains, nothing musical could be made of them.

A man's own estimate of himself is not always the scale by which others measure him. Recently a young messenger boy, while serving the manager, incidentally heard a solo by a famous pianist.

Later he was graphically describing what he saw and heard to his *confreres*, when one of the lads asked him:

"Could he (the artist) play?"

"Could *he play?*" repeated the hero of the incident, with a disdainful look at his interrupter; "could he *play!*—why he made his three legged one sound as loud as a Dago's street pianner!"

"LUCK."

The boy who's always wishing
That this or that might be,
But never tries his mettle,
Is the boy that's bound to see
His plans all come to failure.
His hopes all end in defeat;
For that's what comes when wishing
And working fail to meet.

The boy who wishes this thing
Or that thing, with a will
That spurs him on to action,
And keeps him trying still
When effort meets with failure,
Will some day surely win;
For he works out what he wishes,
And that's where "luck" comes in.

The "luck" that I believe in
Is that which comes with work,
And no one ever finds it
Who's content to wish and shirk.
The men the world calls "lucky"
Will tell you, every one,
That success comes, not with wishing,
But by hard work, bravely done.

TO THE POINT.

W. FRANCIS GATES.

Musical Sun Spots.

Musical criticism no more consists, nor should consist, in finding one possible defect in a musical performance and magnifying it to the exclusion of numerous excellencies, than astronomy consists in the search for and publication of a small spot on the sun, to the exclusion of its grander and more important features.

Yet, in many criticisms we read and hear, the main feature seems to be this search for this sun spot and the magnifying of it into a serious and reprehensible defect.

A pianist, an artist, may play a program of some fifteen movements or compositions, and, omitting his good points, the musical mentors of a community will at the earliest opportunity by word or in print find the sun spot,—some fault with a gradation of tempo or a shading of touch. That the artist has made a life study of his instrument and has enjoyed the best of advantages, perhaps with a Liszt or a Kullak, counts for nothing with those whose delight is to use a microscope on the sun.

One may prefer certain points in interpretation given in other ways than those chosen by the artist; but shall he for that reason cry out to the public, "Hold! There is a spot on the sun. Lo, I have discovered it!"

It is right and proper that each person should have his own opinion of all musical work that he hears, that opinion being based on the best educational advantages possible; but it is not well therefor for each to exalt himself into the unenviable position of a herald of sun spots of artistic blemishes. It is well for each to have his own opinion; better a poor or worthless opinion than none at all. And it is equally as well in a majority of cases to keep it to one's self.

But as an artist said to me not long since, "That's all right. Let the critics find fault. They must do just about so much of it to let the public know how very much they really do know. It would not do to unqualifiedly praise a thing. They must find fault to keep up the appearance of musical erudition."

Furthermore, this hypercritical activity is apt to do harm, in its newspaper manifestations, to those in the formative period of musical life. For instance, Miss Aramintha Brown-Jones is to give a piano recital. A gracious providence will no longer protect a defenseless public; the inevitable is about to occur. At this recital her playing is faulty as to technique and crude as to interpretation. But the next day the local paper lauds her as a second Rive-King, and the immature students who have heard her naturally suppose from the newspaper laudations that she is a good model to follow.

Shortly afterward comes a recital by an artist of high standing and immediately fault is found with some feature of nuance or tempo, or his playing may be characterized as wooden or metallic, or likened to any other material that occurs to the writers fertile brain. By this the student is practically informed that she should copy the crudities of the fair (and beautifully attired) Aramintha rather than to take the artist as a model.

One of these articles may be written by the musical editor, presumably well fitted for his position, and the other by the sporting editor, there having been that night a dearth of prize fights, he was assigned to write up the athletic qualities of Miss Brown-Jones. Now these two articles appear in the same columns of the paper and the guileless reader is unable to distinguish the one standard from the other.

And in this is a good argument for signed criticism. Then when we have the honest opinion of a man who is capacitated by years of musical study to have an opinion, and, who has the courage to sign his name to it, the student can distinguish between that and the rhapsodies turned out by the verbose editor of the department of athletics. The signed criticism has a distinct value—plus or minus—according to the standing the writer holds in the musical community in which he moves.

The bed of such a critic may not be made of roses, though his path will probably be lined with thorns; but he will be a power for good in his community and deserving of good words and good treatment by both amateur and professional. Yet, should he hope for these, he will only show his inexperience for they are generally lacking in this life, however much of good is said of him after he is dead.

***

The Price of Greatness.

When we speak of a man as being a great man, we practically say a tried man. Some way or other it seems that genius cannot be brought to its full fruition save by trial and tribulation.

Musical history is full of examples of this truth, a truth so general in its application that it is hard to find exceptions to it. Yet some are more notable by the depths of trial they had to pass through than others, and of these we will here speak of but two, Wagner and Beethoven.

It does not take a very close reading of Wagner's life to discover the immense obstacles that surrounded him in his earlier days and during the time he was writing and hoping for a performance of his earlier operas. If his life has in it a lesson for the student, it is that of perseverance combined with a reasonable self-respect and a fixed belief in the talent that one knows he has in him.

The days of stress and trial at Dresden, Konigsberg, Riga, Paris, London, Zurich,—these did not make the man, but they developed the germ of greatness that was in him; by their trials and poverty and repression they made of Wagner a greater man than he could possibly have been without them. Trial seems to be a necessary element of true greatness.

And we have recently passed the season when Beethoven's birthday was brought to our attention. And if this reminder has led us to turn to his biography, we have found just such another life of discouraging environment, and trouble and obstacle. And the same lessons are taught by Beethoven's life that are impressed on us by the struggles of Wagner, against a seemingly unpropitious fate. The same poverty, the same non-appreciation, and, more than this, in later years the physical infirmity that to a large extent cut him off from his friends and from hearing even his own compositions. Few of the great composers seemed to escape such troublous environment, save perhaps, Mendelssohn and Meyerbeer. Trial and warfare seem to be the price of greatness.

Let us begin to fear, then, if our lives are running too smoothly. Where there is nothing to combat there is apt to be little strength gained. Where our surroundings are too pleasant and our lives spent on "flowery beds of ease," we may well fear that our mental and musical development is not what it might be or what some such tried brother is achieving in spite of the difficulties and trials that surround him.

Mr. H. T. Finck, the well-known musical critic, has reproduced a word-sketch of Verdi given to him by a French journalist who visited the composer in 1845. Verdi was then a young man of thirty-two. "In person Verdi is extremely handsome, with chestnut hair, and blue eyes that have an expression at once soft and vivacious. When he speaks his face lights up, and an incessant mobility of expression reflects the varied feelings that are passing within him. * * * His tastes are the most simple in the world. The room in which he works contains no furniture but four or five chairs, his piano, a statuette of himself, and over the piano a frame to which are suspended three coronals, and within the frame the words 'Le chemin de la postérité.' The words of this young composer are so sought after in Italy that they command their weight in gold, and he has already realized a handsome fortune."

OVER THE COFFEE CUPS.

At Dresden, one evening, Mozart's "Magic Flute" was to be given, conducted by Weber. The moment to commence was drawing near, when it was observed that the score of the opera had not been placed on the director's desk. Great consternation was among the musicians. The court was expected to arrive at any moment, and the orchestra well knew that Frederick August would be enraged did their instruments not burst into harmony as soon as he appeared. The anxiety extended to the audience; Caroline, the wife of Weber, looked at the empty desk before her husband with agitation. Weber saw the danger, but he smiled and, without losing *sang froid*, sent some one to search for the score; but the court entered at about the same instant. Weber glanced at his trembling wife to reassure her, grasped his baton, gave the signal to begin, and conducted the entire first act of the opera from memory, without a note of the music, with his usual vigor and ability, even amusing the orchestra by pretending to turn the pages at the proper moment. The affair soon became noised about and reached the ears of the royal family who personally overwhelmed Weber with compliments.

One evening an old friend of Auber's was descending the grand stairway in the Opera House, Paris, with the composer and remarked: "He, he! my friend Auber we are growing old." Auber laughingly replied: "Well, well! What else would you have us do? To grow old is the only way to live a long time."

The Regent, by whose orders Voltaire was a prisoner in the Bastile, at the time of the first representation of his tragedy, "Œdipe," was so delighted with the piece that he liberated the prisoner. Voltaire presented himself before his highness and thanked him, to which he replied: "Be prudent, young man, and I will take care of you." "I thank you kindly," responded Voltaire, "but I beg you not to bother about lodging me."

The train was rolling toward the French frontier; it would stop at the douane in a few moments: A traveller, in a first-class compartment, was busy taking out packages of cigars, that he had stored in every corner of his valise, and was trying to tuck them away in his pockets; unhappily he had more cigars than pockets; but being a man who has never stumped by such a trivial matter, he turned to his neighbor and, with a smile, said: "Mr. —eh! if it will not bother you, would you mind taking charge of these four packages of cigars while we pass the custom house?" "I ask nothing better," replied the gentleman, with an affable smile, "but I may be tempted to hang on to them." "Oh, I'll trust you," returned the other. "Perhaps not now, when I tell you I am the custom house inspector." The traveller, with his coat bulging with cigars, lost his presence of mind and, we judge, his cigars also.

IT'S SUNSHINE AND MUSIC.

A laugh is just like sunshine,
It freshens all the day,
It tips the peak of life with light
And drives the clouds away:
The soul grows glad that hears it,
And feels its courage strong—
A laugh is just like sunshine
For cheering folks along!

A laugh is just like music,
It lingers in the heart,
And where its melody is heard
The ills of life depart;
And happy thoughts come crowding
Its joyful notes to greet—
A laugh is just like music
For making living sweet!

—*Ripley D. Saunders, in St. Louis Republic.*

In the midst of popular applause how dissatisfied an artist feels with his own work.—*Gretry.*

Oh, surely melody from heaven was sent
To cheer the soul, when tired with human strife.
—*Kirke White.*

Bad fiddlers and violinists show us what a fine art music really is; for white shows plainer in contrast to black.—*Luther.*

VIOLIN STUDY—SOME DISREGARDED QUESTIONS.

GEORGE LEHMANN.

The average teacher, as well as the average pupil, has the unfortunate habit of countenancing deficiencies on the ground that time, labor and experience are magic-workers which may safely be trusted to remedy the great majority of musical evils. When, after ordinary effort (or, for that matter, no genuine effort at all), the pupil fails to master a more or less serious difficulty, the teacher is apt to shrug his shoulders and exclaim, "we will not worry about this matter just now—the future will take care of this difficulty!" Surely the pupil is not eager to press a point which his teacher so readily abandons; and thus the true opportunity of making progress is lost, and mental discipline continues to remain a question which is either feebly encouraged or wholly unheeded.

Admitting that the solution of many problems in violin playing is greatly dependent upon time, labor and experience, and that some difficulties can be overcome only with the development of years and a riper general understanding, the fact remains that there is in study no greater enemy to progress than this underestimation of the possibilities of youth, and this weak abandonment of temporary difficulties. The whole principle is wrong. It develops slovenly technic, establishes false ideas, creates low aims and dulls appreciation of what is truly beautiful. The "good enough for a pupil" principle cannot be too strongly condemned; and though we see it encouraged every day by teachers who ought to be able to recognize its dangers, we also have impressed upon us its lamentable results.

The general treatment of grace-notes, both as to their time-value and their character, is reprehensibly superficial. All young pupils possessing a reasonable degree of intelligence, will have no difficulty in perfecting themselves in the playing of grace-notes, if the teacher has the knowledge and the wish to enlighten them; yet one rarely hears a pupil play a group of grace-notes with even a fair understanding of their character and value. The pupil should clearly, thoroughly understand that the character and degree of rapidity of any group of grace-notes are dependent upon, and determined by, the character and tempo of the composition as a whole. This is the first consideration. Fully to illustrate this would require far more space than is here available; but all earnest students will quickly appreciate my meaning if they will play two different compositions, one of which is in a slow, the other in a rapid, tempo, and both containing many embellishments in the form of grace-notes. They will soon understand that, necessarily, the time-value of the various groups of grace-notes is arbitrary, and that their beauty depends upon their conformation with the general plan and character of the whole composition, and, in particular, with the phrase which they embellish. And a point in the playing of grace-notes which must never be forgotten, is that of the temptation to make the highest note predominate. The accent in the following group is, of course, musically wrong, but nine players out of ten unconciously accentuate in this manner:

One of the many troublesome questions in violin playing, as well for the advanced player as for the inexperienced pupil, is the judicious employment of the fourth finger. Since no set rule can be applied to this question, and since the player has so frequently a choice between the fourth finger and the open string, musical instinct and experience, rather than definite knowledge, are required in the solution of such a musical and technical problem. But knowledge is surely requisite—knowledge of phrasing and tone-balance, in particular. Often, however, an artist's frequent employment of the open string is merely characteristic of his own style or of the school in which he has been trained; for, without violating any musical or technical laws, his use of the opon string is obviously the result of training or individual preference.

Every player, at some period of his development, is hampered by the natural weakness of the third and fourth fingers. Recognizing this digital weakness, the teacher prescribes some finger exercises that are well-known and in common use, and calmly awaits the good results which he erroneously believes to be inevitable. Such treatment will, it is true, prove more or less profitable to the pupil in a general way; but too often the very weakness which such finger gymnastics are supposed, and intended to cure, remain either unaffected, or at best, are not removed.

Such unsatisfactory results are not due to the fact, that the well-known sets of finger gymnastics are either poorly designed or less meritorious than their authors intended them to be. In reality, they achieve some general good in nearly every case; but they fail to reach the heart of the question under consideration. The explanation is, indeed, very simple. Each individual hand has its peculiar, individual weaknesses, and these weaknesses requiring, as they invariably do, specially constructed exercises, defy such finger exercises as are calculated for general technical improvement and development.

The very meaning of digital weakness is not always clearly understood. The third finger, for instance, may, in general technical work, fall with admirable strength and precision; but now and then the player makes the annoying discovery that, despite the apparent possession of strength and accuracy, his third finger always refuses to obey his will when certain technical *combinations* arise. This clearly proves that the finger requires special gymnastic work—work which must agree in nature and design with the peculiar combination of notes that discloses the digital weakness.

In bowing, there is one weakness which few pupils escape—a weakness which, originally, is the natural result of inability, and which owes its constant increase to timidity and misapprehension. I refer to the player's inability to control the lowest portion of the bow. It is not at all difficult to understand the pupil's reluctance to utilize the "heel" of the bow, for there he encounters a difficulty which often resists long and tenacious experiment. But the real obstacle to overcome, after all, is the tendency to shun entirely this portion of the bow—a tendency observable in all pupils, in some degree, and very marked in the playing of the majority of young pupils. That constant avoidance of a certain portion of the bow must soon result in chronic weakness is a fact so clear and simple as to require no further elucidation. The remedy consists of no complicated process requiring several hours application daily, and it is therefore all the more astonishing that pupils who are afflicted with this weakness make so little effort to overcome it. The teacher, of course, is greatly to blame, for it is manifestly his duty not to tolerate the formation of bad habits. All players who find themselves systematically avoiding the lowest portion of the bow, can effect a permanent cure in an incredibly short time, by means of the following absurdly simple method: Be observant of every up-stroke, and persistent in pushing the bow to its extreme length. The first efforts may prove disastrous, from a tonal point of view; but each new effort will prove a point gained in the elimination of timidity and the establishment of self-confidence, and the old fear and inability will quickly give place to an assured and well-controlled stroke.

Yet two more questions, viz., broken chords and the stroke known as the *martelé*.

That the study of broken chords is a highly important one, must be self-evident to every student capable of giving the question intelligent consideration. In all literature for the violin, covering the entire mass of studies and solo compositions, it would perhaps be impossible to find one page which contained no broken chords. This is not because this form of musical utterance is characteristic of violin technic, but because it can hardly be avoided in musical expression in general.

The study of broken chords should be considered in the light of a sister study to scales, for, like the scale, the broken chord is, so to speak, one of the vital organs of technic. Broken chords should be studied vigorously and systematically, beginning on the open G-string with the chord of G major. It is hardly necessary to lay emphasis on the injunction that the more or less advanced player should practice all broken chords in three octaves, including the minor chords.

Careful and persistent study of the *martelé* stroke will richly reward every student. This stroke has always been developed to a high degree of perfection in both the French and Belgian schools of violin playing; but in Germany its importance is either underestimated, or the German pedagogue has not yet mastered its subtle difficulties.

Music is not a science any more than poetry is. It is a sublime instinct, like genius of all kinds.—*Ouida.*

EARLY VIOLINISTS COMPARATIVELY CONSIDERED.

What Each Brought to the Technic of the Instrument.

H. W. HART.
Author of "Arranging Music for a Small Orchestra."

[*Continued from April.*)

One of the most noted pupils of Corelli was Francesco Geminiani, although his vivacious and, in fact, eccentric character was entirely at variance with that of his calmer master.

He was born at Lucca, Italy, in 1680, and received most of his instruction from Corelli at Rome. In 1714, he went to England, and soon became famous as a virtuoso, although more of his time was spent in teaching and playing at the homes of the nobility, by which means he supported himself, than on the concert stage. He seems to have made but limited use of his unquestionable talent as a solo player, and thus failed to secure the position in life which might have been his, by neglecting his opportunities, and wasting much time in writing comparatively valueless treatises among which may be named "A Treatise on Memory," "A Treatise on Good Taste," "The Art of Playing the Guitar," "The Art of Accompaniment."

Violin playing at this time in England was in its infancy, and Geminiani, when he did play in public, amazed his hearers not only by executing with ease the Concertos of Corelli, which were considered to present almost insurmountable difficulties, but also by introducing freely into his own works the shift, and by frequent use of double-stops.

His most valuable contribution to the literature of the violin, however, is his "Art of Playing the Violin," the first book of its kind ever published. It embodies the principles of the art as established by Corelli; the rules for holding violin and bow, the management of the left hand and bow-arm being the same as those recognized now.

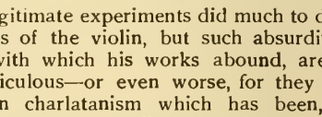
By far the most important inovation is the recommendation to hold the violin with the chin on the left side of the string-piece, a practice now universally accepted as indispensable to the highest perfection of execution; but which had never been done before Geminiani, and which, strange to say, was not even then generally adopted until the beginning of the present century.

Geminiani died in 1761, at Dublin, where he was visiting his pupil, Dubourg.

The technical improvements in violin-playing which we have mentioned, were all logical and legitimate developments of the art. But excesses had not been wanting among some of the greatest executants, although not the greatest artists in the true sense of the word, as shown by these very extravagances.

One of the most rabid of these devisors of intricate but senseless difficulties was Pietro Locatelli. And, considering the character of his master, it is surprising to note that he was a pupil of Corelli; for nothing was further from the desires of this serene genius or from the nature of his life-work, than these meaningless appeals "to the gallery." But his pupil, Locatelli, seems to have revelled in them. His "La Labrynth," one of a number of caprices, discovers such passages as the following:

and,



His legitimate experiments did much to develop the resources of the violin, but such absurdities as the above, with which his works abound, are senseless and ridiculous—or even worse, for they set an example in charlatanism which has been, in many instances, only too readily followed.

Pietro Locatelli was born at Bergamo in 1693, and became a pupil of Corelli at Rome in his early youth.

The recorded incidents of his life are meager, but he appears to have travelled to a considerable extent. Later, he settled in Amsterdam, where he established regular public concerts, at which such feats of execution as we have illustrated were displayed to amazed and applauding audiences. This characteristic of his inspired a later writer to dub him "the great-grandfather of our modern Finger-heroes." He died in 1764.

THE EDUCATIONAL VALUE OF RHYTHM.

MRS. CROSBY ADAMS.

When John Ruskin, who was indeed a seer, said—"Nothing is of the least use to young people, or, for that matter to older people either, except what interests them," he spoke a profound truth. The wise teacher is he who can divine the point of view of his pupils—be they of tender or mature years. And having adjusted the lens of his own vision to the vision of the child, he can see "large things small, and small things large" if need be, that together, hand in hand, teacher and pupil may walk toward truth, that truth which unfolds to the individual his *own* perception and not another's.

The student who understands human nature as well as music, must have observed how closely rhythm touches the race. It is needless here to trace the history of the art through its first expressions of rhythm, melody and harmony—the three elemental factors which constitute music. But as the history of the child is the history of the race, our chief concern lies in studying the place rhythm should have in the child's life. Those who have made the closest study of this matter, and who have regarded the subject in relation to the whole, are clearly alive to the possibilities of development by this means. To have "music in one's soul" there must be the awakening of the perceptions of the child, first, through rhythm which he can express very early in life, second, through melody, the little etched outlines of music, so beautiful when allied to the form which rhythm helps them to, and then the dawning consciousness of harmony. This brings us, at a later stage, to a full realization of all that music holds. I cannot help thinking that if the relationship of these three elementals were carried out logically and in sequence, there would be a much greater number of people who would enjoy those highest of musical forms, chamber music and the symphony. These at present appeal only to those whose perception of music is clear, and who feel these three factors in their proper relation. For it is so easy to see that the larger mass of people enjoy rhythm best, a smaller number perceive rhythm and melody, and a still smaller proportion enter the domain of art in its complete unity of rhythm, melody and harmony.

It is manifestly a duty to open these, as well as other avenues to the soul, as early as possible, by surrounding the child with the atmosphere of music and also by inviting him to share with us in its expression. And it is obvious that one of the first means at his command is rhythm. We have all seen cases where the adults had not been allowed full use of such opportunities and could neither walk in step, dance, or sing in time, who, in fact, found the *first* of the doors which open into music, closed to him. That such a lack is a *loss* no one will dispute.

During the early formative years then, these influences must come in upon the life of the child, unconsciously enriching it. Beginning with language, it is a well attested fact, that the charm of words to the baby are found most effective when allied to rhythm, either by verse or line. The little one's attention can be secured by the iteration and reiteration of gibberish even, and, since the words in themselves can have no meaning at such an age—it is undobtedly the rhythm that appeals. Take that travesty on the Chinese language, "Ching, Ching, Ching, Chi, Chi, Chi, etc.," through its six lines and you will notice its charm to the child at once, while the "Pat-a-cake" song is a never failing source of delight to both mother and child, who thus institute the first "action play."

Perhaps nothing is more fascinating in all the literature suited for babyhood time than the little French jingle, illustrated by the adult with fingers and hands, which are in rhythm with the words. This couplet runs

"Qu' est-ce qu' ils font, font, font,
Les petites Marionettes?
Qu' est-ce qu' ils font, font, font,
Les petites Ingenues?

What is it that they do, do, do,
The little Marionettes?
What is it that they do, do, do,
These ingenious little creatures?"

and is the very first verse told to the babies of France. Its alluring cadences fall upon the ear of one even unaccustomed to the language, and it appears to have a continental reputation, as the writer has seen a Russian and his English wife both show unmistakable pleasure at this fragment of their childhood's days came to their notice after long years had passed. They at once illustrated it with evident glee. Like many another of the sort, its charm lies in the language itself, as the magical effect is lost by a translation.

A recent little visitor in our home related various Mother Goose rhymes, really valueless in themselves as literature, yet holding the attention of each generation in turn. Is it not the rhythm that holds us spellbound as we listen to the cumulative verses of "The house that Jack built," and other remarkable products of this and other kinds? A beautiful contribution to our best literature for children, a poem in very truth, full of the artistic touch and yet replete with rhythm, is found in Miss Emily Poulsson's "The Pigeons," which begins

"These are the eggs so smooth and rouud,
That held the wonderful seeret.

This is the nest where the eggs were found,
The pretty white eggs so smo th and round,
That held the wonderful secret."

going on and on with gathering interest to child and adult, a lovely lesson throughout.

The student of folk-lore has found no more enticing path than the study of children's games. Kindergartners have been busy evolving the elemental principles which make these games so attractive to the children, and come always to the conclusion that it is rhythm first, last, and always, that makes their "calling and adoption sure." Have we not all joined a circle to

"Ring arouud a rosy
Pocket full of posy,"

or formed a line, saying

"As we go rouud the mulberry bush
The mulberry bush, the mulberry bush
As we go round the mulberry bush
So early in the morning."

Or, if perchance we were going to play that game where you "count out" and some one must be "it" have we not all said

"Intry mintry cutry co n
Apple seed and apple thorn
Wire briar limber lock
Six geese in a flock,
One flew east and one flew west
And one flew over the cuckoo's nest,"

or its equivalent in some form or other?

Granting then, that rhythm has not only an educational value, but is a natural and healthy craving of the human soul, since all nature is set to rhythm, shall we not also as teachers of piano students, enlarge our horizon sufficiently to take in this need of the child who asks in no uncertain tone for a "march," "a two-step," "a waltz." What teacher has not been confronted and confounded by this request! It is the wise teacher who grants it, and sees to it at the same time, that the best available material suited to that stage is provided. And herein lies the difficulty, for many pieces of this order are too difficult for young players. The writer, after many years of teaching experience, unhesitatingly affirms that rhythms should be given when the case demands it. To provide something refreshingly rhythmic, which is neither too difficult or too commonplace, is not an easy task for a composer. In this collection, "Musical Rhythms," an effort has been made to contribute to the demand for this phase of music. It is hoped that Kindergartners may find the book of service in awakening a responsiveness in the children, and that those piano teachers who are casting about for suitable material, will find these numbers may stimulate and help the pupil towards a stronger appreciation of good music. One must be willing to build upon the honest convictions of the child, and not graft upon him an adult consciousness, which has been so gradual in coming to us that we forget how *our* musical culture has been formed, it has been so imperceptible. Yet we are only too ready to lay our opinions upon the child, unless we reflect that he, too, must evolve his own consciousness of what is of true and of good report by assimilating whatever appeals to him at the different stages of his evolution. No one has the responsibility of the teacher more at heart than the writer, but she believes that we have had far too little sympathy with the child's love for this first phase of music, and that by satisfying this desire, we shall enable the pupil to enter into a fuller consciousness of the parts of music that go to make up the whole.

It is only by diving into the deep mysteries of harmony that we have been enabled to express the more delicate shades of feeling.—*Schumann.*

SOME THOUGHTS ON ETUDES.

Let us open Couperin's "L'Art de toucher le Clavecin," published at Paris in 1717, and gaze at the neat set of progressive exercises, preludes, extracts from movements of Couperin himself. In these, and also in the careful comments with regard to the rendering of ornaments to the playing of accompaniments, we see that the old French master was bent on making musicians and not mere players. He treats not only *du toucher*, but *du beau toucher du Clavecin*. There is a piece of advice in this old book to which heed might probably be paid in these days. It cannot be followed to the letter, but attention to its spirit might lead to less of the practice-this-exercise-ten-or-twelve-times, or play-over-this-difficult-passage-a great-many-times system of ordering a pupil how to prepare for the next lesson. Couperin says: "It is better during the first lessons for children not to practice in the absence of their teacher. Young folk are too flighty to submit, and to hold their hands in the manner prescribed. As for myself, when children are first placed under my care, I take the precaution to carry away the key of the instrument on which I have taught them, so that during my absence they may not in one moment disturb what foundation I have carefully laid during the space of three-quarters of an hour." Only genuine teachers will appreciate the wisdom which underlies this simple statement.

Now let us turn to another and even greater teacher, Bach. It seems, indeed, wonderful that so mighty a genius should have had the patience to teach. Here, however, it is not the fact of his having bad pupils—and, by the way, many of them—but what he taught. He began to teach his son, Wilhelm Friedemann Bach, when the latter was only nine years of age, and he put before him compositions of progressive difficulty (preludes, allemandes, minuets, chorales), and, so Spitta tells us, "even let the boy himself write some." Then, to take a pupil of more advanced years, there was Heinrich Nikolaus Gerber, to whom Bach gave, and for "thorough" study, his Inventions, Suites, and the Well-tempered Clavier. It may be said, and with some truth, that Bach's teaching was quite exceptional. In giving his own music to his pupils to practice it was so, yet we find other cases in which music of a similar character was put to pupils. At that period, and this is the point we wish to make, there was no special book of exercises. Both Handel and Bach we know collected movements from various quarters, and of the Gerber mentioned above we know something of interest previous to his becoming a pupil of Bach. When only thirteen years of age he made a neat copy in a book of various preludes (Pracambulen), fughettas, and other short pieces which his teacher recommended him to practice. Gerber was born in 1702, and the book, which has been preserved, contains pieces by Pachelbel, Buxtehude, and other composers of that time. The words above within quotes deserve a moment's attention. We know that thorough-bass formed an important part of Bach's system of teaching, but allowing a mere boy himself to write out some pieces was a very wise practical step which might now be imitated with advantage by teachers.

The idea of publishing selections of studies seems to have suggested itself first to the esteemed teacher of Mendelssohn, Ludwig Berger, who edited and published 12 Cramer Studies. Clementi and Cramer each wrote 100 studies, and perhaps even in their day the large number proved somewhat depressing. Beethoven also made a selection of Cramer studies for the use of his nephew Carl. Since Berger, his example has been followed by singularly able men: for Clementi, Tausig and Buohamici; for Cramer, Köhler, Bülow, and Pauer. The original collections, although containing for the most part excellent music, were too large, and this must have been felt more and more after the modern writers already mentioned had begun to attract attention. Various works extensively used for many years are being gradually superseded by such selections, or by acts of studies culled from various sources. Such a plan offers refreshing variety. The very title, for instance, of Czerny's elementary work has an alarming sound. One hundred and one exercises! To children the number sounds forbidding; many, indeed, while plodding through page after page must wonder whether they would ever get to the end. The work of selection can only be done by a musician of great experience. Pupils and amateurs would, if left to themselves, merely pick out what suited their fancy; a wise player and teacher selects those studies which give the fingers an all round training, enabling players to interpret music of various periods and various styles.—*J. S. S.*

THE VOICE.

MR. FRANK HERBERT TUBBS, Associate Editor.

THE SINGING VOICE.

ARTICLE TWELVE.

FRANK H. TUBBS

Singers, like poets, are born and not made. If a reader thinks by that that we mean that no training is needed to make a singer he will soon learn his mistake. We do mean that the making of a singer is present in every person, and on that account singers are born singers. Some try to sing on the supply of natural gifts and for a time they can succeed up to certain limits. But singing life is short. Instead of having it last "three score and ten years," which is the span of life in music, "born singers" last barely five years. We all recall some who make phenomenal successes and are heard from often and prominently for a few years and then they disappear. They can sing no more. Why? They had no training. More than that, they did not know what training means. Perhaps they had a few singing lessons; and really all that can be shown a student in vocal training can be condensed into a few lessons, but they did not continue the training afterward. Real training in singing is mental rather than physical. The practice consists of getting so as to do things right, and then, all-important, holding the mind to that training. The latter is lost to one who stops practice and, really, that is all there is to practice.

A singer who is great is merely the completed gymnast in vocal science. He has a superb body modelled on perfect lines. We are taught to look at the ancient Greeks and to be like them. We forget, however, that the Greek of the celebrated games was a finished product. He was not born an athlete. The life of the ancients conduced to perfect production of the body and steady and symmetrical growth to maturity. He was more in the open than are our boys and girls; he lived in more regular times; he had better habits. But even under his choice conditions of birth and rearing he needed rigorous development before he could compete in the games. The training of the singer must be on physical lines and there must be much of it.

We are also told to behold the perfect animal and be like him. Again, do we forget. The animal is not the product of generations of "free will," which may have shaped you and me into something imperfect. Very few persons live who are perfectly formed. One shoulder is down; one arm is longer than the other; a hip is higher than its mate. Even the expression of one side of the face is different from that of the other. The beginning of training seeks to remedy these defects and to make a perfect animal. Man is naturally the most perfect of all animals. He was last made and the expression of Divine thought had not lessened in strength and purity. (Following this thought we find why woman is more beautiful than man. She is stronger, too, although common opinion says nay.) It is by the error of mental influence that man has lost his estate and by the reform of that must he reform his body. Any system of singing which begins and ends with voice training on the physical plane, ignoring the mental influence, is wrong and will fall to earth. But that is away from the story. By the right training the mind and body become attuned to musical expression and it must be constant. It should begin with the maturity of body and continue till the trembling voice of the decrepit old man or woman arrives. Training should be in standing, sitting, walking, breathing, diet, clothing and conversation. These all prepare the way for singing. The latter is an art and every art has its special preparation after the maturity of physical training. Who of us know how to stand, sit and walk? Who is using them as a step toward vocal training? Shall we have lessons on those things in these columns for you? You must say.

ELEGANCE.

Some one has said that the training of a child consists of "Don't" oft repeated. The boy brought up in the wigwam of the savage must curb many expressions, which are cub-like, before he will appear well in the city drawing-room or he will provide as much fun as does a cub. Art cannot use cub manners. Art must express beauty, refinement and emotion.

The word "Don't" is a poor one. It may curb but it seldom instructs. Far better is it to supply direction of what to do, and, as good overcomes evil, the use of what is good will eliminate the fault we would correct. In physical culture elegance comes from expression of culture and refinement of heart and intellect. The very thought of elegance quiets the pulse and curbs meaningless expression. Adding to that the idea which is to be expressed, whether it be of interest, sympathy, affection, laudation or praise, sends the thought to the various members of the body in such manner that they express elegance. The first use of the mature and trained body is in gesture. Every motion of hand or foot, of head or toes, of facial muscle and eye is a gesture which means something. These must be mentally directed and not allowed free play. We must have something in mind to express. If an idea is held there and we move any member, even in a small degree, we will manifest that idea. Pantomime is an art springing from mind. That which lies back of it is emotion. Our singing uses the beautiful and that in some form, being mild, the gesture and expression of the physical parts will be in accordance with it. The basis of elegance is sympathy; its highest expression is in the genial voice. That kind of tone which expresses the kindly, loving nature is the basis of voice culture.

How many can make a graceful gesture which is directly to the point? That is, which expresses, in elegant form, the idea in mind? Try to reach out the hand, as if about to shake hands with some one, and say, "How do you do?" Many will find that the arm describes a curve. This is not direct. One should then practice until he can make such gesture in straightforward manner. When he can do so gracefully and "at ease" he should use the voice with it. Let the sentence be, "How are you?" with stress (sustaining the word "are" a few seconds). This will tend to open the throat and give beauty of vocal utterance. It is the first step toward elegance in singing. The same idea carried out when songs are sung will, in time, secure beautiful singing.

SECONDARY RESONANCE.

Not all points in voice culture are clear, to the average student, until he has demonstrated the instruction upon himself. He may know what to do, but he needs to do it and continue to "do it" until it becomes part of his method. We may show students that it is possible to reinforce the initial tone almost indefinitely, but he must do it himself before he is certain it can be done. First attempts may not give him results. It is the persistent student who eventually succeeds. Primary tone is made at the larynx. That tone is reinforced by reverberation in the various air chambers within the body and by vibration through the material parts which surround those chambers. This is secondary resonance, which is the most important thing in voice culture. Reverberation in chambers of air can quickly be understood by pupils, for it seems reasonable at once. Any one can understand that a tone can be increased by such reverberation because so many things in constant use demonstrate it. The megaphone is capable because it gives room for reverberation of initial tone. Hold a tuning-fork over an empty jar and tone is louder. Sing into a cavern and tone is reinforced. In the same way the chambers of the mouth and nose reinforce the initial tone made at the larynx. Pupils can grasp this and use it.

Not so easy to understand, is it, as to the vibration of solid bodies? Such vibration is really the more powerful of the two kinds. Let us try to clear up this point. At the piano press down the damper (commonly called the loud pedal), press down without sounding any key, which is that of a note in middle voice, and hold it down. Then sing the note which is pressed down. Of course, it must be the exact pitch of the note or its octave. One will hear the sound made by the vibrations of the strings of that note sounding in consonance with the voice. In this case the voice gives the initial tone and the strings of the piano the secondary resonance. Try again, this time pressing down several keys on the piano, the same note in several octaves. For instance, with both hands on the keyboard, press down four D's. Then sing D. All the strings which are held down will vibrate in response to the voice and the piano will give out much more sound than it did when only one key was pressed down. This illustrates that material bodies reinforce initial tone, and that the more there are of the material bodies the more tone will be obtained. The illustration was cited to let the student see that such thing is possible.

The larynx is a voice box (as Behnke called it), but it is connected with all the muscles, cartilages and bones of the neck, mouth and head. Each of these material parts has sounding possibilities. When we can remove interfering effort (which corresponds to holding the loud pedal on the piano down) each and every one of these parts will add to its quota of tone to that made in the larynx. Such resonance added to the reverberation of tone through the air chambers constitutes secondary resonance and is the most important study in tone production. Teachers used to talk about bringing the tone forward and the above shows what takes place when we bring tone forward.

The illustration made with the piano gives only the idea. The secondary resonance produced with piano strings is very small as compared with that produced by the living body. When one asks where the tone comes from, which is awakened in the material portions of the body which respond to the initial tone, we realize that the answer must be one which does not have scientific or popular approbation. Science deals with material laws and goes up to a point where it can go no farther, because its material laws cease to work. Our day is learning that there are laws which belong to a realm above and beyond that of old science. There are laws of Life not yet fathomed by material scientists. The latter people refuse to look into them and cry "Mystery!" But the laws of Life are there and men are finding out some of their workings. When they are better known it will be seen that they are material, but far finer than material scientists have been accustomed to. Tone and its use come under this higher scientific study. The old ideas of tone have been tried and found wanting. Thinking people, who are working on tone and its use, see the coming of new ideas, but they have not yet grasped the new laws.

In answer to the query on where tone comes from in secondary vibration, we say, "Tone is an ever-present substance in all things. The vocal bands in the human being have the greatest known power in setting the latent tone into such action that it can be heard. The parts of the human body, near the vocal bands, are capable of similar sounding, but in less degree, awakening the ever-present tone within them. When the vocal band tone and the tone in all the other parts are aroused, simultaneously and completely, we produce our best voice and the most which we can make. That is the whole matter of tone production in a nutshell and it simplifies voice culture greatly.

The step in practice which gets this result is to "remove the dampers." In other words, take away tension which modifies and prevents vibration. The fingers on a bell stop its ringing; rigidity in any portion of the vocal apparatus prevents vibration. Teachers call for loose and free larynx. They don't explain why. They don't know, as a rule, why. It is to permit the larynx to vibrate into audible sound the tone which is latent therein. Teachers, also, say "Bring the tone forward." If they used the right wording they would say, "Let all parts of mouth, nose and face vibrate the tone which is latent in them." This is the true theory of voice-production.

Now, go into practice and utilize it. Use any vowel or combination of vowel; any consonant with a vowel, or combination of consonants; any group of words; any note or group of notes. The exercise used may be anything. Some exercises (like those employing *M*, *N*, *V* and *Z*) are better than others, but any will do. The secret of it all is to remove any rigidity which can prevent awakening vibration. That is the all-important point. Many students think that when they *feel* no strain they are not rigid, but there are little unfelt tensions which need to be worked out before perfect results come. This is one reason why

one can work best with a teacher. One who tries to do these finer things all alone, takes so long and doesn't know whether he is right or wrong, that he will be wise to have some teacher help him. The finer things are essential to producing an artist. Coarse material laws may govern the singer; the laws of Life must be worked upon to make the artist.

MEZZA VOCE.

The trend of these articles at present is toward artistic singing. Finish is needed as well as is primary drill. All teachers have been so attracted by fundamental needs that it seems as if the refinement of singing were forgotten. Seldom do we hear in the concert room or church the beautiful mezza voice, or half-voice, singing which every one had in greater or less degree but a few decades ago. In every age there are those who decry a lost art. We do not join that class, even if we do point out the abandonment of something beautiful. Let us return to it. To do so, we must incorporate it in exercise practice. It will never go into songs till it has been developed in exercises and vocalizes.

What is the mezza voce? Probably most teachers would say, as did Sims Reeves, "head voice instead of shouting the upper notes of the chest-range" Perhaps that applies to the upper voice in men and middle voice in women, but it does not express the idea. It is really the small voice—that voice made with the least possible action at the vocal bands. It applies to the chest as well as medium and head notes. In producing tone, nearly every singer grips the throat and forces breath against the larynx, which the latter cannot handle. The remedy is in starting tone with no felt motion in any organ; in continuing tone just above a whisper; in ending tone as if still intending to sing more. Really, there are three exercises in that sentence. (1) Start tone with "ah" four or five times, watching with mirror if necessary, the jaw, tongue and neck; secure ability to make such starts with no notion whatever. Do not seek (for this study) to try the second suggestion till that can be done. (2) Continue tone just above a whisper. It is well to whisper "ah," prolonging it two or three seconds and then singing with the least tone which can be made. Continue this on single tones until it seems pleasant and mellow. This calls into use secondary vibration to some extent. After one is sure he is making tones, "just above a whisper," on single notes throughout the voice, he can combine any number of notes. That means he must be able to sing scales and busy exercises in that voice. (3) After the tone stops make a "mental note." That is, act as if you were to sing again. It requires one to place all organs in the right position as if he were to sing, and allows him a mental view of how organs ought to be used to feel while he is singing. Modern singing, which is so strongly emotional, is the cause of forsaking the mezza voce. We must be ready for modern singing, but we must also be able to sing with delicacy. The full voice does not lend itself well to varieties of expression. Every song has "pictures" in it. Without the mezza voce one cannot well draw the pictures. He can but make the strong outlines. The shading must be left out. To compare with one of the trades, the singer with the full voice only at his command is the carpenter who puts up posts and sills, but who cannot do the finishing work of parlor decorations. Every singer can acquire the mezza voce, and to do it he must remember "just above a whisper."

THE CHOICE OF A TEACHER AND EXTRA STUDIO HELPS THERETO.

ALAN GRAY.

The choice of a teacher is a serious enough matter for the student, but unfortunately it is not properly realized by the majority of students until such time as the bitterness of experience has taught them that there are other things to be considered and of greater import than the teacher's reputation and the comparative cost of his instruction.

Vocal salvation by vicarious atonement of the teacher has never, perhaps, been promulgated as a doctrine of voice culture, but it must be admitted that something very much like it obtains in practice among the majority of students, and the weight alike of blame for failure or commendation for success is generally placed on the teacher's shoulders, while the part borne by the student is regarded as wholly negative, or, at best, passive.

It is true that the teacher has, or should have, much to do with the success of the student, but it is also true that his work in this respect is largely dependent on the ability of the pupil to understand that the value of many exercises which are given by us never lies in them as mere exercises, but rather in their efficacy as means to an end.

In these days there is no longer any necessity for the student to be at the mercy of any teacher what ever, for the basic principles of good singing are of the simplest nature, and have been spread abroad, both far and near, through the medium of musical magazines, lectures, pupils' recitals and the opera. And yet, in spite of all this, it must be admitted that in the selection of teachers the vocal student does exhibit a peculiarly sheep-like tendency to go astray, with the usual result in such cases that they often fall in with wolves. But the comparison is somewhat in favor of the sheep, perhaps, for, be the wolf never so well clad in sheep's clothing, as soon as the victim feels his fangs, he at least knows that he is hurt and bleats a protest, but the student will very often take an enormous amount of evil treatment and generally wait until his complaining is done for him by somebody else.

Now, to my mind, this comparative irresponsibility and sheep-like stupidity, unrelieved by bleating protest, exists in the voice student mainly by virtue of general ignorance, and the truth of this is all the more difficult of comprehension when we consider the musical magazines, pupils' recitals, opera and the enormous amount of singing, good and bad, with which the student is assailed on all hands.

How are we to understand this general ignorance in the face of so much well-calculated effort to alleviate it?

Take, for instance, the magazines. They are numerous, and many of them are almost entirely educational. All the difficulties that beset the path of the student are treated from every imaginable point of view; and these different view points are simply the outcome of the experience of the writers, who are generally teachers, and as such come in contact with all sorts and conditions of faults and virtues in the minds and voices of their pupils.

Now the result of all this experience has been written and re-written in hundreds of articles appearing monthly in as many magazines all over the country. These articles take every possible form, from a general consideration of the whole subject to a particular enumeration and explanation of every minutest nerve and muscle which may or may not have anything to do with the production of tone. Many articles are given out in the form of printed lessons, with simple and well-graduated exercises attached, each exercise being accompanied by copious and lucid explanations, to assist in its use and to prevent abuse, and couched in simple practical terms that any student may understand.

But some may object that among all this printed matter there is an immense amount of very bad stuff. I admit it, knowing it to be a fact, but in that very admission lies the proof of the comparative uselessness of the whole, both good and bad, as far as any practical benefit to the student-reader is concerned. The ultimate object of all this printed matter is, I take it, the education—intellectual and practical—of the student. Now, to get at the practical part, he must make practical use of what he reads, and such practical application will soon determine whether it be good or bad, and an average intelligence will not take long to very liberally cling to the good and eschew the evil.

So it is that a teacher may, with impunity, write exhaustively about all the secret knowledge he may have acquired in a long experience, knowing that no practical use will be made of it outside of a few rare instances; for if there were any chance of half the articles that are written accomplishing the object for which ostensibly they are printed, they would never be written, for the simple reason that half the writers could not afford to give out their knowledge in such a wholesale manner.

The truth of the above, if thoughtfully considered, makes one marvel at the feebleness of intellect or culpable carelessness prevalent among voice students, to which it points. Were it not so one of two things had surely come to pass long ere this: Either there would be no educational magazines, or, what is more likely, the occupation of many teachers would be gone and those remaining would be striking examples of the survival of the fittest.

There is another quality which the voice student has or is supposed to have, *i. e.*, the ear for musical sound. Its first importance is perhaps that of protection against false pitch. But it has another very important function, the efficacy of which is more directly the result of training or the lack of it, as the case may be, and this is the power to detect the false or true ring in the quality of tones produced correctly or incorrectly. Good teachers have this faculty highly developed and employ it constantly in teaching, as it enables them to detect faults of production or placing not perceptible in any other way. If at such times the student is attentive to notice the difference between the quality of tone which does not satisfy the teacher and that which does, this faculty has a chance to develop and progress and is greatly assisted thereby, for he becomes to some extent his own guide, knowing how his voice should feel and sound.

This faculty of the musical ear in discriminating between good and bad tone quality, coupled with that of intelligent observation, should assist the student in taking advantantage of another extra-studio source of general education, which certainly ought to help greatly in the matter of choosing a teacher—I mean pupils' recitals. Now the object of these recitals is, among other things, the exhibition by the teacher of actual results which he has obtained with different voices by his methods of teaching. But, here again, I find that the general ignorance or some more subtle defect of voice students, both actual and prospective, betrays them in a most woeful fashion.

I have attended some of these recitals, and it is but just to say that a number of them were thoroughly good and fully accomplished the object with which they were given; that is, that the public might judge by the work of the pupils, of the sterling quality of the teacher's capacity. But there were others which, as exhibitions of criminal incapacity and vicious maltreatment, were surely never excelled.

Now it would be an easy matter to understand and convincing proof of the efficacy of pupils' recitals as a factor in the general education of students, if after one criminal exhibition the name of the perpetrator should never again be heard as that of a teacher. Surely, that were a consummation devoutly to be wished and more or less agreeable to natural law.

But, unfortunately, such is not the case—the recitals occur regularly every season. The hall is filled with people whose ears are visible to the naked eye, and who, moreover, are supposed to be in possession of a certain amount of music sensibility, presupposing a normal capacity to suffer if exposed for any length of time to unmusical sounds; they are also endowed, theoretically, at least, with the attribute of commonsense. Among them, too, there is generally a certain number of prospective students. They sit for two hours or more while their ears are murderously assaulted, their artistic sense grievously outraged and their common-sense offensively insulted, in that they are asked to consider the originator of the recital as a teacher of voice culture and singing.

Well, and what is the result of all this to the teacher? Seventy-five per cent. of the prospective pupils become actual and the other twenty-five per cent. are only prevented from doing so because the teacher has no more available time.

Let it not be thought that the above is an exaggeration—it is simply the recital of an actual fact. I have, indeed, "Nothing extenuated nor aught set down in malice," and that such a thing can be true, not only in one, but in numerous instances, argues the deplorable condition, both intellectual and artistic, of a large number of voice students, and exhibits in a stronger light than ever that sheep like tendency to go astray.

I say nothing of teachers, because the success or non-success of teachers, good or bad, must ultimately rest with voice students as a class and their ability to discriminate between the two. To enable them to do this the intellectual level of students must be raised to a somewhat higher plane than it seems to occupy at present, and they must learn to make practical use of the many opportunities, which are staring them in the face all over the country, to acquire a general knowledge of the simple rudiments of voice culture.

For instance, if you hear of one teacher who advocates a stationary, depressed larynx in singing, and of another who insists that the larynx should rise all the time, then by simply putting two and two together you will arrive at this resut: *i. e.*, the larynx ought to be perfectly flexible and at liberty to rise and fall according to the natural demands of the voice.

Perfect freedom means perfect control, but this does not mean perfectly artificial control of artificial habits and effect, but it means knowledge of and coöperation with nature, and the initial and great difficulty of this

lies in letting nature alone at the start, that she may inform you with the knowledge by means of which you are enabled to coöperate with her intelligently.

In the following sentence: "There is but one way to relax, and that is—to relax," the writer has enclosed a simple principle of vital importance to the student. He means that the majority in the effort to relax simply stiffen and contract the more, unless they have a guide who is actually able to show them just what to do and impress them with the literal meaning of the fact that, unless nature is set loose, she never can be free.

OPERATIC ARIAS.

Ah fors 'e lui—La Traviata di Verdi.

W. LOWES-HEATH.

In a previous article I have already mentioned the advantage and increased facility in study, which results from a general knowledge of the character who sings the aria and a more or less particular knowledge of the scene which calls the aria forth.

For a general knowledge of Violetta, in "La Traviata," I refer the student to the story of "Camille," which most will have read or witnessed in the theatre. "La Traviata" is simply "Camille" set to music, the names of the characters are changed and the time is thrown back to about the year 1700 as a result of the demand in opera for picturesque costumes.

The particular scene which may be said to call forth the aria is the duet in the first act between Violetta and Alfredo, in which the latter has gently taken her to task for the evident carelessness and feverish desire for pleasure, with which she plunges into the vortex of dissipation, regardless alike of health or honor. He pleads with her that she will give him the right to watch over and care for her, telling her he has loved her for a year; and then, in a beautiful melody, which later finds an echo in the aria, he tells her of the day when first he saw her, and how since that time his heart has been filled with a great love which, at the same time, is a torture and delight.

Violetta doubts him, but tells him if what he has said be true he must flee from her, for she has nothing to offer but friendship, so he had better leave her and forget her. Still his words have touched her, and while forbidding him to speak to her again of love, as she bids him farewell, she gives him a flower telling him to return it to her when it shall be faded.

When later Violetta finds herself alone she thinks of the words she has just heard and begins to realize the sincerity with which they were spoken. To no other story of love has she ever given a thought, but now her heart begins to speak and she sees the possible dawn of a new life opening before her in which she loves and is beloved. These thoughts form the recitative:

"It is strange! strange! His voice still echoes in my heart! Would it then be a misfortune for me to love seriously? What sayest thou, O my troubled soul? The love of no man has ever yet touched my heart. Ah, joy that I never knew, to love and be beloved! And shall I disdain it for the follies and arid pleasures of my present life?"

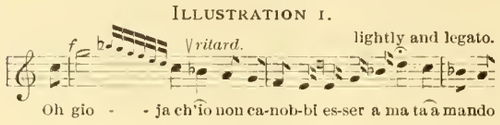
The first phrases, "E strano! e strano!" are taken piano and quite slow with a long, deliberate pause between. The accent of the word is well marked, and there is perplexity and surprise in the tone, the second phrase being sung with even more deliberation than the first.

The phrase, "In core scolpiti ho quegli accenti!" expresses the surprise of Violetta to find that her heart has been touched by the tones of a man's voice, calling on it, in the name of love, to which she thought she was dead. The phrase begins softly, but the time accelerates decidedly and the voice crescendos till it reaches forte on the E natural, working up to a climax on this note.

The following phrases, "Saria per me sventura, un serio amore?" are sung much more deliberately and at half voice. They are expressive of doubt that is almost trepidation, for Violetta feels that if she once yields her heart to love it will mean her whole life, and she will be defenceless in the hands of the man she loves.

The next phrase, "Che risolvi, O turbata anima mia?" is more agitated in time and tone, and the following, "Null 'uomo ancora t'accendeva," is taken naturally and easily as though she would reassure herself, but the thought engendered by this phrase gives expression to the next, "Oh gioia ch'io non conobbi, esser amata amando," in which, all at once, the realization comes over her that the joy of love is one she has never known, and her heart leaps at the thought that it may yet be in store for her.

ILLUSTRATION 1.

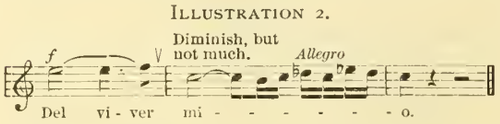


The voice rises forte to the G and the short run sweeps out with a rush. Breath is taken after the C, and the remainder of the phrase is well accented and sung deliberately, but the power is reduced and there is a quality of regret in the tone. In the next phrase the sixteenth notes are sung lightly but legato, and there is a yearning and tenderness in the tone which finds fuller expression in the hold on the D. See fig. 1.

The next phrase, "E sdegnarla poss 'io, per l'aride follie," are accelerated and given out with more power, expressive of the impatience and discontent with which she regards the false glitter of the pleasures she at present enjoys.

The first part of the next phrase, "Del viver mio," is taken full voice, well-sustained and very deliberately.

ILLUSTRATION 2.



The C is diminished and the sixteenth notes are sung very lightly, gracefully and quickly, the D flat and E flat being slightly accented.

Violetta has often found herself alone amid the crowd of pleasure-seekers surrounding her, and at such times she has thought of the fulness that love might bring into her life, and her mind has painted the picture of the man who should one day come, bearing the key that would unlock her heart to the joy of loving, and now as she thinks on Alfredo's words and remembers the ring of sincerity and love which they bore, the beautiful possibility seems almost near and her thoughts find expression in the aria.

"Ah, perhaps 'tis he whom my soul, when alone in the throng, so often has pictured in secret beauty. He, who, loving and tender, should pass the threshold of my life, to rekindle vital fever and awaken me to love.

"O love, thou breath and life of the universe—mysterious, superb; suffering and delight, torture and ecstacy of the heart!"

"In girlhood's days, a tender, trembling desire, this sweetest image reigned supreme o'er the future when, in the heavens, I saw the gleam of its beauty, and my very soul drew sustenance from this error divine, ah then did I feel that love is the breath of life of the universe," etc.

The student will readily appreciate that, in the study of this aria, much more is needed than the security of technique, although that is indeed necessary. But technique is a matter of the head which, sooner or later, becomes a habit of the voice, while the true interpretation of the aria demands that the singer enter into it heart and soul. The student should not be content to interpret the words as they may appeal to her at the moment, but should rather remember the strength and beauty of the character of Violetta, as it is later developed in all its power of loving and self-sacrifice and identify herself with the character as much as possible tor the time. In this way the value of the interpretation is doubled in that she appeals to the heart and not merely to the ear of those who hear her.

In the first phrase, "Ah fors 'è lui che l'anima," there is a good lesson in breath control in the first bar. The three rests must be well marked by holding the breath between the notes, and at the same time the notes must be sung smoothly, with no suspicion of jerkiness or staccato consequent on too quick an emission or stoppage of the breath. Violetta hesitates to believe in the near approach of a great joy, while

ILLUSTRATION 3

she already anticipates the pleasure of it, and all this is expressed in the first bar. The remainder of the phrase is sung in a sweet piano tone and very legato, while the eyes are smiling and tender, the word "lui" being softly accented.

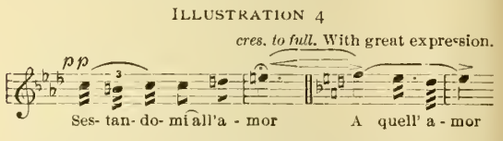
The portamento carries the voice over to the beginning of the second phrase, "Solinga ne' tumulti!" The first three notes are accented but sung perfectly even, the F is expanded and the grace notes in the following measure are sung very lightly. The portamento from the C is carried up piano to the A flat. In the next phrase, which repeats the same words, the three sixteenth notes are well marked but even, and the two eighth notes on C expand slightly, with a touch of sadness in the quality.

The ideas for the next three phrases are much the same as for the above three. Care must be taken in all accents and expanding that the legato be preserved and the piano tone sustained throughout.

The phrase, "Lui che modesto e vigile," commences pianissimo, but the voice fills out slightly towards the close and the time accelerates decidedly. The following, "All 'egre soglia ascese," the voice crescendos more fully, the time still accelerating, and the next, "E nuova febbre accese," is sung forte and quite broadly.

In the phrase, "Destandom all 'amor," the voice drops at once to a pianissimo tone, white and sweet and right on the lips, which are smiling and tender at the thought expressed. The time also ritards in preparation for the breadth of the next movement. The E natural is held and, crescendoing from piano to full forte, is carried up by portamento and the next phrase begun on the same breath.

ILLUSTRATION 4



This phrase, "A quell 'amor, quell 'amor che e palpito," must be sung with all the breadth and power that the singer can put into it. Forte hardly expresses what is needed in this phrase, it is rather a full-bodied expansion of the voice which must be sustained evenly through the phrase, which is sung legato and very broadly, the F and E being accented.

The next phrase, "Dell 'universo, dell 'universo intero," is sung in the same manner, saving that the sixteenth notes of the triplets are accented.

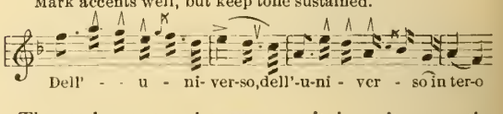
In the phrase, "Misterioso," the eighth notes are accented but the voice is reduced almost to piano, and in the next the four sixteenths are accented, and in the portamento, from C to F, the voice crescendos. The legato must be preserved in these phrases.

ILLUSTRATION 5.

In the following phrase, "Croce, croce, e delizia," the A is attacked forte, but the following triplet of sixteenths is accelerated and sung very lightly, the eighth note on D being slightly accented. The same note is accented in the next phrase and the final phrase may be adorned with a turn between the A and B flat, the latter note being held.

The next verse it is not necessary to phrase, as it is precisely similar to the one just treated, and the literal translation of the words will be found sufficient guide for the local coloring. In the second phrase of the second part, "Dell 'universo," there is an alteration from the printed score which is given in the illustration below.

ILLUSTRATION 6.



The cadenza can be sung as it is written or the student can avail herself of a printed work, compiled by Madame Marchese, containing a splendid collection of cadenzas, which has been lately introduced into this country.

REFLECTIONS.

JOHN H. GUTTERSON.

The calling of a clergyman to fill a pulpit is not nearly so difficult a task as is the filling of the opposite alcove—organist and choir. January, February and March then are the shivering months for the latter combination, particularly, as is the case in a certain church well known to the writer, where all four singers are dismissed at the termination of their year's engagement, and no one need apply who has *ever previously* sung in that church!

As is but natural, the better class of singers are beginning to boycott the place, knowing well that it is *variety*, not good *church work* that is desired. But I did not begin this article with any idea of abusing the tactics of *any* church. What I want is the attention of church-singers and singing-teachers, and I am speaking, as many readers of this paper know, from the standpoint of an organist and choir director.

Numbers of young people come to me "to sing for me as some time I might," etc. If I am honest, to some I must reply, "*Never!* while you are so faulty both in *interpretation* and *diction!*"

"Diction?" What is that!

Now I want the ear of the voice teacher. Something is wrong with your work, the crop of young singers is not so good, on an average, as that of years past. Too much *method* and *too little thought conception.*

"Hark! Hark My Soul," sang one girl the other day with precisely the same interpretation that she used afterward in "Save me O God,"—the one a song of spiritual satisfaction, the other a despairing cry for help.

"The Hope I Dreamed of was a Dream," shouted a youth with as much gusto as he employed in the Bandèlaro. Who is to blame!

"Put some *tears* into your voice!" said the late Mrs. J. H. Long to a pupil who was tryingly wading through Pinsuti's "Land of Rest." The poor girl wept at the reproof, thereby getting the tears into her voice and also a never-to-be-forgotten lesson.

This same Mrs. Long, called by some America's greatest ballad singer, would sing "Charlie MaCree" with such persuasiveness that it was no wonder that Charlie, like Leander, swam the Hellespont. Her Mary of Argyle was as soft as wool and as tender as a lullaby, and yet, when in the then famous old Boston Music Hall she sang for the Handel and Haydn Society, "I know that my Redeemer liveth," she gave you electric shocks, and thrilled you with the conviction of the immortality of the soul, as no sermon ever could do. Perhaps the secret of such power in song lay in the reply she used to make when asked as to her "method." "Breathe as God Almighty made you and open your mouth and sing!"

Do not think that in any way I would undervalue *technic*—not indeed, while I work for it at the pianoforte as I do—but oh, for the little indescribable something in singers, temperament—anything you have a mind to call it—I care *not*, if it is only *there.*

These young people have good voices, and I am well aware that they, like myself, must begin! They sing a good solo—just as you have taught them, but put them to an anthem and where are they? Rhythm and attack are wanting, and the words are sung like the columns of a spelling book!

Many teachers, I know, are holding sight-reading classes for their vocal pupils. That, of course, is a good plan. Some teachers who have chorus-choirs to direct, allow certain pupils to sing in return for lessons. This is better for the student, than for the cause of music, beside cheapening the price for the more experienced church singer.

Recently a young lady sang for me as a supply in church. She demurred at the modest sum I was able to pay, sang her solo fairly well, but turned pale at the Doxology. She had actually never seen the Old Hundredth Psalm!

This is a sample of many cases, well known to me, which can be cited, and of which I have often spoken to my voice teaching friends. One teacher replied—"*I* am a *voice-builder*, sight reading belongs to someone else!" A short sighted view of the case, for we at the pianoforte expect to teach *reading* as well as *tonality.* I wish from my heart that the old fashioned singing school was in vogue now. Before my voice changed I went to one, singing alto with the basses behind me, and gaining a knowledge of the relation of the different parts, as I listened, and sang. Later I joined the basses in almost the last singing school of which I know anything about. We read by note, sang glees and rounds, opera choruses, and such things as "Jehovah's Praise," "Strike the Cymbal," and the then popular works of C. A. White, and to this day I can remember with what mild excitement I waited the "leads" in some of those old stand-bys.

My Sunday night work is with a chorus of sixteen, a few miles out of Boston. At the rehearsal we stand in a circle, the conductor in the center (we have a pianist, who also plays the organ at the church service) helping, with what John Francis Gilder told me recently was easily recognized as a "pianist's voice." As the voices blend around me, and I watch for discord, I feel to be thankful for my birth in a country town which afforded me the now almost *obsolete advantages* of a *singing school!*

FLOTSAM.

M. Jean de Reske and Fraulein Ternina have made a great success in New York in "Tristan and Isolde." The *Musical Courier* has a striking criticism of Ternina's Isolde. "Ternina belongs to the Neo school of Wagnerian interpreters. She lacks the large, emotional sweep and intellectual vision of Lilli Lehmann; nor has she so remarkable a voice. But her keen analysis, sometimes merciless analysis of Wagner's phrases, musical and poetic, give as a resultant an extremely finished characterization. Her brain rules her work, and she seldom lets her emotions sway it. On the other hand this Bohemiam woman's acting is so varied, so skilful, so inevitable, that Isolde stands before us almost a new creation. The general emotional key was rather low than high pitched. In the first act the imperious Irish princess is not so set before us as the loving woman. But in the garden scene, with all its musical enchantments, Ternina's acting and singing were very lovely. And she sung in tune; sang those close and difficult intervals with absolute purity of intonation. Her 'Liebestod' was subdued by grief, the grief of a shattered heart and brain. It was without the triumphant dramatic climax we expect, yet none the less it was absolutely sincere." Personally, I think that triumphant dramatic climax is always overdone. The Death Song is really a heart-broken thinking aloud.

A writer in the *Referee* has inspected the programs of the State concerts from 1837 to 1860 "The first program is dated Kensington Palace, '5 Guigno, 1837.' It contains fifteen items, six of which are by Costa (who was the accompanist); the remainder are operatic excerpts by Rossini, Mercadante, Donizetti, Cimarosa and other Italian composers. The singers were Mmes. Grisi, Assandri, Albertazzi; M. Ivanoff and Signori Rubini, Tamburini and Lablache, the last-named being the late Queen's singing master. Every piece was sung in Italian, and the entire scheme shows the domination of that country's music in England at that period. The next concert did not take place until June 12, 1840, two days after the Queen had been shot at by Edward Oxford. In the interim events had marched quickly, the coronation had taken place (June 30, 1838) and the Queen had been married (February 10, 1840). * * * The program contains significant changes. Italy no longer reigns supreme, Mozart is admitted twice, and Haydn once (there can be little doubt at the instigation of Prince Albert), and several English ladies take part in the performance, notably Lady Sandwich who sang with Signor Rubini a duet from Rossini's opera, 'William Tell.' This concert, which took place at Buckingham Palace, is the last in which the Queen took active part."

Some years ago, a singer whose voice was eccentric and escaped all the classifications for ordinary roles, summoned up courage and presented himself one day to Cherubini, hoping this master would be able, after hearing his voice, to advise him how best to make use of the powerful tones he could bring forth from his vocal organs. The gruff Cherubini received him. "Place yourself at the piano," said he. The singer, delighted with this reception by the illustrious maestro, did not wait for a second invitation; he seated himself and struck out with all the liberty of his robust lungs in a manner to lift the roof. After a time, turning to Cherubini, he said: "Have you heard?" "Certainly," responded the master. "And now! illustrious maestro, in what role can I best use my voice?" "In that of an auctioneer," returned Cherubini.

"DRAW NEAR THE GOD-HEAD."

FRANK H. TUBBS.

It would seem as if those who had become great musicians were the ones to give advice to music students and teachers. Few musicians have said things of worth. Schumann, Wagner, Beethoven and a few more gave good help, but what do one dozen signify when we think of the thousands of great musicians of the last two hundred years? Or is it that we are so taken up with to-day and to-morrow that we cannot look at yesterday? But we do well to learn from the experience of the past.

Beethoven's remark, "Nothing can be more sublime than to draw nearer to the God-head than other men, and to diffuse here on earth these God-like rays among mortals," has seed-thought. While that would serve as text, that in mind would lead far afield, so we will use—take it as a text. Instead, let us call to mind how true was Beethoven to his own idea. He is, as Paderewski says, "the most soul-satisfying of composers for the piano." He is soul-satisfying for the voice, too. Many don't think that, but it is because they have not been near enough to Beethoven. The soul satisfaction is there. In what way did he draw near to God-head and can you and I do likewise? There comes the word "genius." Did he have it and we have it not? On that point we may differ. A special aptitude may have been his for composition. That was his form of genius. He thought; he knew how to express; he expressed. Cannot you do the same? I believe that he who learns to draw from the God-head and will work as did Beethoven, has the genius of a Beethoven. It may not demonstrate in exactly his way, but in some manner equally good, and the demonstration comes as the result of "drawing nearer the God-head."

In all my study of the masters I find none who thought himself a genius. Possibly Spohr is the exception which proves the rule. In most cases—remember Schubert and Mozart—no one else discovered the genius until long after they were gone. Do you suppose that those men would have been left to struggle as they did had anyone seen their great genius? Well, how do you know but that you possess just as great genius? If you have it, "draw near the God-head," as did Beethoven. It is in that appreciation of Divine truths that genius best grows.

We singers, we forget the need of musicianship. We cultivate physical gifts and use gift and culture as best we can. There is no genius in that and it does not require intellectual ability to do that. At least, no such intellect as it does to be a Beethoven. It is, however, about where singers finish. If you have genius it is not to be manifested in the voice merely. The realm of music is to be covered and in that will the genius find opportunity. How narrow we are! A lady declined to study oratorio arias because she could not sing them for people. She knew nothing of reaching through music into the God-head. She will never be an artist. Why, what do you think Jean de Reske studied much last Winter? Comic songs! Think of the great "Lohengrin" and "Tristan" singing hour after hour on comic songs! He did so, and for a purpose. The study of humor in music and American life gave him a new field for research. That develops a side of his musical nature—call it genius, if you like—which he knew should be developed. Are you doing as much? Perhaps you do not need comic songs but you need something. You should know what it is and work at it. In whatever form it may be it will help you in music. There is no branch of music which is barren. There is enough in music to make a full life for every one of us. If you do not know *your* bent, the direction of your genius, how can you use your specialty for drawing from the God-head, go to a teacher and find out. You need to know. If you can be with that teacher long enough to let him learn your inmost nature, he can the better tell you what your specialty is and how you may best use it for your good. When you have received, then give. Withhold nothing from the musical world. In giving you prepare to receive more. That which you give will be "God-like rays," and the world needs them. Rays of pure music; soul-satisfying music. You may have the means in your music to be worthy the immortal crown which Mozart, Schubert and Beethoven wear. This wonderful time through which the country is now passing, should produce great men and women in music. They are sharpening the wits of all peoples and music will get the benefit of it. You may be the bright star.

THE ORGAN.

Organ Study.

In this issue is given the twelfth of a series of articles on Organ Study, by an organist of long experience both as a teacher, church and concert organist. This instalment answers various queries evoked by previous topics It is the purpose of the articles to give practical suggestions so complete and comprehensive that they will aid students of "The King of Instruments" to acquire a mastery over its complications and inexhaustible resources. It is particularly hoped that all who are interested in this subject will send to the editor any questions that they would like to have answered. Due notice will be taken of all that are so sent.—Editor of THE MUSICIAN.

XII.—THE SWELL SECTION.

WM. HORATIO CLARKE.

The Swell Box is an artificial device for producing the effects of crescendo and diminuendo with all the stops of Section II. It is called *artificial* as compared with the natural methods employed in other instruments. With the pianoforte the expression is produced by the direct touch upon the keys. With stringed instruments, played with a bow the impulse given to the bow in its direct action upon the vibrating string modulates the expressive force. With the cornet, and other brass instruments, the force is graduated by means of a more intense contraction of the embouchure and greater lung power. With the clarinet and saxophone the lips press more firmly upon the reed as the lung force is increased. With the flute the power is controlled by the breath of the lungs. In all these instruments the expression is *naturally* produced by modifying the intensity of the vibrations in the direct application of the thoughts to the musical utterance.

This is not the case with an organ pipe. Whatever means are employed there is no change in the speech of the pipe in pressure, power or quality. Its tone keeps at an even power at all times. Thus, in the grades of expression with all the pipes of an organ there is no real change of power, but the dynamic effect with certain stops is produced by enclosing all the pipes of the Swell Section in a compartment called the Swell Box, the front side of this compartment having movable shutters. These shutters are called "folds" or "shades." When they are closed the effect of the sound is diminished to the listener, and a crescendo effect is obtained when the folds are gradually opened, the actual power of the pipe always being the same inside the box, so that in no case can the expression be produced from the vibrating pipe direct by the player.

In order to subdue the power of the sound as it reaches the ear, without diminishing the tone of the pipes in their speech, the sides, back and top of this box are made of two thicknesses of material, with a space between, which is often filled with sawdust or other non-sound-conducting substance. The front is generally formed of a double framework in which are placed two sets of interior and exterior folds, which are opened and closed, to give the effect of crescendo and diminuendo. Some builders use three sets of folds, but this is not necessary if the folds are well-fitted and the box of good thickness. Even one set of well-fitted folds of double thickness of material have proved as effective.

When a lever is used to actuate the folds they are placed horizontally, like Venetian shutters, but when moved by a balanced pedal they are arranged vertically When horizontal they are weighted and close by gravitation when the foot is released from the pedal. This pedal has a ratcheted adjustable attachment for holding the folds open at different degrees. When vertical the folds remain in any desired position. The balanced pedal is shaped like the sole of a shoe and the folds are opened by pressing downward with the heel.

The swell box fits over all the pipes of the Swell Section. It is entered by means of a door, or double door, and there is ample space, with walking boards, to reach all the pipes in tuning. The height inside depends upon the capacity of the instrument. If the 8 ft. open stops run through it is generally nine feet high. When there is a 16 ft. reed stop, the pipes of the lowest octave are mitred after the principle of coiling up the actual length of a cornet or other brass instruments.

There is quite a difference in the effectiveness of the Swell Section with different organs, owing to the efficiency or deficiency in subduing the sound. Where a wall has been used as the back it has proved a failure, which has afterwards been remedied by putting a back in.

It is not well to line the inside of the box with any substance which will absorb the tone, as it will destroy the resonant effect required to reflect the sound when the folds are open.

The actual force of the crescendo takes place in the first inch of opening the folds, and the leverage for opening them should be so adjusted that in the use of the pedal the motion should be so divided that the crescendo should be produced by a gradual pressure of the foot instead of the sudden sforzando when the toe is first pressed. A number of years ago one of the valued MUSICIAN contributors, Mr. Herve D. Wilkins, of Rochester, N. Y., invented and applied such an arrangement to the organ where he was playing.

In many recent organs the Choir Section is also enclosed in a separate swell box, the folds of which are operated by another pedal. Some builders also enclose the shrill and harsher stops of the Great Section in the box of the Swell Section, including the Super Octave, Mutation and Compound ranks of pipes as well as the reeds. This brings the fundamental stops into greater effectiveness in the full organ when the swell is closed, thus subduing much of the disagreeable quality, and adds more noise to the crescendo when it is desired.

Following are the names of stops as found in the Swell Sections of English and American instruments:

16 ft. Double Open Diapason.
16 ft. Tenoroon Diapason.
16 ft Contra Gamba.
16 ft. Double Dulciana.
16 ft. Bourdon.
8 ft. Open Diapason.
8 ft. Violin Diapason.
8 ft. Viola.
8 ft. Viol di Gamba.
8 ft. Viol d'Orchestré.
8 ft. Oboe Gamba.
8 ft. Viol d'Amour.
8 ft. Keraulophon.
8 ft. Æoline.
8 ft. Dulciana.
8 ft. Vox Celestis.
8 ft. Vox Angelica.
8 ft. Philomela.
8 ft. St. Diapason.
8 ft Gedackt.
8 ft. Quintadena.
8 tt Quintation.
8 ft. Hohl Flöte.
8 ft. Concert Flute.
4 ft. Principal.
4 ft. Octave.
4 ft. Gemshorn.
4 ft. Violina.
4 ft. Salicet.
4 ft. Gambette.
4 ft Harmonic Flute.
4 ft. Traverse Flute.
4 ft. Rohr Flöte.
4 ft. Flute Octaviante.
4 ft. Nighthorn.
4 ft. Suabe Flute.
2⅔ ft. Twelfth.
2⅔ ft. Gemshorn Quint.
2 ft. Flautino.
2 ft. Flageolet.
2 ft. Fifteenth.
2 ft. Harmonic Piccolo.
1 ft. Fife.
3 or 4 rank Mixture.
3 or 4 rank Cymbel.
3 or 4 rank Acuta.
3 or 4 rank Sharp Mixture.
3 or 4 rank Dolce Cornet.
3 or 4 rank Echo Cornet.
3 or 4 rank Furniture.
16 ft. Trombone.
16 ft. Contra Bassoon.
16 ft. Double Trumpet.
16 ft. Euphone.
8 ft. Horn.
8 ft. Trumpet.
8 ft. Cornopæan.
8 ft. Oboe.
8 ft. Corno Dolce.
8 ft. Corno di Bassetto.
8 ft. Clarinet.
8 ft. Vox Humana.
8 ft. Physharmonica.
4 ft. Clarion.

IMPROVED SWELL MOVEMENT.

Modern organists have been earnestly looking for some device in actuating the Swell folds which would give constant freedom to the right foot when the swell was being used in giving expression. Reference was made to this in Art. IX, concerning a rest which may be slightly pressed by the back. This idea is not new, as it was first advocated by Mr. N. S. Heineken, of London, in 1851. But organ improvements are of slow growth and it was not then acted upon Yet, to prove that the matter was being agitated, in 1881, at a conference of the London College of Organists to determine upon an English standard for all the relationships of manuals and pedals, position of stop-knobs, position and order of composition pedals, etc., it was recommended that some method be devised to operate the swell by means independent of the swell pedal, and also that some plan would be designed to improve the crescendo. Thus, this important subject has been under consideration for half a century, and a lesson of patience may be taught those advanced organists who are advocating the discontinuance of the use of dissonant and antagonistic mixtures and substituting for them more fundamental stops. which include the partial harmonic tones, when it is known that the Abbé Vogler, celebrated in Browning's musical poem, in his system of organ building more than one hundred years ago, advised the abolition of mutation and compound registers, which he argued, were unscientific and unmusical.

In addition to the back pressure device, a number of methods of operating the swell have been suggested, and among them was one in which a rod was to be extended in front of the swell keys so that the wrists would rest on it and press down for opening the swell folds, which were to be actuated by pneumatic action. Another way was to have the swell key frame fulcrumed, so that on pressing the keys the swell folds would be opened and in relieving the pressure they would be closed.

One of the most practical methods of operating the swell folds would be by means of a flexible rubber tube with a mouthpiece, like that of a flageolet, of ivory or hard rubber. This would be held in the mouth by the teeth and the swell folds opened by gently breathing into it and held open by closing the orifice with the tongue and the folds would be closed by letting the air escape. The air breathed into this cloth tubing would enter a pneumatic bellows which, in dilating and contracting, would operate the swell leverage. It would only be essential that each organist should carry with him his own mouthpiece. This would be as natural and refined as playing a flute, oboe, clarinet or any wind instrument, and there would be no more effort of the lungs than in playing a flageolet; neither would the tube be in the way, as it would pass down at the side, between the arm and the body. This arrangement is so simple that it could be applied to any organ now in use.

GRAND CRESCENDO MOVEMENT.

This is a device applied to large organs for bringing on in successive order in its grade of power with the proportionate balance of the pedal basses, from the softest stop to the full organ, and then reversing the process, from the full organ to the softest stop, without disturbing any combination which the organist may desire to have set, but if the crescendo starts with the softest stop there must be no other stop drawn. There is a dial indicator over the keyboard which tells the number of stops which are on as the hand points in revolving.

As the different stops are brought on, the knobs do not show any indication, because pneumatic stop action is required with this mechanism. It was first operated by a long, sliding, narrow foot-bar, placed just above the pedal sharps, moving from left to right, and, vice versa, by the toe, there being cleats placed on the bar at intervals for this purpose.

The movement is also operated by means of two pedals in the centre over the pedal clavier, both accomplishing the same reault by a ratchet device. Working the right pedal brings on the crescendo and the left pedal takes off the stops.

Another method is by means of a balance shoe-pedal which, on pressing at the toe, starts a rotary pneumatic motor which brings on all the stops in their dynamic graduation. The motor is reversed in its motion by pressure at the heel and the stops thus taken off.

Where an organ has this attachment care must always be taken in making combinations with the stop-knobs to see that the crescendo indicator hand points to zero, for if any stops should be on by means of the crescendo pedal not having removed them all, no softer combinations could be made until the hand should point to zero.

ANSWERS TO QUESTIONS.

AN ISOLATED STUDENT.

D. W. P.—"Can you give me any advice in regard to further progress in playing? I am 25 years of age and am employed in a country store day and evening. I have a good cabinet organ and have taught myself to play hymns slowly, but cannot execute rapidly as my fingers are very stiff. Am I too old to practice so

as to render them more flexible? I can only get an hour a day early in the morning. Will that be sufficient? I am a member of the choir of our little church and we have a reed organ for accompaniment. We are in a village far from any large town, and find it so difficult to procure a player, that I am cherishing the idea that by means of the proper instruction books, I may be able to play the accompaniments. I will appreciate any help you may be willing to give."

Answer.—You have doubtless not had any exercises for strengthening and rendering the fingers flexible. The nature of your business requires heavy lifting, possibly, which tends to stiffen the muscles of your hands. But even with your limited time, you are not too old to make good improvement if you will daily practice the scales and finger exercises in the systematic order found in any standard reed organ instruction book, which you may obtain of the publishers of THE MUSICIAN. The finger exercises found in "Plaidy's Studies," will be helpful also, as well as those found in Book I of the National Graded Course for the Piano.

Practice the scales in all the keys until you can play them rapidly from memory without looking at your hands. Send for books of easy voluntaries and a field of good music will open to you, and you will soon be able to execute the hymns and choir anthems without further trouble.

Divided Stops.

E. G. H.—"I play an old two manual organ which has many of the stops divided into treble and bass. As I never use any of them separately, can you tell me what advantage there is in this division?"

Answer.—There is no advantage in the use of divided stops, and they are not found in first-class modern organs. They were introduced in the days when many of the stops were of short range, ending generally on tenor F, with one bass serving for several stops to save expense. Then the custom was elaborated so as to make an exhibition of a greater number of stop-knobs as representative of greater musical capacity than the instrument contained, a species of commercial practice neither artistic nor honest. Where the Swell 16 ft. Bourdon is divided into treble and bass, so as to furnish a soft sub-bass to the Salicional and Æoline, modern builders use what is called a "split" knob, or knob which is halved so that but one knob is used for both the treble and bass.

Connecting a Reed and Pipe Organ.

B. C.—"I have a two manual reed organ and a small pipe organ in the same room. Is there any way of connecting them by electricity so that when I play the reed organ the pipe-organ keys will also be drawn down?"

Answer.—Yes, if you can afford to pay out double the value of both instruments, or from three to five hundred dollars, with the clear understanding beforehand that the result would be a musical failure, as the reeds of one instrument would seldom be in tune with the pipes of the other. The combination of the common free reeds with organ pipes has never been successful. There are only certain temperatures when the two would be in tune. It would be more practical when you want to play them together, to have a congenial friend play the other instrument, and if you are a composer, you could arrange pieces for both instruments with more variety, at the times when they would be in tune with each other.

The Pitch of Church Organs.

J. W. T.—"At what pitch should a pipe organ be tuned? I have read that the pitch was much lower a century ago than at present. This may account for the old masses and oratorios having been written so high on the staff for the vocal parts. With many of the choruses in them, I am obliged to transpose the accompaniments a diatonic note lower than written so that the voices will sing the upper notes correctly."

Answer.—The pitch should depend somewhat upon the service. If an orchestra is used with the organ, the pitch must be graded so as to be in tune with the wind instruments, especially the orchestral Oboe to which the other instruments are tuned.

A century ago and more, there was no adopted standard of pitch among the musicians of various countries. In the time of Handel there were two pitches in use—Church and Concert—and the former was a whole tone higher than the latter. In the time of Purcell there is evidence of two distinct pitches, and the pitches varied in the other European countries. Even within a half century, the pitch of some of the tuning forks marked C, in use in German public schools, were two diatonic notes lower than the present pitch.

The modern Philharmonic or International Concert Pitch has generally been adopted as a standard, which is lower than the pitch of twenty years ago. A yet lower pitch is being advocated as one universal pitch which is meeting the approval of English organists and choirmasters.

When the large German organ was finished in the old Boston Music Hall in 1863, it was voiced and tuned at the then French low pitch, with the result that the prevailing pitch of the orchestral wind instruments did not coincide. To obviate this discrepancy, a special set of wind instruments were made for the players to use when oratorios were performed. These new instruments proving to be of imperfect intonation, it was decided to raise the pitch of the organ by cutting off all the open flue pipes, a work which occupied several months.

The lowering of the pitch of a large organ would be quite expensive, because each pipe would have to be moved upward and set a chromatic degree higher, and a new pipe inserted for the lowest note. With such an organ as that in Albert Hall, London, which has the record of having the highest pitch of any known concert organ, such a change of pitch would involve a large outlay of labor. A marked change of pitch after an organ is finished also modifies the original character of the voicing.

A low pitch is very advantageous for chorus choirs and congregational singing. With the latter, the voices are not always in tune where the tones are above fourth line D, and this fact should be considered in the selection of the tunes to be sung.

Those who have been opposed to a lower pitch are gradually favoring it for church purposes. At a recent meeting of the Musician's Conference in London, it was unanimously resolved, "That it be a recommendation to the general council that they consider the question and take such action as they deem desirable," concerning the proposal for a standard low pitch for church instruments.

Depth of Small Organ.

T. M.—"We are thinking of having a small pipe organ built for our chapel, to be placed on the platform back of the desk. The platform is two feet high. Could we save any space in depth by having the bellows let down as low as the main floor?

Answer.—You would not save anything in depth by placing the bellows as you suggest. A small organ should always be built so that it can be removed and used elsewhere, and the lowering of the bellows would be detrimental to this object. It would be better to give the instrument its requisite depth and bring the platform and desk a foot or more out into the room. Church officers are sometimes too unyielding about the space surrounding a pulpit.

An instance comes to mind of a six thousand dollar organ which was built to be placed in the rear of the moveable pulpit. In order to build the instrument properly, the builder was obliged to use a foot more depth than was specified. On this account the committee were so finical, that when it was finished they refused to accept the improved instrument unless the builder should arrange the interior musical and mechanical work so as to cut off the needed twelve inches, to actual detriment of the instrument. They were so unyielding that the organ had to be rebuilt to meet their whims at a loss of a thousand dollars to the builder. And this foot of space was in a church edifice which has never been filled, and where there is ample room.

Triangular Wood Pipes.

A. E. D.—"Of what advantage are triangular wood pipes as compared with square pipes?"

Answer.—The results obtained from triangular pipes are not worth the extra trouble of making, as they have no superiority in tone quality, and are more difficult to voice. Better effects may be produced from small scale rectangular pipes.

Organs with Two Separate Consoles.

A. W.—"Are large organs ever made with two separate sets of keys and pedals so that two players may execute the music at the same time?"

Answer.—Yes, and it is a very commendable idea. The large organ in the Cathedral of Riga in Russia, has two separate sets of claviers, one played from an upper gallery and the other from below.

When electro-pneumatic action is employed, as with the most modern large organs, it would be a very practical method of increasing an interest in organ music, because in composing for two players it would open a wide field for registration effects unattainable in any other way. Each manuscript arrangement would have its own subjects with distinct registration, so that polyphonic music could be interpreted with an individuality of parts impossible to be accomplished by a single player.

An Unfortunate Location.

J. L.—"The organ I play has the keyboards arranged under a high projecting corbel which prevents my hearing the power of the instrument as it sounds to others, and is very detrimental to the satisfactory accompanying of the choir of which I am the director. If I play with sufficient power for me to hear the combinations, the voices are covered by the organ tone to all who are in the church. It not only makes it laborious in drilling the choir at rehearsals, but destroys all my inspiration, because a very fine instrument as it resounds in the church has so tame an effect at the keyboard, especially when I am surrounded with the singers whose voices are so near my ears. Is there any device like a telephone reflector which can be adjusted to my ears so that I can get some idea of the tone as it sounds to others more remote?"

Answer.—You are certainly located in a very unfortunate position for an organist and choirmaster. There is no method of reflecting or conveying the sound to your ears. The only way of obviating this defect, is to go to the expense of introducing electro-pneumatic, or tubular pneumatic action so that the keyboards may be brought out from the case, either in front of your choir or at one side. If this cannot be done, the next best thing is to have one of your most accomplished pupils at the keyboards during your rehearsals, drawing the stops which you indicate while you stand in front of your choir in drilling them, and then occasionally place yourself in various positions of the audience room so that you can hear the effects and form your judgment accordingly.

If your singers hear the organ tones distinctly, it is not so bad as it might be, for in some cases the organ belt has been placed so high up as to act as a shield. To allude to this defect from personal experience, permit me to say that I once held a position as organist with a large four manual organ where an expensive quartet was employed. The belt was so high above the keyboards that the singers could only catch the organ tones as they were reflected back from the opposite end of the auditorium, and the only solution of how to blend the organ with the voices was in placing them at the desk with the minister, where there could be no communication between the choir and organist during the services.

The Size of a Pipe Organ.

J. T. I.—"Is the size of an organ determined by the number of the draw-stop-heads which include divided stops and couplers, or by the number of slides?"

Answer.—The capacity of an instrument is measured by the number of complete speaking stops, and does not include any mechanical stops. Compound stops with several ranks of pipes are only counted as one stop. This may be illustrated by the largest organ thus far built, which is in the Town Hall in Sidney, Australia, with its five manuals and pedal clavier. There are 140 solid ivory draw-stop knobs, 64 on the left and 76 on the right of the manuals, with 33 pneumatic combination piston knobs between the keyboards, and 13 composition pedals. There are 126 actual speaking stops, which determine the musical size of the instrument.

Pedal Pneumatic Action.

T. P. M.—"I wish to have tubular pneumatic action put in an organ from the pedals to the pedal windchests which stand on each side of the instrument. Can you advise me how this may be done?"

Answer.—It would require more space than can be given in these columns to illustrate how this may be done, and as the work will have to be put in by a practical builder, it would be well for you to communicate direct with some responsible organ builder who will furnish you a sketch and give an estimate of the cost.

Thumping Pedal Piano.

C. M.—"The organ pedals attached to my piano make such a thumping noise when I practice, that the occupants of the room underneath complain of the disturbance. I have put felt bearings at the corners without obviating the noise. Can you suggest anything further? The knowledge that my evening practicing is disagreeable to others puts a damper on my enthusiasm."

Answer.—One of the first principles of musical study should be to cultivate a regard for the feelings of others. Cut out of an old rubber mat four pieces for

your piano castors to stand on. Then fit a half inch rubber tube along the thumper rail for the pedals to strike on, and let the pedals also rest upon another piece of this rubber tube. This will doubtless allay the thumping disturbance. To further prevent annoyance, if your piano has not a mute stop, fit in a strip of wood with a strip of felt glued to it and place it so that the felt will hang between the hammers and the strings. This will soften the sound, and the strip may be taken out at any time.

Organ Piano.

J. M. K.—"A few years ago I read of an attachment to a piano which gave it a sustained tone by means of small hammers, which were kept in rapid vibration by means of a revolving fly-wheel actuated by a pedal. When the key was touched the string gave a continuous note. If such an instrument is anywhere to be obtained, would it not be excellent for organ practice with pedals attached, as then the bass notes would be prolonged—the movement to be actuated by some kind of a motor?"

Answer.—I have only seen one instrument of this kind, and it has not become an article of trade in this country. There was a more effective instrument invented in Paris more than twenty-five years ago. If you will open your piano and attach one end of a fine string to one of the wires of middle C at about the point where the hammer strikes, and well cover the ends of your thumb and first finger with powdered violin rosin—and on opening the sostenuto pedal, draw your thumb and finger along the attached string, a vibration will be communicated to the piano string which will give forth a tone similar to the violoncello. This is the principle of the French violin piano, or the Quartour piano, as it is called. There is a small cylinder placed in front of the strings which is revolved so as to produce a continuous tone. This cylinder is coated with a resinous substance, and when a key is pressed, several strands of horse hair connected with the piano string are brought into contact with the revolving cylinder, and the piano string gives forth a continuous sound as long as the key is held. This makes it possible to execute organ music in sustained tones upon a pianoforte. This instrument attracted much attention from musicians at the time of its invention and much was expected from it. I have a description of it from the inventor, but it has disappeared from publicity, and cannot now be found in Paris.

It will not be long before the pianoforte string will be so actuated in vibration by an electrical armament of such rapidity that a continuous tone will be produced without any apparent iteration of the means of actuating the vibrations. Then there will be a simple and satisfactory instrument provided for organ practice at the least expense.

Attaching Pedals to a Piano.

A. F. W.—"Could a set of organ pedals be attached to a piano by using catgut cords running over small pulleys so as to pull down the piano keys?"

Answer.—Such an arrangement has often been done, but it is always unsatisfactory, for the reason that the cords stretch and change with the weather so that at times certain keys will not be pulled down enough to sound. There would have to be two sets of pulleys, and the cords would run diagonally to the left with the upper pedal notes.

The roller action is always sure, firm and durable. The rollers can be made of ¼-inch gas pipe plugged with wood at each end for a steel wire center. Metal arms can be screwed into the rollers at the proper places. A tracker from the pedal pulls down an arm on the front side of the roller, and the arm on the other side pushes a sticker up against the under side of the manual key lever the farthest from the player.

Another firm mode of attachment is used by introducing a series of radiating compound levers, having a leather connection to the under side of the key next the player, which pulls down the key, the flexible leather connection permitting the manual keys to work freely when the bass is played by the fingers.

An Unsatisfactory Organ.

H. W. M.—"I am a great lover of organ music and shall not rest satisfied until I own a small pipe organ with pedals. I propose to place it in a room 15 x 12 ft. square and 9 ft. high. What would be the cost and dimensions of a one manual instrument with four or five stops, and what should these stops consist of?"

Answer.—You would not rest satisfied after you had invested in a one manual organ, because you would be too limited in interpreting organ music. You would also be very much dissatisfied with the musical effect of a pipe organ in so small a room, and at the end of the year be very glad to dispose of the instrument for a quarter of what it would cost you. If you had double the length of room, or a double parlor with folding doors, a small two manual organ would be more satisfactory for practice. Even then when at the keyboard you would be too near the pipes to be charmed with the effect, as with the limited height and absence of resonance, the tones would seem to crush down upon you, and it would sound better at the remote end of the room. Such an organ should be voiced on a low pressure, and there would not be height enough to carry the open basses through.

Such an organ could a l be enclosed in a swell excepting the pedal pipes. For such a room, the following scheme would be about as small as would be worth investing in, or which would give any satisfaction to a lover of organ music.

I.

1. 8 ft. Open Diapason, lower 12 pipes St. Bass . . . . . 61 pipes.
2. 8 ft. Dulciana, lower 12 pipes Stopped Bass, Small Scale . . . . . 61 pipes.
3. 8 ft. Melodia . . . . . 61 pipes.
4. 4 ft. Octave . . . . . 61 pipes.

II.

5. 8 ft. Salicional, lower 12 pipes St. Metal . . . . . 61 pipes.
6. 8 ft. Stopped Diapason . . . . . 61 pipes.
7. 4 ft. Flute Harmonique . . . . . 61 pipes.

Ped.

8 16 ft. Bourdon . . . . . 30 pipes.

Mechanical.

9. Coupler II to I.
10. Coupler I to Ped.
11. Coupler II to Ped.
12. Tremolo.

Such an organ would cost you about $1,200. It would occupy a space 9 feet wide, 6 feet deep and 9 feet high.

The one-manual organ of which you desire a description and which has drawn forth these comments, would consist of

1. 8 ft. Open Diapason, lower 12 pipes St. Wood . . . . . 61 pipes.
2. 8 ft. Dulciana, lower 12 pipes St Wood 61 pipes.
3. 8 ft. Melodia . . . . . 61 pipes.
4. 4 ft. Flute . . . . . 61 pipes.
5. 16 ft. Pedal Bourdon . . . . . 30 pipes.

Such an organ would cost about $800 It would occupy a space 9 feet wide, 4½ feet deep a d 9 feet high.

A SHORT SERVICE PRELUDE.

The prelude published in this number of The Musician is in the melodic form of imitation. A very simple theme has its appropriate harmony throughout with no attempt at fugal imitation. The subject is introduced in the first four measures and its response is given in the succeeding four measures, the whole theme occupying eight measures.

In the sixth measure the harmony unexpectedly seems to lead to the key of F, but an interrupted resolution brings it back to the tonic. This change is suggestive of childlike trust and resignation.

The ninth measure takes up the theme in F, ending at the sixteenth measure, in the chord of the dominant seventh of G. The seventeenth measure introduces the subject in G, and at the twenty-fifth measure the final introduction of the theme is in the key of C, accompanied with a chromatic sequence of chords, the last four measures giving a rhythmic augmentation of the subject.

It takes two minutes to play it through, and it may be repeated with an entire change of registration from that which is indicated. This marking is intended for chord playing where both hands play upon the same manual in each change. In making changes of stops and manuals care must be taken to do so at the end of each phrase so that a stop shall not be drawn or taken off while a chord is sounding.

As a study in manual and pedal practice without changing the stops, take the treble with the right hand with the Gt. Melodia, the left hand taking the alto and tenor upon the Swell Manual with the Sw. Open Diapason, with the swell closed, playing the pedals with both feet, using the 16 ft. Ped. Bourdon with the sw. coupled. Different solo stops may thus be used with the appropriate contrast in the alto and tenor.

Next play with the left hand and the treble an octave lower on the Gt. Melodia and 4 ft. Flute combined, with the right hand playing the alto and tenor upon the Sw. Open Diapason, both feet playing the pedals as before.

In the novitiate studies in pedal playing there is a tendency to play the lowest part with the feet. In order to give the feet an independence of control so that pedal phrasing may be attained separate from the manual execution, it is requisite that the sympathy of the feet with the left hand should be broken. Such a study as the following suggestion, if faithfully carried out will be of much assistance in attaining this desideratum.

Shut off all pedal stops and have only the Great coupled to the pedals. If there is a 2 ft. stop in this section draw it with a 4 ft. Flute. If there is not, draw the 4 ft. Octave and 4 ft. Flute. Place the left foot upon the middle C of the pedals, which will bring down the tenor C key of the manual. Now play the treble of this Prelude throughout with both feet, so that it shall sound as smoothly as if played with the fingers. Then practice playing the melody in this way, with the right hand playing the alto and tenor upon the Swell manual, with the Salicional and St. Diapason drawn, the left hand also playing the bass upon the same manual.

This study requires much concentration of mind, and the progressive student will succeed in overcoming the difficulties which arise from this inversion of musical thought and obtain more rapid control of the feet than in any other method of breaking up the sympathy between the nerves of the hand and feet.

This Prelude forms an excellent study for these suggestions, because it is so written that each note may be easily reached without stretching the fingers more than an octave in every relation of adjacent parts.

It is one of a series designed as introductory to devotional services with the thought of preparing the mind for religious meditation, care being taken that there shall be no abrupt sensational effects to disturb a consecutive order of reflection.

Reading, Mass. Clarigold Manse.

WASTE OF TIME.

That many musicians are unreliable is a fact established beyond all dispute, but that this weakness of character is wholly one of temperament is by no means so certain. In regard to matters pertaining to the choir the majority of them will be found careless and indifferent, coming late to choir practice, and frequently remaining away for trivial excuses. But look into their ordinary business and home life, and they will be found as prompt and methodical as their less musical neighbors; so we cannot lay the fault at St. Cecilia's door. On the contrary, our charming goddess of music is a stickler for law and order. Her two pet hobbies are "time" and "form," consequently her followers should be men and women devoted to promptness and method in all their doings. The "lazy" tendency in choir matters is largely due to the example set by the leader.

Perhaps a personal reminiscence will best illustrate this proposition. Several years ago I was asked to play an organ for a few Sundays until the choir committee could decide upon a permanent organist. It was in an Episcopal Church where much is demanded of the choir, as the music is an essential part of the service, so I naturally expected the singers to be in their places promptly for rehearsal, and the leader, with his programs of the morning and evening services selected and arranged for orderly and effective practice. At the appointed hour I was at the organ, and spent twenty minutes in delightful solitude, looking over and becoming acquainted with the instrument, which was totally strange to me. Presently the leader and singers dropped in, and after some delay, we were ready for work.

The soprano opened fire by asking the director what Te Deum he intended to sing. "Well," he said, "I thought we would take Warren, in E flat," whereupon she declared it was horrid, ugly, and she simply hated the soprano solo in it. However, it was gotten out, and we went through it twice without any corrections or suggestions from Mr. Leader. There was no spirit or enthusiasm in the rendition, and it was "Warren in three flats" sure enough. Then some one suggested "Vogrich in D," and there was a general clamor for the change. (Now, if the leader had given his program proper thought, he would have known what he needed to make the service harmonious and symmetrical, and *would have had it*, in spite of the likes or dislikes of the singers) After the Te Deum was disposed of, the question of a jubilate had to be discussed. Some were for having it in chant form, others as an anthem; and so matters went on. Each canticle had to be talked over and the preference of this, that, or the other singer duly considered. At ten o'clock we dispersed, having sung only old, familiar music, and that in a careless, imperfect manner. Absolutely nothing accomplished.—*Choir Leader.*

IN THE MUSICAL WORLD

AMONG OUR SCHOOLS AND TEACHERS.

A concert was given in Dyersville, Iowa, under the direction of Mr. Pontius, of Dubuque, April 11.

Dr. Henry G. Hanchett, on April 1, began his fourth series of analytical piano recitals at Adelphi College, Brooklyn.

A varied and well-arranged program was given at a chorus concert at the Albion (Ill.) Conservatory of Music, on April 5.

Pupils of Misses Helen and Frances Quimby, of Nansemond Seminary, Suffolk, Va., gave an interesting program April 19. Numbers for piano, violin and voice were well presented.

At the weekly reception of pupils of Mr. Herve D. Wilkins, Rochester, N. Y., the time was devoted to the works of the late Ethelbert Nevin. Mr. Wilkins gave a short account of Nevin's life.

A festival is announced for Dubuque, Iowa, by Wm. H. Pontius and F. B. Benchmore. The affair is undertaken for its educational value. These concerts are to be given on May 17th and 18th, with the best of soloists. We wish the venture abundant success.

Mr. Edwin H. Pierce, formerly of Auburn, N. Y., has become director of the Holyoke College of Music, Holyoke, Mass., in place of Mr. R. W. Vincent, who has removed to California. The institution is in a flourishing condition, having at present five instructors and about one hundred and fifty students.

Mr. Edward Mayerhofer, teacher of piano, gave his last lecture-recital, for this season, on April 13, comprising all the different forms of music. They were given for the benefit of his pupils. He was assisted in the illustrations by his pupils, Mr. William Reeves, Miss Clara Cutting and Miss Florence Huntington at the piano, Mr. Emil Gerstenberger on the violin, and Miss Ada Cutting, analytical reading.

A Schubert-Schumann lecture-recital was given at the studio of Mr. and Mrs. J. Francis Cooke, Brooklyn, by Mr. and Mrs. Cooke, on April 26. The illustrative program was as follows: (I) Schumann: (*a*) "Early Green" ("Erstes Gruen"); (*b*) "'Twas in the Lovely Month of May" (Im wunderschoenen Monat Mai). (II) Schubert: (*a*) "Who is Sylvia?"; (*b*) "To Be Sung to the Waters." (III) Schumann—"A Forest Legend." (IV) Schubert—"Ave Maria." (V) Schumann—"She is Thine" (Fruehlingsnacht). Schumann—Song Cycle: Women's Love and Life (Frauenliebe und Leben), words by Adalbert von Chamiss; translated by Lewis Hovra: (I) "Ah, Since First I Saw Him"; (II) "Oh, Thou Grandest Best of Mortals"; (III) "I Dare Not"; (IV) "Oh, Ring Upon My Finger"; (V) "Come, Dearest Sisters"; (VI) "Ah! My Love, Thou Wonderest"); (VII) "Here to My Heart"; (VIII) "How Thou Hast Turned My Joy."

A very interesting concert was given at Ward Seminary, Nashville, Tenn., on April 8, by pupils of the director, Mr. Starr. The program was made up entirely from excerpts from oratorios and cantatas. As it is of general interest it is printed below. Part I—"The Creation": Chorus, "The Heaveus Are Telling," Haydu. "The Holy City": Duet, "They Shall Hunger No More"; Solo, "Eye Hath Not Seen"; Chorus, "No Shadows Yonder," Gaul. "Elijah": Angels' Trio, "Lift Thine Eyes": Solo, "If With All Your Hearts," Mendelssohn. "Ruth": Chorus, "See! the Golden Rays of Morning," Gaul. "The Coming of the King": Solo, "The Virgin's Lullaby," Buck. "The Prince of Peace": Duet, "Bright Star of Hope," Ashford. Part II—"The Holy City," Solo and Choral Sanctus, Gaul. "Theodora": Solo, "Angels Ever Bright and Fair," Handel. "The Messiah": Solo, "Come Unto Me"; Solo, "He Was Despised and Rejected"; Chorus, "Behold! The Lamb of God"; Solo, "I Know That My Redeemer Liveth," Handel. "Eli": Trio, "Thou Shalt Love the Lord," Costa. "Ruth": Wedding Chorus, "Hark! The Cymbals Clash," Gaul. The choruses were sung by fifty voices.

AT HOME.

The Christian Church of Columbus, Indiana, Wm. A. Harding, organist and choirmaster, presented an attractive Easter service.

The Pittsburg Orchestra, Victor Herbert, conductor, has been engaged to give concerts, during the month of October, at the Pan-American Exposition.

Miss Elizabeth L. Halbert gave an organ recital at the Second Presbyterian Church (place not named), in March. The program was excellently made up of real organ music.

The Nashua (N. H.) Oratorio Society, E. G. Hood, conductor, gave Mendelssohn's "Elijah," April 25. Eminent soloists assisted and the New Hampshire Philharmonic orchestra played the accompaniments.

M. Ernst Dohnanyi, the pianist who made a recent successful tour, played a Sonato for piano and 'cello of his own composition. While criticised on the score of diffuseness, it is said to show promise of power.

Philadelphians recently had the choice of hearing Melba as Gilda in "Rigoletto, at 1.45 P. M., Gadski as Santuzza in "Cavalleria," at 4.45 P. M., and Teruina in "Tosca" at 8 P. M., and yet they call Philadelphia slow.

A Vesper Service arranged from A. R. Gaul's Sacred Cantata of "The Ten Virgins," was given on Palm Sunday, March 31, 1901, in the Congregational Church, Gloversville. Mrs. F. N. E. Sparhawk, organist and director.

At Portland, Maine, Miss Annie C. Holmes, organist and director of the Choir of the Warren Congregational Church, gave an Easter program on April 6. A composition, "He is Risen," by Miss Holmes, was sung at this service.

The Beethoven String Quartet, of Philadelphia, Pa., gave a series of six fine classical concerts during the season now closing. The programs were of wide range, were excellently played and, we are glad to say, were well attended and appreciatively listened to.

Victor Herbert is to be conductor of the Pittsburg Orchestra for the next three years. A contract covering that period has just been executed, and for the first time in the history of the splendid organization its personel will be stable for a longer term than a year at a time.

Prof. Horatio Parker's oratorio, "Hora Novissima," received its seventh performance February 27, at Washington, D. C., by the Choral Society of that city under the direction of the composer. The soloists were, Mrs. Marie Kunkel Zimmerman, Miss Gertrude May Stein, Mr. E. C. Towne and Dr. Thomas S. Baker.

Mr. Henry K. Hadley went to Pittsburg to conduct the Symphony Orchestra (at Mr. Victor Herbert's invitation) in his new overture "In Bohemia." The work was favorably received by both the press and public. The score is dedicated to Mr. Herbert. Mr. Hadley has also just finished a new overture to Stephen Phillips' tragedy, "Herod."

Two concerts, on April 17 and 18, were given by the Rutland, Vt. Choral Association, under the leadership J. Harry Engels. The program comprised miscellaneous selections of high order.

There were two operas, Mr. Damrosch's Symphony concert for young people, Dohnanyi's piano recital, the Leipzig Philharmonic Orchestra's Sunday night concert, and the Verdi Requiem at the Opera house, given in New York on March 2 and 3. Varied as were the several entertainments, there was at nearly every one of them a good audience. The sum paid by those who attended is said to be $10,000.

Mr. David Bispham gave a song recital at Mendelssohn Hall, New York, March 1. "His program was quite the most comprehensive that he has yet presented, comprising as it did songs by Purcell, Arthur Somerville, Robert Franz, ballads by the inimitable Loewe, airs by Verdi and four old Irish folksongs. The singer was in good voice, and his arti tic ambition was keyed up to the top notch; consequently, his listeners enjoyed a fine treat." —*N. Y. Tribune.*

Elaborate services marked the week before Easter at the First Church of Christ, Northampton, Mass., Ralph E. Baldwin, director. Holy Week were celebrated with service in the Chapel on Mouday, Tuesday, Wednesday and Thursday afternoou at 5 o'clock. And by a Musical Service at 7.30 on Friday evening in the audience room. Other churches were invited to attend this celebration of Good Friday. "The Last Seven Words," by Dubois, was sung. This series of musical services was closed with the presentation, Easter Sunday evcuiug, of Buck's Cantata, "Christ the Victor." A quartet and chorus of thirty voices took part.

More than 4,000 persons attended Mme. Sembrich's performance of "Barber of Seville," at the Auditorium. The best seats sold for $2.00, and there were good seats at fifty ceuts. A Chicago paper says: "It was altogether a novelty to see the vast Auditorium nearly filled and realize that the occasiou was grand opera iu a foreign tongue. So pronounced and steady has been the falling off iu attendance of the operas offered by Grau in the last few seasons that the immense audience of last evening was the cause of no iuconsiderable amount of comment tending to explain the circumstances. When the true solution to the investigation is discovered it will be more nearly found in the prices charged than in auything else."

Mr. E. R. Kroeger played a lecture recital before the Union Musical Clubs of St. Louis, Mo., ou April 13. The subject was "Small Forms in Modern Pianoforte Composition," and was illustrated by the following: Bagatelle (Beethoven, in E flat, Op. 33, No. 1); Impromptu (Schubert, in A flat, Op. 142, No. 3); Novelette (Schumann, in F, Op. 21, No. 1); Berceuse (Henselt, in G flat); Nocturne (Heller, in G, Op. 91, No. 1); Spinning Song (Raff, in F sharp (La Fileuse) Op. 156, No. 2); Scherzo (Mendelssohn, in E minor, Op. 16, No. 2); Scherzo (Chopin, in C sharp minor, Op. 39); Prelude (Haberbier, in C, Op. 53, No. 1); Ballade (Brahms, in D, Op. 10, No. 2); Serenade (Rubinstein, in E flat, Op. 23, No. 2); Etude (Liszt, in D flat); Humoreske (Grieg, in A minor, Op. 6, No. 4); Song Without Words (Tschaikowsky, in F, Op. 2, No. 3); Barcarolle (Nicode, in F sharp, Op. 13, No. 3); Moments Musicale (Moszkowski, in C sharp minor, Op. 7, No. 7).

Mr. E. M. Bowman's "Temple Choir" (of the Baptist Temple, Brooklyn), gave a concert recently. This organization is unique. The musical influence of a church chorus having the purpose and size of the Temple choir supplemented of late years by an orchestra composed of talented, studious young players, is and must continue to be salutary in a high degree. Professor Bowman deserves the thanks of the hundreds of singers who have come directly under his influence and of other uncounted numbers of music lovers, who share the uplift of his labors in this community. In this choir and orchestra there are now over 200 members and to enjoy the benefits accruing from membership in either branch should be considered a valuable privilege. The magnificent body of tone exploited in the choral portions of the program on Thursday evening, the fine, uuforced quality of the voices and their brilliant attack, all gave evidence of the steady improvement that the choir is making.

The business of Geo. S. Hutchings & Co. has been incorporated under the name of Hutchings-Votey Organ Company, with the following officers and directors: Geo. S. Hutchings, President; Ernest M. Skinner, Vice-President; John H. Waterhouse, Treasurer, Directors: Geo. S. Hutchiugs, Ernest M. Skinuer, John H. Waterhouse, Samuel Carr, Frank L. Tibbets, W. J. McAvoy, Chas. W. Alden. This company has purchased all of the assets and liabilities of the old firm and has come into possession of all the patents formerly owned by Frank Roosevelt of New York, and his successors The Votey Organ Company. The Votey Organ Compauy has ceased to build organs, and hereafter all organs built by Hutchings-Votey Organ Company will be built at the factory in Boston under the personal supervision of Mr. Hutchings and Mr. Skinner. New machinery will be added to the plant, and the best men and best methods of both companies will be employed. The new company will confine themselves strictly to building pipe organs.

In May, 1877, Mme. Essipoff wanted to give a concert of American compositions at Steinway Hall, New York. To-day she would have no difficulty in making a dozen good programs of such music, but at that date it was not so easy a thing. Mrs. Crosby Adams lately came across Essipoff's program in an old scrapbook and sent it to the Chicago *Music*, from which it is reprinted here as an interesting curiosity: "Fantasia," Op. 41, "Melodie," Op. 32, Fr. Brandeis; "Gigue" (de la suite en Re pour orchestre), Bach-Parsons; "Thème et Variations" (for organ), Henry Carter; "Romance," Op. 60, Maylath; "Novelette," Op. 6, No. 1, "Prelude," Op. 6, No. 1, William H. Sherwood; 'Menuet" (from Schubert's string quartet), Op. 29, E. Perabo; "Sketches for the Piano," Op. 26 (*a*) "Wayside Flowers," (*b*) "Under the Lindens," (*c*) "Village Dance," John K. Paine; "Etude Caprice, Fairy Fingers," Op. 24, S. B. Mills; "Silver Spring," Op. 6, William Mason; "Caprice Pastorella e Cavagliere," Op. 32, "Transcription," "Home, Sweet Home," "Fantasia Grotesque," "The Banjo," L. M. Gottschalk;" "Tarentelle," Op. 91, R. Hoffman.

The Bach Choir, of Bethlehem, Pa., under the direction of J. Fred Wolle, which gave so fine a performance of Bach's B minor Mass last year, will give a Bach festival in the Moravian Church of Bethlehem, May 23, 24 and 25. There will be two performances each day; one in the afternoon at four o'clock, the other at eight o'clock in the evening. The announcement of each day's performance will be made from the belfry of the church by the choir of trombones. The three works which are to be produced entire will be given in the following order: First day, the Christmas Oratorio (first complete American performance), afternoon, Parts I, II and III; evening, Parts IV, V and VI. Second day, The Passion according to St. Matthew (first complete American performance), afternoon, Part I; evening, Part II. Third day, the Mass in B minor (second complete American performance), afternoon, the Kyrie and Gloria; evening, commencing with the Credo. The Bach Choir consists of 110 members, and in the singing of the chorales will be assisted by a choir of one hundred boys. The instrumental support will be furnished by the organ and a complete orchestra, numbering sixty performers. Program books will be issued, containing the full texts of each work and the music of the chorales which are to be sung by the audience, supported by the main chorus, the choir of boys, the orchestra and the organ. All inquiries concerning admission to the festival, railroad facilities, hotel accommodations and other details of arrangement should be addressed to the Moravian Publication Concern, No. 146 S. Main Street, Bethlehem, Pennsylvania.

Mr. Krehbiel has compiled for the *Tribune*, the following comprehensive schedule of the Metropolitan (N. Y.) Opera season:

Operas in the order of their production.	Composers.	Date of first performance.	No. times given
"Roméo et Juliette"	Gounod,	December 18,	5
"Carmen"	Bizet,	December 20,	10
"Le Nozze di Figaro"	Mozart,	December 22,	1
"Faust"	Gounod,	December 23,	9
"Lohengrin"	Wagner,	December 23,	7
"Il Barbiere di Sivlglia"	Rossini,	December 25,	4
"Don Giovanni"	Mozart,	December 27,	1
"Il Trovatore"	Verdi,	December 30,	3
"Aida"	Verdi,	January 3,	5
"Die Walküre"	Wagner,	January 5,	6
"Der Fliegende Holländer"	Wagner,	January 6,	3
"Mignon"	Thomas,	January 6,	1
"Don Pasquale"	Donizetti,	January 8,	3
"Cavalleria Rusticana"	Masengni,	January 8,	5
"Le Prophète"	Meyerbeer,	January 10,	2
"Tannhäuser"	Wagner,	January 12,	5
"I Pagliacci"	Leoncavallo,	January 20,	1
"Die Meistersinger"	Wagner,	January 21,	4
"La Traviata"	Verdi,	February 17,	2
"Les Huguenots"	Meyerbeer,	February 19,	2
"Das Rheingold"	Wagner,	February 20,	2
"L'Africaine"	Meyerbeer,	February 21,	1
"Siegfried"	Wagner,	February 27,	2
"Götterdämmerung"	Wagner,	March 1,	2
"Tristan und Isolde"	Wagner,	March 2,	3
"Rigoletto"	Verdi,	March 3,	1
"Lucia di Lammermoor"	Donizetti,	March 6,	2
"Die Lustigen Weiber"	Nicolai,	March 9,	1
"Fidelio"	Beethoven,	March 16,	1
"Il Flauto Magico"	Mozart,	March 30,	5

Out of the thirty operas given nine were by Wagner. These Wagnerian works covered thirty-four, or exactly one-third, of the performances. Five Italian, four French, and five German composers were represented in the list. Of the various artists, Dippel, the tenor, sang the most often, having appeared thirty-three times in fifteen different operas.

ABROAD.

Sir Arthur Sullivan's library is soon to be sold by auction in London.

Sig. Vannuccini, the vocal teacher of Florence, Italy, has lately given a concert which he modestly calls "Prova di Studio," at which all the performers bore English names.

Mascagni's next opera is to be called "Vestilia," and the composer is as confident as usual that it will be a triumph. He got $9200 for "Le Maschere" from his publishers before the opera had been sung at all, which is not at all bad.

The Italian Parliament, at the instance of the Minister of Public Instruction, has declared the house in which Verdi was born to be a national monument. Moreover, the Royal Conservatoire at Milan will henceforth be known as "R. Conservatorio Giuseppe Verdi."

The Opera at Prague is about to present a Gluck cycle, which will comprise his earlier works, "Le Cadi Dupe," and "La Reine du Printemps," followed by "Orphee" the two "Iphigenies," "Armide," and "Alceste," ending with "Paris et Helene" which is a novelty to musicians.

No less than thirty foreign artists appeared in Berlin during the month of January. In the matter of nationality there were 5 from France, 5 from Bohemia, 4 from Italy, 3 from Holland, 3 from America, 2 from Russia, 2 from Poland, 2 from Sweden and Norway, 1 from Hungary, 1 from Roumania, 1 from Finland and 1 from England.

Grieg has arrived in Copenhagen in perfect health and absurd reports in the continental papers towards the end of last year that the composer's mind had given way were due to a Parisian mistake. Grieg, who for some years past has suffered from a chest complaint, is in the habit of wintering at a health resort, a sanitarium something analogous to our springs. Thus rumors come and go.

The new Prince Regent Theatre in Munich is going into actual rivalry with Bayreuth during the coming season. "Die Meistersinger," "Tristan und Isolde," "Tannhäuser," and "Lohengrin" are to be sung under Ernest von Passart's direction by the best artists available in Germany and with elaborate spectacular features. Among the outside singers engaged are Theodore Reichmann, Wilhelm Gruening, Herman Winkelmann, and Gisela Staudigl.

Paderewski played before Queen Victoria at Windsor Castle last June, and he will never, he says, forget the impression made upon him by "the intelligence and goodness, and by the interest in and knowledge of music which this glorious woman was kind enough to show on the occasion. Her Majesty," he continued, "inquired concerning some music that I had played before her eight years previously, remembering even the shortest pieces. I shall never forget her."

A story of Verdi's hatred of hand organs is told with much corroborative detail by a journalist who visited him once at Moncalieri. He says that Verdi lived in one room as sleeping-room, study and dining-room. But the composer opened the doors and showed two much larger rooms in the distance. They were filled with hand organs. "On my arrival," the maestro said, "these organs played airs from "Rigoletto," "Trovatore," and other operas of mine, and that angered me so that I rented the lot for the season. It cost me $300, but I had peace at all events."

Rubinstein, during his last series of historical concerts, given by him in London, was asked by friends what his opinion was on the subject of musical prodigies. The maestro, shaking his leonine head, replied, "I have no faith in them; they promise much, but always disappoint our expectations. One exception only can I make, and that is in favor of a little boy whom I heard play the other day in Varsowie. His name is—Josef Hoffmann." This was said in 1886. Josef was then a little boy of nine years old, and save in his marvelous pianistic ability neither physically nor mentally precocious, being a true boy.

For many years Sir John Stainer, whose death occurred in London on the 31st of March last, has held the position as the foremost church musician in England. He was distinguished as an organist, a composer and a writer. In the former capacity he filled for a long time the position of organist of St. Paul's Cathedral, London. As a composer he is known by a large number of anthems, which are marked by melody and dramatic power, and evidence a decided advance over the works previously in vogue in the English Church. Many of these authems are in use in American churches, and are well known to our organists and choirs. John Stainer was born in 1840, was a choir boy in St. Paul's, and became organist of the Cathedral in 1872, after playing previously in various churches. He succeeded John Goss at St. Paul's. His most successful composition is "The Daughter of Jairus," dating from 1878. He has written various works on harmony, has held offices in the leading musical organizations of England, and leaves a deep impress on the musical history of the English Church. On his retirement from St. Paul's Sir John Stainer—for he was knighted in 1888—devoted his time to musical composition and to his interests in musical societies.

PUBLISHER'S COLUMN.

The music supplement for this month begins with a song worthy the attention of any singer. "Soldier's Departure," by W. W. Gilchrist, is a musician's song, yet it does not lack interest for the general body of singers. It makes demands on the vocalist, but with what effect it repays them! The accompaniment, without being difficult, is a feature of the song. The "Menuet Radin," by Victor Dolmetsch, which follows, is original, striking in rhythm and can be made very effective, when played with an understanding of its peculiarities. Its well-contrasted themes add to its interest. Somewhat lighter, and considerably easier, is "Dance of the Sylphs," by W. Lege. It is none the less worthy a place in the supplement, for it is an excellent teaching piece. "Pursuit of Love," by William Benbow, is rather dramatic, requiring of the singer well-controlled tone. It should please the particular singer. Short, but decidedly pleasing, is "Sprites at Work," by N. von Wilm. It is thoroughly characteristic. In what, perhaps, might be called a more popular vein is "With the Guitar," by W. Cooper. It is a good salon piece, and, besides, contains some good teaching points. "The Rumbling of the Mill," by Kirchner, is a descriptive piece that really describes. The rumble of the mill can be heard as it is played. The supplement is concluded with a "Short Service Prelude for the Organ," by William Horatio Clarke. Of this there is an analysis in the organ department.

***

THE MUSICIAN for May continues the policy of the editor in having its pages filled with varied articles of direct educational interest. Of value to every teacher is the article by S. N. Penfield on "A Critique and Some Comments Thereon." He has filled it with sound common sense, which makes it valuable reading. The Teachers' Forum is being read by many, as the practical suggestions in this issue show, and it is hoped that there will be a still greater use of its advantages. The publishers were congratulated on the April number, and they feel sure this will be equally well received.

***

THE MUSICIAN *wants to keep in close touch* with teachers and schools in all sections, and the editor believes that space devoted to reports of concerts, recitals, lectures on musical subjects and musical events of general interest would prove interesting to readers You can aid him in making an interesting feature of this department by sending reports of musical happenings that will interest your fellow teachers in other localities.

***

Mention was made last month of two letters received by the publishers regarding the music published in each issue. As we wish to give our readers a full opportunity to express their opinions, we reprint the request made at that time. One of these letters complains that the music is so poor that it cannot be used that the writer has seen only two good pieces in the journal during the last few months. The other says the music is not popular enough, and cannot be used on that account. Here are two statements directly contradictory, both coming from friends of the journal, who mean their criticism kindly. The publishers surely are placed in a dilemma, for these letters are but representative of many others equally divergent in views The question is, what sort of music shall be published in THE MUSICIAN? The journal is published for the benefit of its readers, and it is their wishes that the publishers want to satisfy. But what are these wishes? How are they to know what sort of music is really desired?

They are willing to publish just such a class of music, and of just such grades of difficulty as will best answer the purposes of their readers. They have no hobbies of their own to satisfy, and in an effort to arrive at a conclusion, they not only ask but urge every reader of THE MUSICIAN, who is interested in this question, to send them a plain and *definite* statement of the kind and grade of music he or she would prefer to have published in each month's issue. Kindly respond promptly and fully so that there can be no misunderstanding. Remember that there are twenty-four pages devoted to music and that variety is necessary as well as quality. We await these statements with expectancy and will give them the fullest consideration.

***

Wants.—The time is near at hand when it will be necessary to make plans for next season. Teachers who desire to make changes, and schools and colleges needing new or additional help, should take advantage of the *Want Column* of THE MUSICIAN. Wants not exceeding five lines are inserted free, and but a nominal charge is made for advertisements exceeding this limit.

As much space as may be needed to help its readers secure positions or obtain help will be used.

Are You Certain that you are buying your music at as good rates of discount as your fellow teachers? If not, you are doing business at a *disadvantage*. *We claim* that the discounts we allow teachers are MUCH BETTER than offered by other dealers, and unless you have had our latest quotations, you *cannot* be sure that you are not paying *more* for your supplies. This applies not only to our own publications, but to ALL the music you use. On our own publications we offer such liberal discounts (which will be supplied on request) that, no matter how far distant you are, or the cost of Postage or Express, we GUARANTEE you a saving when purchasing from us. In this connection you should remember that we send liberal selections of the latest and most desirable music "ON SALE," with the privilege of returning and having credited, at the end of the teaching season, all that has not been sold or used. Full particulars regarding this department of our business may be had on request. We also offer numerous additional advantages which it is impossible to mention in the limited space of this page. *Write us!* No trouble to answer your letters and inquiries. It will pay you to correspond with a house that is progressive and up-to-date in all of its dealings. We can save you time, trouble and money. We suggest that you give us an opportunity to demonstrate this fact by sending us a trial order, it will bring us your steady patronage.

***

The publishers of THE MUSICIAN have exceptional facilities for printing sheet music and music books. Upon receipt of manuscript, with full particulars concerning the style of publication desired, we will submit complete estimate.

***

Guide to Practical Musicianship, by A. J. Goodrich, has been received with much favor. It is a very valuable and practical work, and is the *only work* on this subject. Teachers would do well to see that each pupil has a copy, because the practical results from its use are really wonderful.

***

NEW PUBLICATIONS.

The new music listed below ranges, as regards the piano music, from Grade II to Grade IV, with none beyond easy IV. The piano music averages well as to quality and can be made available for teaching purposes. The songs are more uneven, but include some ex ellent ones.

SONGS.

Ah, Love, But a Day. Key B minor; B to G. J. Pascal. 40c. A very good dramatic song. Makes some demands on the singer in the way of control of tone and declamation. Worthy of study.

I Heard the Voice of Jesus Say. Key D: C to G. J. H. Rogers. 50c. A good sacred song. A quite fresh setting of much-used words.

Lullaby Land. Key G: D to G. L. C. True. 50c. Graceful and piquant. Excellent to sing and certain to please.

Sig No More, Ladies. Key A flat: C to F. J. H. Rogers. 50c.

When All the World is Young, Lad! Key C: C to E. E. R. Noyes. 50c. The above are good songs for concert programs. Bright and vivacious, they are attractive.

The Little French Clock. Key E flat: E flat to B flat. Selli Simonson. 50.

The Mountain's Fairest Flower. Key B flat: D to E. William E. Bock. 50c.

Thou King All Glorious. Key A flat: E to F. Fred. Rycroft. 50c. A popular sacred song. Without possession of special merit, it is worthy of use.

I've Found That I Love You. Key A flat: C to F. John E. McWade. 50c. Has a refrain in valse movement that is somewhat florid. A good study song.

Day Dreams. Key E flat: E flat to G. Arthur Trevelyan. 50c.

Look Into Mine Eyes, Dear Heart. Key E flat: E flat to E flat. 50c.

PIANO.

Chansonette. Op. 15, No. 4. J. H. Rogers. 40c. A good teaching piece. Well written and with clearly defined theme, it affords excellent practice in phrasing.

Danse Caprice. W. Berwald. 50c. Another excellent composition. Considerably more difficult than the preceding. Useful for concert purposes.

Festival Minuet. Op. 19, No. 1. L. E. Orth. 60c. This, too, is a good—and very pretty—teaching piece.

Jolly Mountaineer. E. Otto. 50c.

Hazelle Waltzes. H. Tappan. 75c. Graceful, and not hard to play.

Joyous Moment. E. Otto. 50c.

Palmetto Dance. E. Otto. 50c.

Scherzo-Valse. W. Berwald. 65c.

Serenade. W. Berwald. 50c. The above are two characteristic compositions that will please teachers. They are fresh and interesting.

You and I Waltz. E. Otto. 50c. Good practice in thirds and octaves. Very bright.

In Crakow. Polish Dance. Herman Perlet. 50c. A characteristic piece. Brilliant without undue difficulty.

Belle of Buffalo. March. Jon Arnold. 50c.

The Mosquitos' Parade. Duet. Karl L. Hoschna. 60c. Brilliant and easy.

Love's Sympathy Waltz. W. H. Nelson. 50c.

When You Were Sweet Sixteen. Waltz. Karl L. Hoschna. 50c.

While Old Glory Waves. March. Anton Heindl. 50c.

One Thought of Thee. Waltz. J. W. Buford. 60c.

SERVICE MUSIC.

An Evening Song Service. "Christ's Power Over Nature." 5c.

Garland of Gladness. S. S. Service. F. A. Fillmore. 5c.

Theoretical Statements and Catechism from the "Choral Standard." B. C. Unseld. 10c

Perkins' Church Anthems. W. O. Perkins.

MALE VOICES.

He is Risen. C —. C. Simper. 12c.

FEMALE VOICES.

Calvary. F. F. Q. Dulcken. 10c.

Music on Sale for the Summer Months.—With many teachers the summer months are the busiest of the year. We supply selections of music for use during these months, and returns need not be made until October 1st. A majority of publishers object to sending music "on sale" during the summer, hence our offer may be appreciated. Complete catalogue from which you can make up your own selection, if you prefer to do so, will be sent upon request, or we will make the selection on receipt of information as to as to number of pupils, grades, style of music desired, etc.

***

Our Publications are noted for correctness and beauty. We carry a complete line of all Foreign and American publications. Our facilities for promptly filling all orders are unequalled.

Our *Special Novelty Offer*—an original plan by which you can obtain one copy each of our new sheet music publications at nominal cost—will interest you. Full particulars will be sent upon application.

***

Agents Wanted.—THE MUSICIAN wants good, live representatives to solicit subscriptions. Those having a knowledge of music preferred. Full particulars, including sample copies, order blanks, other helps and terms, will be sent to all who desire to make a trial of this work. No other field of subscription work offers such liberal inducements.

***

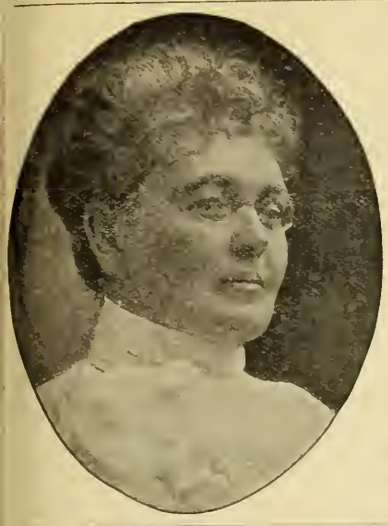
If in need of a Metronome, one that will give entire satisfaction (all others are worthless) and last a lifetime, send your order to the Hatch Music Co. Owing to the increased cost of manufacturing Metronomes, prices have been advanced by nearly all dealers. We still offer them at the old prices—another proof of our claim that you save money by purchasing from us. We handle only the best makes, and guarantee every instrument for two years. All complaints receive careful attention and prompt adjustment. Our prices ($2.50 and $3.50) are very low, and we offer an extra discount on orders for six or more instruments.

A SUMMER NORMAL MUSIC SCHOOL

For Artists and Artistic Teachers, will be held by MR. and MRS. FREDERIC HORACE CLARK, Steinway Hall, Chicago, 1901.

RATES OF TUITION, PRACTICE AND BOARD WILL BE LOW.

The aim of this school is to popularize Unified Art, especially the New Free Pianism, but Mr. Clark will receive Vocalists and Violinists wishing harmonic interpretation, positive musical criticism and self-measurement. Teachers can place themselves on a high basis, above competition, by taking a course in this school. Send 25 cents for a copy of Mr. Clark's new Philosophical Music Magazine.



Burrowes Musical Kindergarten Method

INSTRUCTION FOR MUSIC TEACHERS BY HOME STUDY.

THE FIRST EDITION of the Manual of Instruction for Teachers by Home Study has been ENTIRELY EXHAUSTED, owing to the rapidly increasing demand for the Burrowes Method, and a NEW, IMPROVED AND GREATLY ENLARGED EDITION is now being issued from the press.

YOU ARE REMINDED that this Method may be acquired advantageously at any season of the year.

IT IS GOOD to introduce the Method in the third or fourth term. In this way the teacher may learn the Method fully and secure some testimonials; and so when the schools re-open in the following autumn he will be in a position to advertise and talk to parents from his own experience, and will doubtless be more successful than if he had acquired the Method just before the autumn term began.

YOU CAN BEST learn the Method by its actual use with a class, and it is not necessary that you should be completely familiar with it before beginning to teach. The lessons in the Teachers' Manual are laid out very minutely, so that after a day or two of study the teacher may begin to impart the earlier lessons, and may POST HIMSELF ON THE SUCCEEDING ONES AS THE CLASS PROGRESSES.

THE BURROWES METHOD was built up for children and from actual study of the needs, preferences, character, and even the whims of children. The authoress has taught a musical kindergarten for many years, during which she has composed songs, invented games, and constructed apparatus too numerous and varied to mention or describe; and of these only the most valuable have been retained. Everything that was dull, cumbersome, ineffective, or unchildlike has been abandoned, and what remains has been tested through and through, and its value proved beyond the shadow of a doubt. There is nothing in it that is not agreeable and entertaining. IT IS NOT BUILT ON MERE THEORIES. It is not the inspiration of a day. It is, on the contrary, the CREAM OF FIVE YEARS OF SPECIAL EFFORT, and the fruit of many other years of toil and study. The results speak for themselves.

THE MANUAL will enable any teacher of music to carry a kindergarten class through 120 lessons.

MUSIC TEACHERS OF ALL GRADES should investigate this work. ADVANCED TEACHERS will profit largely by establishing kindergartens in charge of an assistant or partner, thus creating a preparatory department which will act as a leader to the advanced classes. The advantages of the Method to YOUNG TEACHERS is obvious.

KATHARINE BURROWES, A 1302 Presbyterian Bldg., Fifth Ave., New York.

Send your address, and a beautifully illustrated SOUVENIR BOOKLET will be mailed free.

Western Address, 618 Second Ave., Detroit, Mich.

Fletcher Music Method

(SIMPLEX AND KINDERGARTEN)

The aim of the Method is to eliminate the drudgery of the study of music and to give a fundamental, systematic and logical musical education in a thorough, natural and pleasurable way; and so make it possible for Music to exercise her three-fold power of development. The System was originated by Evelyn Ashton Fletcher, and the following are a few of the many endorsers and a partial list of the Conservatories in which the System has been adopted.

Dr. Wm. Mason, New York.
Mrs. John Vance Cheney.
Madame Hopekirk.
Phllip Sousa.
Franklin Taylor.
Dr. Gerrit Smith, New York.
Wm. Tomlins, Chicago.
Dr. Hugo Riemann, Leipsic.
Dr. Wm. Cummings, London, Eng.
Thomas Tapper.
Kate S. Chittenden, New York.
And others.

University of the State of New York.
Institute of Applied Music, New York.
Departments—Metropolitan College of Music, Metropolitan Conservatory of Music, American Institute of Normal Methods, Synthetic Piano School, Fletcher Music Method.
American Conservatory, Chicago.
Gottschalk Lyric School, Chicago.
Mrs. John Vance Cheney School, Chicago.
Detroit Conservatory.
Broad Street Conservatory, Philadelphia. And others.
Also In the Eleven Leading Conservatories or Colleges of Music In Canada.

There are already over 250 teachers of the System, but the demand is greatly increasing Miss Fletcher studied for five years in Europe, and has already successfully introduced her System in the European centres, Leipsic, Berlin, Brussels and Paris. Special advantages to those willing to go abroad with the System. The different sets of apparatus invented by Miss Fletcher are fully protected by patents in Canada, the United States, England, Germany, France, Switzerland, etc. This System can not be taught by mail, and the Fletcher certificate of authorization to teach is only obtainable, with the apparatus, by taking the course of instruction. Write for information and circulars with letters of endorsement, to Miss Evelyn Ashton Fletcher, 1125 Madison Ave., or Mrs. E. A. Sturgeon, 5155 Cornell Ave, Chicago, or to the Corresponding Secretary of the Fletcher Musical Association, Miss La B. Brown, the Nightingale, Dudley St., Roxbury, Boston.

Public School Music Teachers

Should send 5 cents for the May number of

Fillmore's "Musical Messenger."

This number contains

Six Music Lessons

as they were actually given in the different grades of the public school, by Prof. Henry M. Butler, April 11, 1901.

These lessons were witnessed by Mr. J. H. Fillmore, and were reported by an *expert stenographer.*

Address, FILLMORE BROS.
119 W. 6th Street, Cincinnati, O

Musical Rhythms for Piano. By Arnold D. Scammell.

With an Introduction by MRS. CROSBY ADAMS. Of interest to every Teacher. Pupils are delighted with them. Develops a refined musical taste. The Introduction is well worth the price.

Attractively Bound. Price, $1.00.

This book is the direct outgrowth of a need expressed by both teachers and pupils for certain definite rhythms which shall suit the times which come to all of us, when something "in lighter vein" is demanded. To supply this need, by giving marked rhythm as well as tuneful melody is the task set himself by the composer, Mr. Scammell. That these requirements have been met, the work itself is the evidence. The pieces lie well under the hand, do not require much technical equipment, and, best of all, carry themselves easily along by the charm of the rhythm. Mr. Scammell has been fortunate in having the experienced judgment of Mrs. Crosby Adams in the preparation of his work. Teachers will welcome to their teaching list these compositions suited to the natural and healthy demands of a certain phase of the pupil's experience because, while the pieces are indeed "light" they are not commonplace, and will therefore help instead of hinder the progress of the pupil's development towards a refined musical taste.

Pretty Picture Songs for Little Folks By G. A. Grant-Schaefer and Walt M. Dekalb. .75

What the Chicago Press says of it:
"Artistically there is not a more attractive juvenile book on the market."—Chicago *Times-Herald.*
"The melodies are attractive and catchy."—Chicago *Tribune.* "Should be in every Christmas stocking."—*The Elite.*

Wee Wee Songs for Little Tots By C. H. McCURRIE and WALT M. DEKALB. .50

Nearly 5,000 sold and demand constantly increasing. Praised by old and young alike.

Songs That the Children Sing By MRS. L. D. FESSENDEN and MRS. V. A. BARBER .75

Contains two charming operettas and six solos. Nothing better can be found for school and home use. Both words and music are captivating.

Thirty Standard and Popular Operas

ARRANGED FOR VIOLIN AND PIANO

By A. S. BOWMAN.

Violin and Piano, 200 Pages. Violin, 64 Pages.

In this superb collection, the compiler has displayed taste of the most eclectic character, his selections comprising the various "schools" of music—French, German, Italian and English—and ranging in style from grave to gay. In one compact volume, grand opera, opera *comique* and opera *bouffe*, have contributed their choicest melodies. The list includes the great operatic successes of a generation ago and passes, in continuous order, to those of the present day; we have Rossini, Donizetti, Verdi, Wagner, Bizet and Mascagni, in close relation. In the arrangement, that happy medium has been reached which presents just enough difficulty to interest the player without proving troublesome or overtaxing the powers of the average performer. Without exception, it is the most useful and entertaining work of its character in print.

"Thirty Standard and Popular Operas," for Violin and Piano, is a handsome volume of 200 pages, bound in half cloth. The same, for Violin, contains 64 pages and is neatly bound in paper. Both are printed from new plates, on a fine quality of music-book paper. No expense has been spared to make them perfect in every respect.

CONTENTS.

Aida . . . . . *Verdi*	La Traviata . . . . . *Verdi*
Beggar (The) Student . . . . . *Millocker*	Lohengrin . . . . . *Wagner*

Avoids all necessity for either rolling or folding sheet music or books. A substantial satchel, made for service.
If to be sent by mail, add 22 cents.

POPULAR SELECTIONS

—FOR—

MANDOLIN AND PIANO

By JOHN J. EBERHARDT.

Mr. Eberhardt, well known as a composer and arranger of music for the mandolin, and for mandolin clubs, is also leader of one of the most popular clubs in the United States. We have, therefore, no hesitation in recommending anything that he may offer in this particular line.

"Popular Selections" is a large book (9½ x 12 inches) of 128 pages, printed from engraved plates, on fine quality toned music-book paper; it has an attractive cover. We refer to the contents—see list—as we believe that this will give a much better idea of the book's value than anything else we could add in the way of a description.

CONTENTS.

Ah! What Pure Delight (Bohemian Girl) . *Balfe*	In Happy Moments (Maritana) . . . *Wallace*

METRONOMES

FULLY WARRANTED.

MAELZEL SYSTEM
ACCURATE AND RELIABLE.

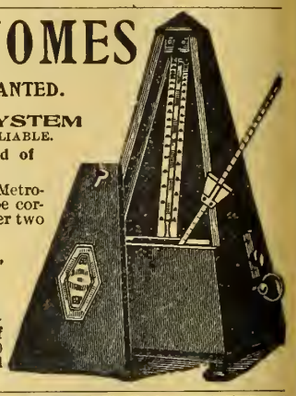
Quick and Easy Method of Measuring Time.

We advise the use of a Metronome, so that time may be correctly interpreted. We offer two styles at special prices:

Mahogany, without Bell, $2.50.

Mahogany, with Bell $3.50.

Prices quoted do not include Express or Mail. If ordered by mail, add 40 cents to the price quoted for each style.



Carcassi's Complete Method for the Guitar

So far as the musical public is concerned, there is no excuse for a new edition of an old favorite unless it offers some special advantage. It must be superior to all other editions if it is to supplant them. By the use of new plates, an excellent quality of music-book paper, careful press work and substantial binding, we have produced a book which cannot fail to take the place of the inferior editions so long in use. Compare ours with that which you have been using; nothing more is needed to win your favor. The cover of our edition is illustrated by a guitar and a full scale of the instrument. *English and French Text.*

Half Cloth Binding. Price, $1.50.

WITH

Practical Suggestions

TO

Students of Music.

Is Entirely New and Superior to Anything of Similar Character That Has Ever Been Offered.

The Tablet is 6⅞ x 10⅜ Ins.

It contains 100 Sheets—each with 12 staves. The paper is first-class—suitable for writing with either pen or pencil. The leaves are perforated so that they can readily be removed. Second page of cover contains, for ready reference, the following: Notation, Display of Tetrachords, Cycle of Keys, Condensed History of the Minor Scale, Relationship of the Minor Scale. Manchester's is so much superior to all other tablets, that an examination will insure its use.

Price, 20 Cents.

By Mail, 28 Cents.

Liberal discount when ordered in quantities.

Musical Memory and its Cultivation

Also an Investigation into the Forms of Memory Employed in Pianoforte Playing and a Theory as to the Relative Extent of the Employment of Such Forms

By FREDERICK G. SHINN, Mus. Doc., Dunelm.

The purpose of the work is twofold: *First*, an inquiry into the various forms of memory employed in piano playing and the formation of a theory with regard to the relative extent of the employment of the various forms by different individuals. *Second*, to repeat, with the strongest possible emphasis, that Ear-training, which is largely a cultivation of the musical memory, is THE FACT of all musical education.

"MUSICAL MEMORY AND ITS CULTIVATION" is divided into two parts. *Part 1* contains seven chapters, as follows: General and Special Memory; Musical Memory; Musical Memory in Connection with Practical Execution; Muscular Memory; Visual Memory; Intellectual Memory; Relative Extent of the Employment of the Different Forms of Memory. *Part 2* contains six chapters, as follows: Necessity for the Cultivation of Musical Memory; General Conditions Favorable to Memorizing; Suggestions for a Scheme of Memory Training; Method of Studying Pieces for Memorization; Memory Training and Examination Schemes; Memories of Musicians.

A valuable work which should be read and studied by all musicians.

Paper Binding. Price, 50 Cents.

Sieber's 36 Elementary Vocalises

Op. 92-97 Inclusive

FOR SOPRANO, MEZZO SOPRANO, ALTO, TENOR, BARITONE AND BASS

With Introductory Notes by FREDERIC W. ROOT.

Sieber's 36 Eight Measure Vocalises, for all voices, are well known and appreciated by teachers. The composer had a double object in view and prepared them for use in the school, as well as for self-study at home. The hook for each voice differs from the companion volumes, as the exercises were written with especial regard for the voice part under consideration. Each study is contained within eight bars—therefore do not become tedious—and are written with the *sol fa* syllables, also with an ingenious and effective set of vowel sounds designed by the composer, who is a teacher of European celebrity. All of his studies are melodious and interesting.

Our new edition is, in every respect, the finest in print. These studies have, heretofore, been published only in sheet music form, at $1 50 each. While our new edition is of much more convenient size and much handsomer in every way, it is sold for 50 cents per copy.

Mr. Frederic W. Root says: "The new edition of Sieber's Exercises are beautifully gotten out and I hope will be properly appreciated. I congratulate you upon the edition and hope to use it in my teaching for many a year."

Paper Binding. Price, 50c. Each.

CLASSIC PIANO SOLOS

VOLS. 1-2.

Superb Collections by Eminent Authors.

While the contents of Volume 1 is largely made up of the works of the older masters, with but few exceptions the pieces included in Volume 2 are the works of the more modern classical writers, many of whom are still living. All of the compositions of both volumes are within the capabilities of the ordinarily good performer and will be found most interesting whether used for purposes of recreation or instruction. We ask a critical examination and comparison with works of similar character.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

Classic Piano Solos for Young People

VOLS. 1-2.

ELEGANT COLLECTIONS BY WELL-KNOWN WRITERS.

Classics selected for the young are frequently of the dryest character and students are too apt to absorb the idea that good music *must be dull*. In the preparation of these collections the requirements of the youthful mind were kept in view, and the selection of works will prove that music of an advanced standard can be pleasing as well as useful in the formation of a correct and pure musical taste. These works are unequalled by any similar publications of corresponding grade. A critical comparison will establish our claims of superiority.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

BEHR, F.

Op. 503, No. 30. Au Revoir (Auf Wiedersehn) 20
A tender little melody, which sings out its good-bye hopefully. Requires a loose, quiet wrist and singing legato finger touch.

Op. 508, No. 18. Bird's Message (Vögleins Botschaft) 20
This makes somewhat greater demands on the player. Its bird imitation makes use of the added lines, which must be read quickly. A light wrist and flexible fingers are needed.

Op. 426, No. 1 Congratulation (Glückwunsch) 20
These congratulations are hearty and the piece should be played sturdily, but with no tendency toward hardness of tone. It is a useful teaching piece.

Ethel Polka 20
A sprightly little dance, bright in melody and easy in accompaniment. A good study in wrist touch and staccato.

Op. 575, No. 23. Farewell to Home (Abschied von der Heimath) 20
Somewhat similar in nature to An Revoir, but more difficult. It is very pretty and sure to please the pupil.

Op. 575, No 1 French Child's Song (Französisches Kinderliedchen) 20
A quite easy first piece with a good tune to it. It is entirely in position.

Grandpapa's Dance (Grossvater's Tänzchen) 20
Grandpapa must be a jolly old fellow, for his dance is quite gay. Another good exercise in wrist staccato.

Op. 575, No 2. In the Month of May (Im Mai) 20
A song of spring, bright and tuneful. It is a good first piece.

Op 426, No. 5 Italian Song (Italienisches Lied) 20
This requires more musical perception from the pupil and, given at proper time, will be a good study in phrasing. The reiterated chords in left hand must be watched.

Kindergarten Waltz 20
A very graceful waltz, not hard to play, but pleasing. Should be carefully phrased.

Night in May (Mainacht) 20
It is a splendid piece for teaching purposes. It is clear in form, interesting in treatment and attractive in melody and harmony.

Night Patrol (Nächtliche Runde) 20
A good staccato is demanded in this piece. Its martial character is pronounced. Bright and interesting.

Parade of the Guard (Wachtparade) 20
Somewhat similar to the preceding, but more lively. Partakes more of the character of the two-step. We can easily imagine the guard swinging by at double quick.

Op. 426, No. 3. Star Greeting (Sternengruss) 20
Of quite different style. Phrases are well marked and a smooth, singing legato is necessary in both hands.

BIEHL, A.

Op. 53. No. 2. Dance on the Lawn (Tänzchen im Freien) 20
This dance shows the frisky disposition of the dancers. It is not difficult, but pleasing.

Op. 52, No 14 The Clock (Die Wanduhr) 20
Very characteristic. The left hand adds much to the effect and should be well played.

Op. 53. No. 7. Garland Weaving (Beim Kränzewinden) 20
A beautiful little piece. The second part makes some demands upon the left hand. Well worth study.

Op. 52, No. 15 Little Soldiers' March (Kleiner Soldaten Marsch) 20
An attractive study in chord playing in left hand, with a good tune in the right. Not hard, but pleasing.

Op 52, No. 10 Picnic Dance 20
Exemplifies its name. A jolly dance, such as happy picnicers would indulge in. Good teaching piece.

Op 53, No 1. Wild Rider (Der Wilde Reiter) 20
A good descriptive piece, requiring firm tone and light wrists and arms. Good study.

BOLCK, O.

Op. 68, No. 1. Weaving Garlands (Beim Kränzewinden) 20
A very tuneful melody with broken chord accompaniment. Attractive without undue difficulty.

ENGELMANN, H.

Op. 408 No. 4. Humpty Dumpty Schottische 25
A brisk Schottische. Like all of Engelmann's pieces, it is full of melody and interestingly harmonized.

Op 422, No. 3 King's Delight Mazurka 25
A characteristic Mazurka by same author. Good practice in phrasing. Not difficult.

Op. 408, No. 5. Little Boy Blue March 25
A good march. Excellent practice in wrist touch. Sure to please.

Op. 408, No. 1. Mother Hubbard Waltz 25
A graceful waltz, no hard places to discourage the young player.

Op. 422, No. 5 Old King Cole's March 25
A bright piece, good for teaching purposes and sure to interest the pupil.

Op. 422, No. 1 Start Up Waltz 25
Sure to start the pupil to practicing it with vigor. It is easy, bright and lively.

GOERDELER, R.

Lullaby 25
A beautiful melody which gives opportunity for cultivating a singing tone. Very interesting.

Merry-Go-Round 25
A joyous little piece. Phrases are well defined, and will aid the pupil in understanding simple form.

Sweet Evelyn Waltz 25
An attractive little waltz of no particular difficulty. Melody of first part is in left hand. Effect of tie is good.

GURLITT, C.

Op. 130, No. 6. March of the Tin Soldiers (Zinnsoldaten Marsch) 20
Melody is given out by right hand and is then repeated in left. In six-eight measure. Very good.

HELLER, M. P.

Op. 6, No 3. On the Playground (Auf dem Spielplatz) 20
A good study piece. The slurs give practice in lifting hand after binding two notes. A contrasted legato melody in second part should be carefully played.

HILLER, P.

Op 66, No. 2. Grandmother's Dream 20
An excellent study piece. Its subjects are well contrasted and the work is evenly distributed.

Op. 66, No. 3 Lonely Rose 20
In the minor. The loneliness of the flower is told quite well. A singing legato and a chance for expression are its distinguishing features.

KÖHLER, L.

Op. 210, No. 4. At Home (Am Gemüthlichen Pätzchen) 20
Quiet contentment characterizes this little piece.

KÜGELE, R.

Doll's Dance (Puppentanz) 20
There must be lively dolls, for this dance is full of go. Beside being a good teaching piece, it is sure to please.

LANGE, G.

Op. 249, No. 1. In Rank and File 35
Erect and vigorous these soldiers march by. Occasionally the roll of the drum is heard. Not difficult.

LICHNER, H.

Op. 78, No 4 First Ball. Rondino 35
Some good finger work can be gotten from this piece, which is tuneful and gay. A crisp staccato is necessary also.

Op. 57, No. 3. Twinkling Feet Waltz 20
Simple and free from catchy places, this waltz is nevertheless very attractive. If played daintily, it is very characteristic.

MERKEL, G.

Op 31, No. 1. Children's March (Kindermarsch) 20
Short, but it is full of music. It should be played with decision.

PRIDHAM, J.

Fairies' Waltz 30
Its two subjects require somewhat different treatment. The first, a quiet hand and firm finger touch. The second, a light wrist touch changing to a finger touch for the runs. Very bright and pleasing.

REINECKE, C.

Op. 107, No. 12. Children and Cuckoo (Kinder und Kukuk) 20
The children's song and the call of the cuckoo are heard here. The children at times break off their song to imitate the bird. Instructive as well as pleasing.

RUMMEL, J.

March 20
A good example of this form. Bright and effective.

SARTORIO, A.

Op. 229, No. 7. Dreams of Youth (Jugendträume). Polka Mazurka 20
Good practice in dotted-eighth and sixteenth rhythm, and in double notes. Tuneful and without hard places.

Op 229, No. 2. Italian Song (Italienisches Liedchen) Barcarolle 20
A singing melody with a broken chord accompaniment. Excellent practice in phrasing.

Op. 229, No. 3. Military March (Militair Marsch) 20
A good march somewhat more difficult than those before mentioned. Well controlled arms and hands are needed. Results will be good.

SCHUMANN, R.

Op. 68, No. 10. Happy Peasant (Fröhlicher Landmann) 20
Too well known to need comment. With it is a Hunting Song, which is an excellent companion.

THOMÉ, F.

Melodie 20
A very beautiful piece. Its exquisite melody should be played with a full singing legato. The first bass note of each measure is staccato, making a peculiarly effective accompaniment.

WOLFF, G. T.

Op. 25, No 11. Mill by the Brook (Mühle am Bache) 20
Brisk and characteristic. The clatter of the mill is given first with the right, then with the left hand.

WOOLER, A.

Golden Sunset 25
Especially useful for the running work in left hand. Very pleasing.

Published by **HATCH MUSIC COMPANY**, Philadelphia.

CHOICE NUMBERS

FROM THE

"Hatch Edition"

Diminished reproduction of cover plate used on the "Hatch Edition."

All numbers included in this list have been carefully edited and annotated by leading American teachers, our corps of editors including: W. S. B. Mathews, Wm. H. Sherwood, Frank H. Tubbs, Frederic W. Root, R. S. Goldbeck, Jaroslaw de Zielinski, J. S. Van Cleve, Thos. a'Becket, Wilson G. Smith, H. C. Macdougall, Bernhard Listemann, etc. This important work has never been attempted by any other publisher. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Regardless of the additional expense involved in the publication of annotated editions, prices have not been advanced, but are the same as those charged for ordinary reprints of the works included in this list.

No. 28. BURGMÜLLER. Op. 100. Twenty-five Easy Studies for the Pianoforte 1 00
Revised, fingered and annotated by Jaroslaw de Zielinski.

No. 29. CHOPIN. Nocturnes for the Pianoforte 75
Revised and fingered by Carl Mikuli.

No. 31. CHOPIN. Waltzes for the Pianoforte 50
Revised and fingered by Carl Mikuli.

No. 32. CHOPIN ALBUM. Thirty-two Favorite Compositions for the Pianoforte 1 00
Revised and fingered by Carl Mikuli.

No. 30. CLEMENTI. Sonatinas for the Pianoforte 50
Edited and annotated (after Louis Köhler's Latest Revision) by Robert S. Goldbeck.

No. 59. CZERNY. Op. 299. School of Velocity. Complete 60
Revised, fingered and annotated by Thos. a'Becket.

No. 58. DUVERNOY. Op. 120. School of Mechanism. Fifteen Primary Studies in Velocity 50
Revised, fingered and annotated by Thos. a'Becket.

No. 70. FINK. Op. 295. Rural Pictures. Twelve Easy, Melodious and Instructive Pieces for the Pianoforte 60
Revised, fingered and annotated by Thos. a'Becket.

No. 27. GURLITT. Op. 117. The First Lessons. Thirty-four Little Melodies for the Pianoforte 50
Revised, fingered and annotated by Jaroslaw de Zielinski.

No. 22. HELLER. Op. 46. Thirty Progressive Studies for the Pianoforte 1 00
Revised and annotated by W. S. B. Mathews.

No. 23. HELLER. Op. 47. Twenty-five Studies for the Pianoforte 1 00
Revised and annotated by W. S. B. Mathews.

No. 33. KÖHLER. Op. 50. First Studies for the Pianoforte 50
Revised, fingered and annotated by W. S. B. Mathews.

No. 30. KÖHLER. Op. 190. Very Easiest Studies for the Pianoforte 50
Revised, fingered and annotated by W. S. B. Mathews.

No. 1. KÖHLER. Op. 249. Practical Method for the Pianoforte. Vol. I 75
Revised, fingered and annotated by Thos. a'Becket.

No. 2. KÖHLER. Op. 249. Practical Method for the Pianoforte. Vol. 2 75
Revised, fingered and annotated by Thos. a'Becket.

No. 3. KÖHLER. Op. 249. Practical Method for the Pianoforte. Vol. 3 75
Revised, fingered and annotated by Thos. a'Becket.

No. 41. KUHLAU. Sonatinas for the Pianoforte. Vol. 1 50
Edited and annotated (after Louis Köhler's Latest Revision) by J. S. Van Cleve.

No. 42. KUHLAU. Sonatinas for the Pianoforte. Vol. 2 50
Edited and annotated (after Louis Köhler's Latest Revision) by J. S. Van Cleve.

No. 52. KUHNER. Etude School. A Model Collection of Well Graded Piano Studies. Vol. 1. Lower Elementary Grade 75

No. 46. LE COUPPEY. Op. 26. Fifteen Studies in Mechanism—Preface to Czerny's Studies in Velocity 1 00
Revised, fingered and annotated by Jaroslaw de Zielinski.

No. 8. LEMOINE. Op. 37. Etudes Enfantines for the Pianoforte 60
Revised, fingered and annotated by Wilson G. Smith.

No. 37. LÖSCHHORN. Op. 65. Studies for the Development of Technique and Expression. Book I 50
Revised, fingered and annotated by Jaroslaw de Zielinski.

No. 11. MENDELSSOHN. Songs Without Words for the Pianoforte 1 00
Edited and annotated (after Theo. Kullak's Latest Revision) by Jaroslaw de Zielinski.

No. 69. REINHOLD. Op. 39. Miniature Pictures. Twenty-four Easy Little Pieces for the Pianoforte 60
Revised, fingered and annotated by Thos. a'Becket.

No. 65. SCHMITT. Op. 16. Preparatory Five-Finger Exercises 25
Revised and annotated by Thos. a'Becket.

No. 15. SONATINA ALBUM for the Pianoforte 75
Edited and annotated (after Louis Köhler's Latest Revision) by W. S. B. Mathews.

No. 12. STREABBOG. Op. 63. Twelve Etudes Melodiques 75
Revised, fingered and annotated by Wilson G. Smith.

GRADE 1.

The Corner Stone of the Course.

Table Exercises; Instructions from the Very Beginning, Most Carefully Graded; Difficulties Introduced in Logical Order; Interesting Exercises and Etudes; No Octaves; Exercises for Free Wrist; Major Scales—*Written*, but *not* Played.

GRADE 2.

Introduction of Scale Playing; Exercises for Passing Under the Thumb; Minor Scales Written; Beginning of Arpeggio Work (Broken Chords); Major and Minor Chords Awakening of the Ideal of the Singing Touch; Interesting Etudes; Careful Grading of Difficulties.

The Preparatory Gymnastic Exercises, in Grade 1, are Practical and Helpful.

GRADE 3.

Velocity Assumes Some Importance; Attention Given to the Staccato, while Cantabile Playing Is Carried Aloug with Equal Care; Etudes Become More Like Pieces; Polyphonic Playing Introduced; Exercises for Weak Fingers in Each Hand.

GRADE 4.

Polyphonic Playing Carried Forward; Rhythmical Problems (Two Against Three) Introduced; Greater Richness in the Etudes; Etudes for Melody Playing, Rapid Runs, Trills, Arpeggi, Marked Rhythms, Extreme Agility, Fourth and Fifth Fingers Interest Maintained Throughout the Grade.

GRADE 5.

Musical Material of Great Beauty; Etudes for Left Hand, Octaves, Polyphonic Playing, Staccato, Double Notes, Grand Arpeggi, Fourth and Fifth Fingers. In Singing Tone, Touch, Velocity and General Intelligence, Much More is Demanded of the Pupil.

GRADE 6.

Etudes for Extended Finger Touches, Staccato, Doubl Notes, Extreme Rapidity in Staccato and Runs; More Attention Given to Octaves; Pupil's Task Steadily Increasing in Difficulty—Greater Requirements in Regard to Touch, Interpretation, Color and Phrasing.

GRADE 7.

Pieces and Etudes by Saint-Saëns, Henselt, Kullak, Chopin, Mendelssohn, Raff, Alkan and others. These, Making Greater Demands upon the Pupil, advance his Technical Skill to the Highest Efficiency and Insure Ability to Interpret the Greatest Works for the Piano.

Several Opinions.

WILLIAM H. SHERWOOD: I am happy to state that the "National Graded Course" is remarkably adapted to the needs of teachers and students of music. Your claim in regard to the excellent grading of the studies is a thoroughly just one. I do not think that I have ever seen as good a succession of topics and exercises arranged as they are from the beginning on, using the best kind of materials from all sources and without any superfluous pages.

WILSON G. SMITH: I have been particularly impressed with the practical value and uniform excellence of the "National Graded Course."

AD. M. FOERSTER: The "National Graded Course" is destined to hold a foremost position among the works of its class. I do not know of a better work, one containing a more interesting and valuable selection of studies and pieces for the various peculiarities to be mastered. A list of desirable pieces that may be added to each part, if found necessary, is given in each grade, also definitions of all musical terms used in the work. The work is bound to find favor with thoughtful teachers and students.

O. R. SKINNER: I like the "National Graded Course" much better than any other work I am familiar with. The editing seems to be thoroughly well done, and the print leaves nothing to be desired.

(Want of space alone prevents printing the opinions of hundreds of well-kuown teachers in all sections of the United States and Canada.)

It Will Help YOU in Your Teaching.

Because

- It embodies the work of the most eminent pianists and teachers in America.
- It can be readily adapted to your "method," no matter what that may be.
- It is the LATEST work of the kind.
- ALL of the studies are carefully annotated, fingered and edited.
- It is the most carefully graded of any course before the public.
- It begins at the beginning of study.
- It saves the time that otherwise would be spent in laborious and often unrewarded search after that which is good and up-to-date.
- It covers the entire field of piano literature in an eminently practical, interesting and stimulating manner.
- Hundreds of your fellow teachers from all parts of the country have sent us, unsolicited, enthusiastic commendations of these very features.

This complete work (7 grades) together with a specially prepared pamphlet entitled: "Hints for Obtaining the Best Results in Using the National Graded Course," will be sent upon request, subject to examination and approval—without any obligation to purchase.

BEHR, F.

Op. 503, No. 30. Au Revoir (Auf Wiedersehn) 20
A tender little melody, which sings out its good-bye hopefully. Requires a loose, quiet wrist and singing legato finger touch.

Op. 508, No. 18. Bird's Message (Vögleins Botschaft) 20
This makes somewhat greater demands on the player. Its bird imitation makes use of the added lines, which must be read quickly. A light wrist and flexible fingers are needed.

Op. 426, No. 1. Congratulation (Glückwunsch) 20
These congratulations are hearty and the piece should be played stirdily, but with no tendency toward hardness of touch. It is a useful teaching piece.

Ethel Polka 20
A sprightly little dance, bright in melody and easy in accompaniment. A good study in wrist touch and staccato.

Op. 575, No. 23. Farewell to Home (Abschied von der Heimath) 20
Somewhat similar in nature to Au Revoir, but more difficult. It is very pretty and sure to please the pupil.

Op. 575, No. 1. French Child's Song (Französisches Kinderliedchen) 20
A quite easy first piece with a good tune to it. It is entirely in position.

Grandpapa's Dance (Grossvater's Tänzchen) 20
Grandpapa must be a jolly old fellow, for his dance is quite gay. Another good exercise in wrist staccato.

Op. 575, No. 2. In the Month of May (Im Mai) 20
A song of spring, bright and tuneful. It is a good first piece.

Op. 426, No. 5. Italian Song (Italienisches Lied) 20
This requires more musical perception from the pupil and, given at proper time, will be a good study in phrasing. The reiterated chords in left hand must be watched.

Kindergarten Waltz 20
A very graceful waltz, not hard to play, but pleasing. Should be carefully phrased.

Night in May (Mainacht) 20
This is a splendid piece for teaching purposes. It is clear in form, interesting in treatment and attractive in melody and harmony.

Night Patrol (Nächtliche Runde) 20
A good staccato is demanded in this piece. Its martial character is pronounced. Bright and interesting.

Parade of the Guard (Wachtparade) 20
Somewhat similar to the preceding, but more lively. Partakes more of the character of the two-step. We can easily imagine the guard swinging by at double quick.

Op. 426, No. 3. Star Greeting (Sternengruss) 20
Of quite different style. Phrases are well marked and a smooth, singing legato is necessary in both hands.

BIEHL, A.

Op. 53, No. 2. Dance on the Lawn (Tänzchen im Freien) 20
This dance shows the frisky disposition of the dancers. It is not difficult, but pleasing.

Op. 52, No 14. The Clock (Die Wanduhr) 20
Very characteristic. The left hand adds much to the effect and should be well played.

Op. 53, No. 7. Garland Weaving (Beim Kränzewinden) 20
A beautiful little piece. The second part makes some demands upon the left hand. Well worth study.

Op. 52, No. 15. Little Soldiers' March (Kleiner Soldaten Marsch) 20
An attractive study in chord playing in left hand, with a good tune in the right. Not hard, but pleasing.

Op. 52, No. 10 Picnic Dance 20
Exemplifies its name. A jolly dance, such as happy picnicers would indulge in. Good teaching piece.

Op. 53, No 1. Wild Rider (Der Wilde Reiter) 20
A good descriptive piece, requiring firm tone and light wrists and arms. Good study.

BOLCK, O.

Op 68, No. 1. Weaving Garlands (Beim Kränzewinden) 20
A very tuneful melody with broken chord accompaniment. Attractive without undue difficulty.

ENGELMANN, H.

Op. 408 No. 4. Humpty Dumpty Schottische 25
A brisk Schottische. Like all of Engelmann's pieces, it is full of melody and interestingly harmonized.

Op. 422, No. 3 King's Delight Mazurka 25
A characteristic Mazurka by same author. Good practice in phrasing. Not difficult.

Op. 408, No. 5. Little Boy Blue March 25
A good march. Excellent practice in wrist touch. Sure to please.

Op. 408, No. 1. Mother Hubbard Waltz 25
A graceful waltz, no hard places to discourage the young player.

Op. 422, No. 5. Old King Cole's March 25
A bright piece, good for teaching purposes and sure to interest the pupil.

Op. 422, No. 1. Start Up Waltz 25
Sure to start the pupil to practicing it with vigor. It is easy, bright and jolly.

GOERDELER, R.

Lullaby 25
A beautiful melody which gives opportunity for cultivating a singing tone. Very attractive.

Merry-Go-Round 25
A joyous little piece. Phrases are well defined, and will aid the pupil in understanding simple form.

Sweet Evelyn Waltz 25
An attractive little waltz of no particular difficulty. Melody of first part is in left hand. Effect of tic is good.

GURLITT, C.

Op. 130, No. 6. March of the Tin Soldiers (Zinnsoldaten Marsch) 20
Melody is given out by right hand and is then repeated in left. In six-eight measure. Very good.

HELLER, M. P.

Op. 6, No 3. On the Playground (Auf dem Spielplatz) 20
A good study piece. The slurs give practice in lifting hand after binding two notes. A contrasted legato melody in second part should be carefully played.

HILLER, P.

Op. 66, No. 2. Grandmother's Dream 20
An excellent study piece. Its subjects are well contrasted and the work is evenly distributed.

Op. 66, No. 3 Lonely Rose 20
In the minor. The loneliness of the flower is told quite well. A singing legato and a chance for expression are its distinguishing features.

KÖHLER, L.

Op. 210, No. 4. At Home (Am Gemüthlichen Plätzchen) 20
Quiet contentment characterizes this little piece.

KÜGELE, R.

Doll's Dance (Puppentanz) 20
There must be lively dolls, for this dance is full of go. Besides being a good teaching piece, it is sure to please.

LANGE, G.

Op. 249, No. 1. In Rank and File 35
Erect and vigorous these soldiers march by. Occasionally the roll of the drum is heard. Not difficult.

LICHNER, H.

Op. 78, No. 4. First Ball. Rondino 35
Some good finger work can be gotten from this piece, which is tuneful and gay. A crisp staccato is necessary also.

Op. 57, No. 3. Twinkling Feet Waltz 20
Simple and free from catchy places, this waltz is nevertheless very attractive. If played daintily, it is very characteristic.

MERKEL, G.

Op. 31, No. 1. Children's March (Kindermarsch) 20
Short, but it is full of music. It should be played with decision.

PRIDHAM, J.

Fairies' Waltz 30
Its two subjects require somewhat different treatment. The first, a quiet hand and firm finger touch. The second, a light wrist touch changing to a finger touch for the runs. Very bright and pleasing.

REINECKE, C.

Op. 107, No. 12. Children and Cuckoo (Kinder und Kukuk) 20
The children's song and the call of the cuckoo are heard here. The children at times break off their song to imitate the bird. Instructive as well as pleasing.

RUMMEL, J.

March 20
A good example of this form. Bright and effective.

SARTORIO, A.

Op. 229, No. 7. Dreams of Youth (Jugendträume).. Polka Mazurka 20
Good practice in dotted-eighth and sixteenth rhythm, and in double notes. Tuneful and without hard places.

Op. 229, No. 2. Italian Song (Italienisches Liedchen) Barcarolle 20
A singing melody with a broken chord accompaniment. Excellent practice in phrasing.

Op. 229, No. 3. Military March (Militair Marsch) 20
A good march somewhat more difficult than those before mentioned. Well controlled arms and hands are needed. Results will be good.

SCHUMANN, R.

Op. 68, No. 10. Happy Peasant (Fröhlicher Landmann) 20
Too well known to need comment. With it is a Hunting Song, which is an excellent companion.

THOMÉ, F.

Melodie 20
A very beautiful piece. Its exquisite melody should be played with a full singing legato. The first bass note of each measure is staccato, making a peculiarly effective accompaniment.

WOLFF, G. T.

Op. 25, No. 11. Mill by the Brook (Mühle am Bache) 20
Brisk and characteristic. The clatter of the mill is given first with the right, then with the left hand.

WOOLER, A.

Golden Sunset 25
Especially useful for the running work in left hand. Very pleasing.

Published by **HATCH MUSIC COMPANY**, Philadelphia.

CHOICE NUMBERS

FROM THE

"Hatch Edition"

Diminished reproduction of cover plate used on the "Hatch Edition."

All numbers included in this list have been carefully edited and annotated by leading American teachers, our corps of editors including: W. S. B. Mathews, Wm. H Sherwood, Frank H. Tubbs, Frederic W. Root, R. S. Goldbeck, Jaroslaw de Zielinski, J. S. Van Cleve, Thos. a'Becket, Wilson G. Smith, H. C. Macdougall, Bernhard Listemann, etc. This important work has never been attempted by any other publisher. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Regardless of the additional expense involved in the publication of annotated editions, prices have not been advanced, but are the same as those charged for ordinary reprints of the works included in this list.

No. 28. BURGMÜLLER. Op. 100. Twenty-five Easy Studies for the Pianoforte 1 00
Revised, fingered and annotated by Jaroslaw de Zielinski.

No. 29. CHOPIN. Nocturnes for the Pianoforte 75
Revised and fingered by Carl Mikuli.

Edited and annotated (after Louis Köhler's Latest Revision) by W. S. B. Mathews.

No. 12. STREABBOG. Op. 63. Twelve Etudes Melodiques 75
Revised, fingered and annotated by Wilson G. Smith.

SEND FOR COMPLETE LIST.

Music Publishing.

(WRITE US FOR DETAILED INFORMATION.)

We have every facility for the prompt and satisfactory publication of any musical work—no matter whether it is a piece of sheet music or a large book. Our facilities are unsurpassed and there is no kind or style of work in our line which we cannot do in the very best manner at the least possible cost. We make an engraved sheet music plate (8 x 11—piano, or voice and piano) for $1.50. This quotation is for high-class work. We make engraved plate titles costing from $4.00 to $12.50, depending entirely upon the amount of work put upon the plate. Our $4.00 title is very much superior to the majority of titles used on sheet music, and unless the author desires an elaborate page, this will give excellent satisfaction. When a higher priced (more elaborate) title is desired, is is only necessary to name the limit. We will give all the work that the amount named will pay for. We make all kinds of illustrated titles, including crayon drawings, reproductions of line drawings, half-tone reproductions, combinations of line drawing reproductions and half-tones, combinations of half-tones and electrotypes, but as the cost of these titles depends upon the expense of design and amount of work, it is impossible to make an intelligent or complete price-list. If sample, showing style desired, and full description is sent us, we will make and submit complete estimate. Combinations (reproductions of pen drawing and half-tone or electrotype and half-tone, printed in colors) are very generally used on popular issues of the day, while standard works, and those designed principally for teaching purposes, are usually issued with engraved plate titles.

Our printing is all that could be desired by the most critical and is equal, in every respect to the finest European press-work.

Sheet Music. Below we print a convenient price-list showing cost of publishing sheet music with engraved plate titles. This list is based upon a $4.00 title, but if a more elaborate page is desired, the total cost can readily be arrived at by adding the additional amount.

PIECE WITH THREE PLATES AND TITLE.

250 COPIES.		500 COPIES.	
3 plates and engraving @ $1.50	$ 4 50	3 plates and engraving @ $1.50	$ 4 50
Plate and engraving of title	4 00	Plate and engraving of title	4 00
16½ quires best music paper	2 27	33 quires (1 13-20 reams) best music paper	4 54
Printing 250 copies	2 93	Printing 500 copies	4 69
Folding 250 copies	10	Folding 500 copies	19
	$13 80		$17 92
Each succeeding edition of 250 copies, $5.30.		Each succeeding edition of 500 copies, $9.42.	

For a Piece with Four Plates and Title, add $1.50—cost of extra music plate.

PIECE WITH FIVE PLATES AND TITLE.

250 COPIES.		500 COPIES.	
5 plates and engraving @ $1.50	$7 50	5 plates and engraving @ $1.50	$ 7 50
Plate and engraving of title	4 00	Plate and engraving of title	4 00
22 quires (1 2-20 reams) best music paper	3 03	44 quires (2 4-20 reams) best music paper	6 05
Printing 250 copies	3 90	Printing 500 copies	6 25
Folding 250 copies	16	Folding 500 copies	32
	$18 59		$24 12
Each succeeding edition of 250 copies, $7.09.		Each succeeding edition of 500 copies, $12.62.	

For a Piece with Six Plates and Title, add $1.50—cost of extra music plate.

NOTE.—Upon application, estimates will be furnished for pieces with greater number of plates; also for larger editions than 500 copies.

Orchestra Music—Band Music. As the instrumentation for orchestra and band publications varies, it is hardly possible to make a list which will cover this class of work. Upon receipt of manuscript and full instructions, we will make up and submit complete estimate for plates and any number of copies desired.

Music Books. We are prepared to do all kinds of music book work. Upon receipt of copy and full instructions (sample book, showing the style of work desired, quality of paper, style of binding, etc., will be of great assistance in illustrating just what is wanted), we will make up and submit complete estimate for plates and any number of copies desired.

Copyrights. When requested to do so, we attend to entering copyrights. It is highly important that this matter should have prompt and intelligent attention. For each entry, including certificate, we charge $2.00—$1.00 for entry; the balance ($1.00) covers our fee and expenses. For entry, without certificate (certificate can be obtained at any future time upon payment of an additional 50 cents), we charge $1.50—50 cents for entry; the balance ($1.00) covers our fee and expenses.

Hatch Music Company's
LATEST PUBLICATIONS.

PIANO SOLOS.

Allen, A. Gavotte. Grade II, ... 25
Graceful and dainty movement.

Allen, A. In Merry Mood. Grade II, . . 25
In somewhat of a military vein; a jolly movement.

Allen, A. In the Night. Grade II, ... 25
Soft and tranquil study of small chords.

Allen, A. Melody. Grade II, ... 25
Theme principally in quarter and half notes, with flowing bass in eighths.

Allen, A. Organ (The) Man Plays. Grade II, ... 25
Odd little *scherzando*, brimful of interest.

Allen, A. Will o' the Wisp. Grade II, . 25
Nimble caprice, for which both hands must be alert.

Horváth, G. Op. 21, No. 6. Petite Polka. Grade II, ... 25
Rapid and brilliant, and extremely showy.

Horváth, G. Op. 21, No. 3. Polka. Grade II. 25
Nimble and sprightly little movement.

Horváth, G. Op. 21, No. 4. Schottische. Grade II, ... 25
Charmingly attractive theme and movement.

Horváth, G. Op. 21, No. 2. Waltz. Grade II, ... 25
Flowing *legato* melody; graceful and easy to play.

Kienzl, W. Op. 51, No. 5. Carnival Mazurka. Grade III, ... 35
Not so difficult, but requires nice, neat execution.

Kienzl, W. Op. 51, No. 4. Carnival Polka. Grade III, ... 30
Chirpy and bright; requires good wrist to play it well.

Kienzl, W. Op. 51, No. 6. Carnival Waltz. Grade IV, ... 40
Exceedingly brilliant concert solo.

Peacock, W. Spring's Awakening. Polka Brillante. Grade III, ... 40
Extremely showy and "catchy" solo.

Scheel, G. Op. 46, No. 2. Bird (A) in the Wood (Vöglein im Walde). Grade I, 25
Quiet finger movement in which each hand participates.

Scheel, G. Op. 46, No. 3. In the Boat (Im Kahn). Grade I, ... 25
The left hand sometimes has the melody in this little *barcarolle*.

Scheel, G. Op. 46, No. 1. Merry Dance (Lustiger Reigen). Grade I, ... 25
Pretty sketch; lies well under the hand.

Scheel, G. Op. 46, No. 4. Spring Song (Frühlingslied). Grade II. 25
Bright study of double notes; pleasing and full of interest.

Sudds, W. F. Op. 269. Red Fez Parade. March. Grade III, ... 40
Descriptive of gradual approach; very pleasing and striking.

Sudds, W. F. Op. 271. When Night Has Come. Meditation. Grade III, . . . 35
Beautiful subject, principally in the left hand. Excellent solo of quiet character.

Székely, I. Harvest Home (Kirchweihfest). Grade IV, ... 25
Interlocking and crossing of hands is the principal feature of this interesting composition.

Székely, I. Little Marie (Mariechen). Grade III, ... 25
Pretty effect with appogiaturas crossing over the right hand.

Székely, I. Miller's Song (Müllerliedchen). Grade III, ... 25
The clack of the mill gives fine practice to the thumb and little finger.

Székely, I. Rural Greeting (Ländlicher Gruss). Grade III, ... 25
Left hand has much of the melody, accompanied by brilliant runs.

Székely, I. Shepherd's Song (Hüterlied). Grade III, ... 25
Peculiar and interesting finger passages accompany the song.

Székely, I. Song of the Wanderer (Wanderlied). Grade IV, ... 25
Melody with unique *tremolando* accompaniment.

Székely, I. Sweet Secret (Süsses Geheimniss). Grade II, ... 25
Crossed hands are used with nice effects.

Székely, I. Wedding Dance (Hochzeitstanz). Grade II, ... 25
Joyous and inspiriting, with peculiar Hungarian flavor.

Without Octaves

We have recently issued under the above heading the following series of excellent piano pieces, containing octaves only in broken form if at all. They are of various grades of difficulty and are carefully revised, edited and fingered.

Foerster, A. Schumann, R. Op. 124, No. 6.	Nocturne (Go to Sleep Fairies) Cradle Song	25
Reinecke, Carl Foerster, A.	Dragonfly in the Sunshine The First Snowflakes	25
Hollaender, A.	Birds in the Woods	25
Foerster, A. Oldberg, A.	Flitting Butterflies The Garden Mole	25
Foerster, A. Gurlitt, C.	The Flower Fairies The Rabbit	25
Reinecke, C. Oldberg, A.	The Rain Fairies The Cricket	25
Karganoff, G. Op. 25, No. 5.	The Brook	40
Karganoff, G. Reinecke, C.	Nature's Dream A Dream	25
Gayrhos, E. Reinhold, H.	Spring's Awakening The Gnomes	25
Foerster, A. Foerster, A.	Under the Linden Tree Upon the Meadow	25
Gayrhos, E.	The Reapers	25
Elmenreich, A.	Spinning Song	25
Hollaender, A. Seeboeck, W.C.E.	In Dolly's Kitchen The Shepherd	25
Reinhold, H. Reinecke, C.	Boat Song Hurdy-Gurdy	25
Gurlitt, C. Op. 101, No. 2 Behr, F.	Morning Prayer Night's Song	25

We have just published for the piano

By Mrs. Regina Watson

Scherzino	50
Mazourka Etude	75
An Arabian Night	60

These have been played by Mme. Carreno on her recent tour in America.

Also by Pearle M. Ball

Minuetto from Suite, Op. 7	50
The Dance of the Dryads	40

Two pianoforte compositions of good quality and character, about 4th grade of difficulty.

All the above will be sent on approval.

DO YOU REALIZE

the helpful work we are doing in the matter of examining with great care all new musical publications from which we select only the best and most interesting and list them in *The Music Review*, giving a description of their character, grade of difficulty, etc.

The Music Review

is published monthly, excepting July and August, at a sub criptionprice of 50c. a year.

Consider how valuable to the teacher of music such a catalogue will become as a book of reference.

Modern Foundation Studies
—In—
Piano Playing
Graded for Beginners.

By W. F. SUDDS.

The great progress made in the art of piano playing during the past few years has, to a large extent, rendered older books of instruction obsolete. All good works contain the proper material, but its arrangement, and the method of presenting it to the immature musical mind, often leaves much to be desired. Improvement of these particular features—the arrangement and method—has been the guiding thought in the preparation of "Modern Foundation Studies."

It is a work for beginners, and matters of vital importance, such as formation of the hand, methods of touch and tone-production, are treated in detail. In addition to the comprehensive treatment of these subjects and numerous musical examples, exact positions and movement of the hands in the proper performance of the various touches are profusely illustrated. This feature will be appreciated by teachers.

The work contains foundation material on which the most elaborate superstructure may be safely built. The music has been selected with great care, to clearly illustrate the point under consideration in an attractive manner, without wearying the student.

Paper Binding. Price, $1.00.

Guide to Practical Musicianship
For Students of Piano, Organ or Violin.

By A. J. GOODRICH.

In his new system, the author does away with the old and slavish process of rote memorizing, *i. e.*, playing notes and repeating them until memorized, without attempting to master the composer's design; and he illustrates the means by which intelligent students may, in a comparatively short time, master any composition that does not present technical difficulties beyond their conception.

The results are three-fold: (1) A great economy of time; (2) An intelligent understanding of compositions; (3) An improved memory.

Professional musicians, practical teachers, amateur musicians and students of music have long felt the need of some improved method that would reduce the time required to memorize a composition, and Mr. Goodrich presents a method that he subjected to a thorough and exhaustive test, with eminently satisfactory results, before putting his ideas in shape for publication. It is the author's firm belief that, by its aid, compositions may be mastered in from one-quarter to one-half the time required by old systems.

Every musician needs a copy of "Goodrich's Guide to Practical Musicianship."

Paper Binding. Price, $1.00.

HATCH EDITION No. 72. Eighteen Melodious Studies in Easy Style. Max Paul Heller, Op. 10. Revised, Fingered and Annotated by Thos. a'Becket . . Paper 50c
An extremely valuable collection of first grade studies in the form of phrasing pieces.

HATCH EDITION No. 73. The Children's Corner. Ten Easy Pieces. E. Hasse, Op. 52. Revised, Fingered and Annotated by Thos. a'Becket . . . . . Paper 50c
An interesting and useful collection of music for pupils in the second grade.

THIS SYSTEM IS COVERED BY COPYRIGHT.

MUSICAL KINDERGARTEN FOR THE PIANOFORTE

ASSOCIATE TEACHERS
MRS. GRACE YEAGER,
MISS KATHERINE SCHUSTER.

By FANNIE CHURCH PARSONS.

This system is most simple in outline and material.
It is most comprehensive and complete.
It is essentially a tone system teaching the children how to write music "by ear."
The materials used are, while very durable, most suggestive of the beauty of the art of music.
The lessons are equally instructive to either child or adult beginner.
The students do much real piano work, thus no intermediate course is necessary.
The stories and songs do not savor of the grotesque, but tend to refinement and culture.
The price for normal work, including materials, is within the reach of all.
You can take the work by mail, or of a normal instructor, or of Mrs. Parsons personally.

Correspondence should be addressed to **Musical Kindergarten Company,**
Office, 6 W. Chicago St., Quincy, Mich.

STUDIO, 510 HANDEL HALL, CHICAGO, ILL.

AWAKENING.

When the year has found its freedom from the bondage of the frost,
And the memories of winter in a tide of life are lost,
Then the heart awakes to answer Nature's impulse and rejoice
If we know her hidden meanings and the music of her voice.

Oh, the pulsing warmth of waking, how it permeates the air—
'Tis the anodyne of hope that steals the bitterness from care.
We may lay aside our burdens in the glory of our choice
If we win the heart of Nature and will hearken to her voice.

—*Albert Bigelow Paine.*

THE TOWN CHORUS AND THE SINGING SCHOOL.

W. FRANCIS GATES.

The community in which those who can sing band themselves together for instruction and mutual help and enjoyment, secure a competent leader, buy good music, sing it to the best of their ability, and do this for five or ten years continuously, is sure to be found more enlightened in musical things, more progressive in general education, broader in its views of life, happier in its home, more contented in its work, more bound together in a healthy spirit of help and progress than its neighbor that knows no such effort in art matters, musical or otherwise.

Such a chorus that I speak of brings together, musically and socially, young people of some degree of congeniality; it sets them to work at a common end and with means that all hold in common to a greater or less degree; it is a relief both to the tedium of the daily employments of the busy and of the inanities of the idle; it is a factor in the betterment of both the mental and physical life; and, more than this, it is a practical focalization of the artistic elements of a community toward the best combined results—elements that otherwise would be scattered and inefficient.

For these reasons it is greatly to be deplored that the old-fashioned "singing school" is largely a thing of the past. In some communities it is true that a more advanced state of musical culture has taken the place of this means of musical study. But in far more it has been suffered to die out through a lack of interest in music and nothing better could, in the nature of things, take its place. For it was a stepping-stone to better musical progress.

Fifty and sixty years ago the singing school was a feature of every Eastern town that took any pride in its standing among its neighbors. Thirty years ago it was a feature of the social life of the Middle States in the smaller cities and the towns. To-day I know some communities in the Northwest States, where the young people enjoy their weekly sing, but in California, I think, there is less interest taken in the rudimentary study. If the singing school came to a lingering death in its journey across the plains and never gained acclimatization on "the coast," it to be regretted, for it had in it at least the elements of the good that is a product of the town chorus. And the singing school was, in its day, almost the only expression in its community of any artistic impulse. In many a town and township there is absolutely no possibility for the outlet of any artistic feeling that may perchance wander into the make-up of the young man or maiden.

The singing school taught the youngsters to sing—after a fashion. But that fashion was infinitely better than not to sing at all. It paved the way for an interest in better singing, better music. The "do-re-me"-ing finally brought the family pocket-book to the point of buying a cheap organ; that in time led to a better; eventually a piano became a necessity; then, of course, there must be a teacher; and then followed a trip to the nearest city for better musical instruction; there concerts and recitals broadened the musical horizon; and when the young lady (of course, the boys had to stay home and work the farm) returned to her home she radiated more or less of her musical culture, and the whole neighborhood was the gainer.

These were the natural steps in musical progress in many a family and the results were, and are, to-day, being felt throughout whole communities. Remember that the rural pupil is to become a missionary sowing seed on fertile soil and give her the best that is in you, not slighting the perhaps awkward or backward young damsel from the country, as may be the tendency of some teachers.

In the cities the place of the singing school has been taken by the musical education given in the public schools, scant and faulty though that may be, this being not so much the fault of the school music teachers as of the niggardly appropriations therefor. In some cases the church does something for the musical education of its young people, but this is not a great factor in the matter. Often for adults there is the secular or the church chorus, these being based on the individul study that has been the opportunity of those living in the cities. So the singing class is not often found in the city.

Nearly every college, however, offers some advantages in this line at a nominal fee, but while this offer appears well on paper, comparatively a few students avail themselves of it. In a college, enrolling 200 to 500 students, there seldom is a music reading class of over twenty persons, and in many a school of 500 students it is only by the hardest work ou the part of the teacher that a college chorus is maintained. The State institutions are generally the largest, but they are the ones in which there is the least interest in music.

It is a great pity that in the smaller cities and towns the singing class has been relegated to a state of desuetude and no substitute provided. The result is, that while among the young people of two generations ago there were many apt and ready readers of music, the proportion of such, to-day, is small.

For these reasons the town that has sufficient interest in good music to support an active and progressive chorus is surely to be congratulated; for by that fact, if by no other, it proves that the artistic and progressive spirit is alive. The results of such an organization, as I have said above, will be an enlargement of the mental and musical horizon, the development of latent talent that otherwise might be ineffectual, and the fostering in the community of a love for one form of the beautiful, leading to a more general musical culture.

If I might add to the above an example, a concrete instance, I would cite a town in Southern California that I recently visited. This place of some fifteen hundred inhabitants, nestled at the foot of the Sierra Madre Mountains, with its hundred of acres of golden oranges, has a little chorus of forty voices. This band of singers, of course, with the changes that time produces, has kept together for some ten or fifteen years, I was told, always securing from the neighboring city a good conductor and singing good music. It ought not to have been a surprise, then, to have heard some excellent chorus work, but it was in a place of that size. This society secured soloists, an orchestra of thirty pieces, and when the train schedule was not accommodating, simply ordered a special train for the accommodation of these and others.

Now what brought all this about? Not great wealth. A "killing frost" to-morrow would rob nearly all of these people of their yearly income. No; it was interest in music, pride in their club, town pride. And all these had their rise and growth in the years of enjoyable meetings together after the day's work on the ranch and in the orange grove was over. Is it any wonder that in the audience gathered to hear this program there was visible the same culture, good looks, tasteful dress and musical interest that one would expect in a large and musical city? In such a case it would be hard to separate cause and effect. The good sense and good taste of the people kept the society alive, and the organization, in its turn, reflected its gathered culture on the whole community and gives the town a good name in all that part of the country.

And what has been done in that little sun-kissed town away out on the Pacific slope, almost in sight of the rolling ocean, might be accomplished in very many places all over the country. It only needs a nucleus of interested and energetic spirits, self-sacrificing and progressive.

THE PERSONALITY OF JOSEF HOFMANN.

The New York *Sun* gratifies public curiosity in regard to the famous pianist, Hofmann, with these personal details: Josef Hofmann is as much of a mass of muscle as if he were a champion strong man, and not merely a pianist. This is quite as much a natural gift as his musical powers, and he makes no attempt to retain his strength by exercise. Since his return to Europe from this country, three years ago, he has given 150 concerts in Russia. He has played 13 times each year in St. Petersburg, and has visited all the Russian cities, traveling even to Tiflis, in the Caucasus, a journey that few musicians undertake because the trip thither and back to Moscow occupies more than two weeks. He is established to day in Russia as the most popular pianist heard since Rubinstein, whose place he has filled. He plays more frequently than Rubinstein, because there is to-day a larger musical public in St. Petersburg, and it is possible to give concerts more frequently now than it was 10 years ago. Hofmann is also about the best-liked pianist in certain German cities, although he has played there less frequently than in Russia. He speaks English fluently, although not idiomatically always, and his manner is as boyish and modest as it was when he came here first. In this respect he resembles most the Josef of his first visit. He is compelled to sacrifice as much enjoyment for his art as if he were a prima donna or a tenor. He was to play at a private concert the other night before an audience not likely to be in the slightest degree critical or exacting. But he was as nervous as if he were about to face an important audience. Before he is to play he eats very little, and takes no stimulant of any kind.

In the biography of Joachim, by Andreas Moser, lately translated into English for the first time, there is this anecdote of the great violinist:

At an evening party given by Mendelssohn, the host had played the Kreutzer sonata with Joachim. After the music there was an informal supper party. Joachim sat at the table with Schumann; it was summer time, and the starlit sky was visible through the open-wide window. Schumann, who had long remained silent, presently laid his hand gently on the knee of his little neighbor, and pointing heavenwards, gently said: "I wonder whether beings exist up there who know how beautifully a little boy here below has just played the Kreutzer sonata with Mendelssohn?"

Only women understand children thoroughly; but if a mere man keeps very quiet, or humbles himself properly, and refrains from talking down to his superiors, the children will sometimes be good to him and let him see what they think about the world.—*Rudyard Kipling.*

THE Teachers' Forum

Conducted by N. J. COREY

This department is inaugurated for the purpose of uniting the many teachers who read THE MUSICIAN in a bond of professional brotherhood. It is to be their medium for the interchange of ideas, experiences, encouragement, discouragement and difficulties. The fullest correspondence is invited. The questions will be answered and suggestions given by the conductor and the contributions of those who wish to gain new light or to present their methods will be printed. We propose helping ever teacher who will permit us to do so; we intend to do everything possible to overcome the isolation with which you are burdened. Will you co-operate with us?

No conditions are attached: the department is open to *all* MUSICIAN subscribers. Address all communications to the Teachers' Forum, care THE MUSICIAN, Eighth and Locust Streets, Philadelphia, Pa. Do not hesitate, but be among the first to ask help, or to give some other teacher a suggestion. Let us know what you would like to have treated in its columns.—Editor of THE MUSICIAN.

"The gates of art are closed unto none; who so entereth thereat, though he seeketh perfection, yet shall he not find it."
—Ancient Egyptian Papyrus, 3580 B. C.

ABOUT FUNDAMENTAL TRAINING.

It seems expedient to me, just here and now, to put aside both questions and answers for the moment, and to treat in the present issue, of a topic which I believe vital to musical development in America. As I go on in my profession, teaching and learning, I am more and more impressed with the great need of what I may style primary training for pupils. Nothing is more common than imperfect, even slovenly, work, on the part of beginners. Nothing more common than the erroneous belief that any sort of teacher is quite good enough for beginners. Now the real facts of the case are, that upon the proper laying of foundations, the whole superstructure absolutely depends. No amount of ornamentation will prevent a building from falling unless it is solidly grounded. The first teacher gives a child not only mental bias and emotional enthusiasm, but technical principles which make or mar farther accomplishment. The work of a beginner determines, more or less, all the subsequent musical attainment. Who of us has not groaned in spirit over the pupil who presents us one of the Sonatas of Beethoven, perhaps, and who, in playing it, shows a possible comprehension of the musical idea, but combined with a technique not merely deficient but almost hopelessly chaotic and entangled? How must we offend and even bewilder such a pupil by obeying the stern dictates of musical conscience, and saying gently: "I must have you do scale work, and octaves and chords" And how difficult it is to retrace steps which could have been trodden with ease in the beginning! Every good teacher feels that it would be invaluable both to himself and the pupil, if he could watch over every practice hour for the first year or two, until the pupil had learned how to study, and was sufficiently grounded to be safely allowed a longer tether. One finds that in new ground weeds spring up more quickly and plentifully than planted seeds, and to eradicate these weeds is essential to the proper sustenance of the awaited flower. So it is with the student. Multitudes of faults crowd thickly around the instructions given, and should be uprooted instantly, for any sort of result. It is not assuming too much to say, that if a beginner was allowed to practice only in the presence of a competent teacher for one hour a day for at least the first year of study, the ground covered would equal that usually traveled in two years or more, and the result would be positively surprising. Yet how many parents who recognize gifts in their children, and who really desire them to be properly cultivated, would be willing to provide such facilities at the commencement of what may prove a life career? I leave out of the count altogether the unintelligent people who expect John or Jennie to play "pieces" at the end of the first term, and only reckon with those who realize that there is a decided interval between sowing and reaping, and Aaron's rod appears only occasionally, even in the form of genius. Some of this number would say, "Why, I cannot afford to pay so much for primary instruction. By and by I shall need to supply the best the market affords to finish my son's or daughter's course." Ah, Monsieur or Madame, you cannot possibly make a graver mistake. Nor a more expensive one. By and by, the by and by for which you are reserving your best efforts, will, when it comes, be a sad day of trial for the ambitious student, and your own pocket-book, compelled, with pain and humiliation, to retrace steps that never should have been taken; the task which would and should have been comparatively easy in the beginning, becomes a drain upon body and spirit and purse. Only those pupils made of the best sort of stuff have the patience and courage to travel back and make an entirely fresh advance. And this they do handicapped by accumulated bad habits. Those of us who know the reason of these things must meanwhile listen to such aspersions as these: "It is all foolishness to change teachers. One undoes all the other has done, and you waste your time and your money on them."

No, the fact is simply this, that one does what the other has left undone, and in order to do it, has to put aside what is too unsecurely built to endure the stress and strain of really high achievement. There is no royal road to learning in art any more than in science or literature. The training of the hand, which is the machine with which all one's work must be done, is a necessity which cannot be dispensed with, and which rests upon certain basic principles which simply cannot be ignored. There is just so much power, just so much dexterity, just so much lightness and ease, to be made one's own before the rendering of the work of those who possessed these qualities and wrote for the possessors of them, is possible. Would this could be realized and provided for! "Custom exacts, and who denies her sway?" The parent exacts, the impatient pupil exacts, and the long-suffering teacher, who must, alas! live by art, as well as for it, is often crowded to the wall, and compelled to put aside judgment to meet those exactions. It is rather trying for Brown to be told: "Why, my daughter was with you a long time, and then played no pieces at all. I sent her to Smith, and she soon played ever so many pieces." You know you had been breaking the ground for Smith in the first place, and that perhaps in the second, Smith had been tempted to do what Jones or Robinson might have to undo later, but what can you say? There are the pieces! The ear is satisfied, and how many know that it is only the hearing ear the Lord hath made, and which can distinguish between Brown's method and Smith's?

Meantime, the primary teacher goes wearily on, conscious that, not only underestimated and poorly paid, but with all his or her sowing probably to be reaped by another, some one must do the preparatory work if America is to become musical. We hope and believe that she may, but it will not be until she learns that the secrets of art are for the worker and not for the guesser. Yankee shrewdness and the superficiality which is fed by an almost supernaturally quick apprehension, the national heritage of our country, will not avail, unless supplemented by some degree of the European dogged perseverance and hard work. I have personally known graduates of our conservatories sent abroad for supplementary and so-called "higher" study, who have told me that the first step that they had to take was to learn to practice, and to have a sub-teacher who sat with them during practice hours. Scales, arpeggios, octaves, chords and the rest of the basic processes by which technique is built up, were they relegated to, and this as if they were little children. Surely these things ought not to be, and yet they are, and largely because of the want of patience and wisdom on the part of parents, even more than pupils.

It is all very well, theoretically, to insist upon the duty of the teacher and faithfulness to it, no matter what the result, but the faithful teacher is very apt to be left stranded high and dry, to twiddle his conscientious thumbs, while the man who calmly and unblushingly remarks that "He is in the business for the money there is in it," caters to the whims of pupils and parents, utterly indifferent to subsequent consequences to both, and consoled and sustained by a constantly increasing bank account. Far be it from me to condemn him without a recommendation to mercy. The enthusiast generally finds himself without any eventual capital but enthusiasm. But surely it is, or ought to be possible to reconcile, to some degree, the practical and the theoretical, and to bring home to people the absolute necessity and the great importance of the earliest training in fundamentals. Upon a commercial basis, if no other, the logic of the situation should be apparent. Every wasted and misspent and misdirected hour spent by the pupil will have to be paid for, not merely at the time, but later on, with interest. The fifty cents or a dollar spent on a preparatory lesson will not merely be thrown away, but later five dollars a lesson will follow it, while the work is being done which must be done sooner or later. How much better, how much cheaper to pay a living price for good work! How much better for parents, upon whose wisdom to a certain extent, depends the future of their children, to build for them upon a broad and sure foundation! How much better to spend a little more at the moment, and less in the long run, with a greater result from a smaller expenditure! How much better for pupils who are to be in their day and generation, the hope of America in music, to be patient and painstaking and plodding for a little while. It is doubtless frightfully stupid and tiresome to be planted, a tightly shut up little seed, down in the damp, heavy garden mould. One cannot see or scarcely move, and nothing seems to be happening, day after day. Yet something is happening, nevertheless. Day and night go slowly by, as the ground grows drier and lighter, the pressure is less, one can move a little, it begins to be warm, there seem to be faint sounds in the distance, soon there is really a little bit of freedom. The earth parts a little way, a very little way, one may begin to look up and about. The head is free, little by little the limbs, now the stem lifts the leaves higher and they open more and more, and at last from the poor, stupid, shut up seed buried in the dark, there comes into being the plant bearing the full rich beauty of the flower.

Is it not better to be patient and do one's growing in the dark? Is it not better to play over and over one's scales until the fingers are as supple as the curling tendrils of the vines, as facile as the drops of running water? To patiently work at octave studies until the wrists are strong and flexible as the branch of a tree, or a blade of Damascus steel? To go over arpeggios and chords until it is possible to reach out as the branches of the tree to the blue of the sky, and the green of the ground, and encompass thus all harmonies of earth and heaven? It is only after this that people can be won and moved, by so speaking the music of the great dead writers that they live again, making them immortal through the high endeavor of the player, and raising those who listen to the same height. There is no other way to high achievement but the way of patient labor, and we must not confound patience with anything that lacks strenuousness. It is patience which fails and tries again, patience which keeps on trying, patience which is the root from which springs the plant of courage upon which blossoms worthy achievement. It is impossible to overestimate the value of preparatory work, and the necessity of sparing neither time nor pains while doing it. The end will more than repay for the work—infinitely more.

Herein will the teachers find the difficulty. Will they have the courage and the nobility to resist all pressure that may be brought to bear upon them, and to insist upon the proper performance of duty by those under their charge? Face to face with the knowledge that all human results are but partial, and that frequently the man to whom success is due remains unhonored and unknown, will they, nevertheless, endeavor to aid that success? Will they remember that the man whose reward comes quickly and apparently easily is rarely the man who deserves it? And that we must share not merely all that we have, but all that we are, with many who will not only be inappreciative, but ungrateful? But all teachers should look upon their pupils as their children in art, and consecrate themselves to their best and highest development, and count their measure of success not so much in dollars as in the calibre of work that the pupils can do. It requires courage to see them, after long sowing, pass to another who shall reap the result of this labor, and to feel that an added gain will accrue to them. To some it is given to express their ideals, so that all may realize them and their possession of them. To others again, though the ideals remain visible, they are not able to show them in their own work, though they may be able to so declare them

that the pupil will be able to show them by their attainment. But one and all of us can remain true to what our art demands, and our pupils absolutely need. We can so prepare them that when they pass to others, unless those others be unprincipled charlatans, the worth of our work will be acknowledged to a certain degree, and the pupils themselves will look back to us with more and more gratitude as they realize more fully all that our endeavor meant to them, and those who seem the humblest of us may make ourselves of the greatest value.

STUDIO GLEANINGS.

KATE KINGDON.

Individuality.

She came into the room, on my response to the scarcely audible tapping at my half-opened studio door, a demure, girlish figure, gray-gowned, and without ornament or adornment, save the meek and quiet spirit of scriptural enjoining; experience had taught me caution regarding forming "opinions at first sight," but I was conscious of an impression of harmony and rhythm. She wished to begin lessons at once, and had even brought sheets of music, fresh looking. New and unused, I supposed; but I was in error.

"These," she remarked, taking them calmly from the wrappings, white as the silken gloves she wore, "I studied with my last teacher, and for three months I had nothing else. So I became discouraged. I trust that is not also thy method?"

A pupil appeared in the doorway as I looked over the sheets, a *Caprice*, by Heller, the "Dance of fhe Snow Flakes," by Engelmann, and some studies, the latter bearing everywhere through the pages the pencil markings of the "last teacher."

"I cannot give you a lesson to-day," I said; but I named a day and hour, and quietly as she had appeared, my visitor departed.

Promptly to the moment, upon the day and hour I had set, the gentle tapping came again at the door. Gray-clad and demure she entered, while a curious sense of "time" having "turned," and jumped me back several days in the calendar to repeat the experience past, of her first appearance, assailed me for a fleeting instant. All was as then, even to the words that were uttered. But presently the gloves, and the modest gray hat, with its drooping brim, were laid aside, and we proceeded to commence work at the piano.

The "studies" were attacked, after considerable skirmishing with preliminary exercises, with a view to remedying certain defects an examination of her hands revealed. Understanding that I desired her to memorize the exercises, and use them as a prelude to her practice each day, each minute detail received the closest study. I was put through a cross-examination which would have outrivalled efforts of the most tenacious lawyer. Having acquired an exact and careful knowledge of every movement, she gave her attention to the "studies," with the same precision. Every precept and admonition given her she had followed to the letter; where both were lacking, her own conception had stood her in hand; thus, which had been productive of the most mischief, the precepts, or their lack, it would have been difficult to say. After a page had been performed, with grievous errors, manifest to a nicety, we took up the first phrase, and after a half-hour's struggle to right glaring wrongs, note by note, movement by movement, she attempted, at my request, to play it entire, and as I had drilled her. It was an absolute reproduction of her first performance.

As to the pieces, the *Caprice*, by Heller, which should have presented to the mind a butterfly's ecstatic revels in flowery meadows, or the subtle gleamings of a will-o'-the-wisp through the night marshes, every measure was as calm and monotonous, as unvarying, as the pulse-beats of the player. And the "Dance of the Snow Flakes!" Poor, little metronomic snow-flakes, that semed wailing their own requiem! Subsequently our experience with Engelmann's inspiration was of such a nature that I think every snow-fall I witness through the remainder of my mortal existence, will connect me with it in memory.

Suffice it to say that, as it was *not* "my method" to keep a student three months on pieces wholly unsuited to her conception and temperament, even if within her grasp technically, a change was speedily effected. The "last teacher" would have done well to add the study of mental and dominant characteristics to her studio life and work. But we learn by experience, and to my quaint, little exact Quakeress I owe one which has been unique. We turned her propensities to account, and it was not long ere she was learning a new set of studies precisely right, instead of precisely wrong, and I have already optimistic glimpses of a time when certain of Mendelssohn's "Songs Without Words," of various Nocturnes, and of the *Berceuse* she is now studying, will be charmingly rendered.

A Physical Problem.

An eminent teacher once remarked that he owed more to the cultivation of positive qualities than to any natural or acquired proficiency.

I have read somewhere that the teacher of the negative type need have no hope of success, and this is possibly true while the negative tendency holds sway. It is true in other lines of endeavor than that of the music life; the successful, without exception, are the positive. Certain observations, and the relation of a personal experience by the teacher referred to, impressed me with a new estimate of this important element, and I applied my reflections to the solution of a problem.

Teachers are often annoyed by the perversities, and inconsistencies of pupils, and by the fact, also, that susceptibility to these varying moods robs them of their own best enthusiasm in endeavor for the pupil. This taking on the pupil's moods is the cause of much of the ill-success of which teachers complain, with certain types of students, to whose trying propensities the reason alone is ascribed, while the teacher often is the most at fault.

In a well-appointed studio, dainty and attractive, I sat, not long since, with a woman not past her prime, whose troubles with pupils, as she related them, would have furnished material for volumes, which might bear the title, "The Tragic Side of Music Teaching," *by One Who Knows*. Her face was furrowed too early, and on her own statement she has already succumbed twice to mental and nervous prostration. It is not many years since her classes were filled to overflowing; her time so in demand that an advanced student was drilled for assistant work. I knew her in those days of busy prosperity, a woman of keen intelligence, equipped in every respect, it would seem, for the work she had chosen, and having received her education abroad under the finest teachers.

To-day she surveys the ruins of her brightest hopes, for added to afflictions of a family nature, her pupils have many of them left her for the assistant teacher, who now has her own studio. The grievances of the latter were great, it was claimed, and she accepts redress in sympathy and pupils.

Listening to the account of the defects and ingratitude of those who had turned away to the evidently more attractive assistant, the words I had read regarding the teacher of the negative type, came to me with renewed weight. Here was illustration of it in effect. There is literal truth in the theory of the working force of thought, and had this repining, embittered woman held in mind only a charitable, helpful conception, in place of constant mental censure and criticism, ignoring, and refusing to be swayed by faults which were prominent and nerve-wearing, she would have disciplined both herself and the pupils manifesting them. Love and the charity that thinketh no evil holds power as a positive force, and let him who doubts, test, and thereby prove the statement, reaping its sure benefits in his studio life and work.

Recital Clubs.

The student receives much advice through the pages of music journals pertaining to turning to account opportunities. Indeed writers and teachers are so intent on pointing out to pupils the importance of following such advice, that their own "occasions" pass often unperceived.

One may learn, and turn to account, from pupils, if alert and receptive to such observance, daily and hourly, an amount equal in value to instruction imparted. A young girl who had studied in a western town, began lessons, on the removal of her family to the east, and among various suggestions gained from her by her new teacher, and eventually modified and carried out, was one which resulted in far-reaching benefit, since the plan was later adopted by other teachers of the city.

In the enterprising towns of the west, it seems the teachers of music partake of, or absorb, the general spirit of energy and endeavor. This voluble young woman was fond of talking of the ingenious methods of her teacher for sustaining the interest of pupils. Her class was large, and scholars came to her even from an outlying hamlet and nearby farms. An arrangement was made by which one evening in each week was spent by the entire class at the home of a pupil. A program was prepared, and varied in its arrangement of diversions, though always including playing by different pupils, so that when the round of the homes had been made, every student had learned and performed a new piece.

Here was an opportunity to glean an idea, which, being culled by the eastern teacher, and gradually ripening and expanding, led to the forming of a "Recital Club," the pupils meeting monthly, and all wearing the Club badge, which signified a pledge to perform a different piece at each recital.

Trust no Future, howe'er pleasant!
Let the dead Past bury its dead!
Act,—act in the living Present!
Heart within, and God o'erhead!

—*Psalm of Life.*

PLAYING FROM MEMORY.

Liszt was the first pianist who played whole programs by heart. Weber seems to have been the first conductor who was able to get along without a score. An accident proved this. At Dresden, one evening, Mozart's "Magic Flute" was to be given, conducted by Weber. The moment to commence was drawing near, when it was observed that the score of the opera had not been placed on the director's desk. Great consternation was among the musicians. The court was expected to arrive at any moment, and the orchestra well knew that Frederick August would be enraged did their instruments not burst into harmony as soon as he appeared. The anxiety extended to the audience; Caroline, the wife of Weber, looked at the empty desk before her husband with agitation. Weber saw the danger, but he smiled and, without losing *sang froid*, sent some one to search for the score; but the court entered at about the same instant. Weber glanced at his trembling wife to reassure her, grasped his baton, gave the signal to begin, and conducted the entire first act of the opera from memory, without a note of the music, with his usual vigor and ability, even amusing the orchestra by pretending to turn the pages at the proper moment. The affair soon became noised about, and reached the ears of the royal family, who personally overwhelmed Weber with compliments. —*New York Evening Post.*

We are what Zeus made us, discords playing
In the great music, but the harmony
Is sweeter for them, and the great spheres ring
In one accordant hymn.

—*Anon.*

GLEANINGS.

"Impossible!" Talk not to me of that blockhead of a word.—*Mirabeau.*

If every year we rooted out one fault, we should soon become perfect men.—*Thomas a'Kempis.*

When we take people merely as they are, we make them worse; when we treat them as if they were what they should be, we improve them as far as they can be improved.—*Goethe.*

Praise to the face: open disgrace. "No such thing. The proverb is wrong. Praise to the face is one of the sweetest things on earth, and there is no disgrace in it, unless untruth enters, or unless the praise is undeserved."

"There is so much to be set right in the world, there are so many to be led, and helped and comforted, that we must continually come in contact with such in our daily life. Let us only take care that we do not miss our turn of service, and pass by those to whom we might have been sent on an errand straight from God."

What have I to do with the yesterdays or the to-morrows of my life? My responsibility lies strictly in the present. Why should I scatter and weaken my thought-forces by regretful recollections of the imperfect yesterday or anxious anticipation of the uncertain morrow? I will concentrate all my energies upon the passing hour, and thus will atonement be made for the past and grace developed for the future. To-day—*to-day* I live. The grief of yesterday is past. To-day I triumph. To-morrow shall find me still a victor.

Expert Opinions

Anent "A Critique and Some Comments Thereon."

Art and Business.

In the April MUSICIAN was printed an article by T. L. Rickaby opening a symposium on the average concert criticism. This was followed, in May, by an excellent article by S. N. Penfield. In this issue the symposium is continued in a third contribution, which speaks for itself.

To the May number Mr. Rickaby, who seems especially able to launch interesting discussions, contributed an article on "Business or Profession, Which?" This subject is taken up by Ferdinand Dunkley, who discusses it under the caption of "Art and Business." These articles will be followed by others. We will be pleased to hear from our readers generally.—Editor of THE MUSICIAN.

ANENT "A CRITIQUE AND SOME COMMENTS THEREON."

HARVEY WICKHAM.

An article in the April MUSICIAN, by T. L. Rickaby, under the title which I have given above in quotation marks, was of such a suggestive character that perhaps he will pardon me for continuing his line of thought and discussing some of the points raised by his pen. Be it understood, however, that I do not measure lances with Mr. Rickaby, whose excellent article I am glad of this opportunity of endorsing. Controversies, to be instructive, must arise between those who, from identical premises, arrive at different conclusions. Too often disputants are found who are actually writing about different things which they, unfortunately, call by the same names; or, about the same thing which they call by different names. From such arguments may the spirit of concord deliver us. As futile, tiresome and unnecessary are such debates as those in which the debators have nothing in common from which to make a deduction; or, have no dissimilarity of opinion on which to hang a quarrel. The latter case is nearly, I believe, the case of Mr. Rickaby and myself, and if I seem, in some minor particulars, to contradict him, it will be for the reason that a writer necessarily leaves out here and there a modifying clause which, though unnecessary to the justice of a position he is for the moment taking, might be very essential if he were to apply a given principle, say, to some other case. For example, one says that classical music is unfit for general concert use; and from his context it is easy to see that by classical music he means music of a particularly thoughtful or abstruse character. I affirm that classical music is apt for all occasions where real music is desired; but for my context, if I did not particularly define it, a discerning reader might know that I used the word classical to mean excellent. Still another writer comes forth and "classical" with him means of the school which began with Bach and ended with Beethoven. But in all these cases there is no ground for controversy, and only the hasty and ill advised would fancy one. With these words of explanation I will proceed to the consideration of a few questions suggested by Mr. Rickaby's paper.

FIRST. What principles should govern us in the selection of the music which we perform in public?

There are two factors to be considered: the capacity of the probable audience to understand and the capacity of the performer to interpret. Of the latter let me speak first. The widespread dislike of classical, that is to say, of *good* music, which undoubtedly exists among many classes of people, is due not so much to the people themselves, or to the music, as to the performers. Many and many a man who has never *heard* any, has said: "I can't appreciate classical music." He may have been at concerts where high-sounding names appeared on the programs, but high-sounding names, aye, even such names as Chopin and Schumann, do not necessarily stand for classical compositions. All composers have written works which are insufferably dull. There are passages even in Beethoven's sonatas which are not all that might be. Indiscriminate praise of every measure of the masters is not wise. True, a musician can never write anything that is altogether bad. His technic and style are, to a certain extent, in evidence always, unless it be in the case of youthful and immature pieces unfortunately brought to light. But even Homer nods, and it is not well to expect the uninitiated to grow enthusiastic over passages which we ourselves venerate only, perhaps, for the sake of their author. I am not saying that a passage which is ever so dull cannot be made interesting by superlative execution. The simple major scale, dropping like a string of pearls from the fingers of a master, is well worth listening to. But the masters are few and far between, and a musical composition has usually to depend upon nothing more than a tolerable rendition. This brings me to the question, Does classical music usually get even a tolerable rendition? And I answer, sorrowfully, "No!" And thus it is that many read fine compositions on programs and sit in their seats while certain musical crimes are being committed, and erroneously conclude that they have heard the works in question. They have really heard nothing of the kind. The soul of music is melody. The more "classical" a piece is the more the melody is apt to be overlaid with arabesques and accompaniments. Accompaniments which do not stay obligingly down in the bass, but spread themselves over the entire keyboard. Under the hands of the artist the melody floats pure and serene on the wings of a beautiful singing tone above its intricate support. In the hands of a mere pianist (I limit myself to the consideration of this instrument for the present) the picture is *all* background. And this is but one of the reasons why pieces are, so to speak, seen and not heard. Therefore, I argue that the executant should select music which he can play, which usually is music much easier than one commonly hears. The great virtuosi have no trouble in interesting even "miscellaneous audience" in music of a high, even if not the highest, grade, and it is a simple proposition that the greater the player the greater the works which he can make interesting to a given body of hearers.

Now, as to the capacity of the audience to understand. It shall be borne in mind that a concert selection must appeal to an ear which it hears for the first time. Musicians study the compositions of all schools continually and they become necessarily apt in appreciation. It is absurd to present to average listeners works which even the professional musician learns to love only after long familiarity. It should be thoroughly understood that there is music in the world for everybody. Music for the street gamin, music for the pedant, music for the poet. Each kind is good in its place, whether humble or exalted. The point to be taken care of is that each kind is kept in its place and is not allowed to masquerade in the guise of a fellow. At the concert music must be for the people. For the best element likely to hear it. Many people go to concerts not to hear, but to see; not to listen to artists, but to listen to conversation. In arranging programs this class can be left nearly out of consideration. A single number that will silence their gossip, if it is not too unmusicianly a number, is well enough, but the bulk of the program should be aimed at the general average of those expected to be present. The tone of patronage in which many professionals speak of the public is by no means warranted. Too often the fault is on the stage and not in the seats. One composition should also be given for the benefit of the two or three highly-cultured folk who can be depended upon to appear at almost every assembly. Nothing more than a modicum of common-sense, tempered by experience, is needed to gauge a program aright. No musician can afford to render works which are actual trash, and therefore I intimated, at the beginning of this article, that good music should always be used, but by that I mean music good of its kind. Music is not nececessarily bad because it is simple or gay or rhythmic. But let me hasten to another question.

SECOND. What shall be said of the facetious, ignorant critic?

The man who doesn't know "a bar of music from a bar of soap" still lingers on in our midst, a painful contradiction to Darwin's comfortable doctrine regarding the survival of the fittest. If the man did not make the assertion of his ignorance so boastfully one might pity him; but no sooner are the words of mock humility out of his mouth than he sets about to show how much worse it is for music. Seldom, indeed, does one hear an individual say that he is deficient in musical culture, without being told by implications, and in the next breath that, though lacking in art, he is not lacking in smartness. A facetious *critique* exudes a sense of its author's complacency which would be side-splitting if it were not heartrending. Nothing is easier than to be funny according to some definitions of fun. It is time that newspaper men learned that it isn't funny according to a very exalted definition of the word to confuse music with soap. Nobody boasts nowadays not having read Keats or Wadsworth or Tennyson. Many have not read them, but they know enough not to mention the fact. The time is rapidly coming when it will be understood that art is as much a part of culture as poetry or *belles lettres*.

THIRD. Is the voice the instrument best adapted to the popularization of music?

I am emphatically of the affirmative opinion. To the voice all instruments must look for their ideal, in a certain sense. In striving to imitate the voice all artists have achieved their highest triumphs. It seems to me that in instrumental music the great composers have touched the deepest hidden chords of emotion, but so far as the great public is concerned it is to the voice and to the voice alone that they must look for help in their attempt to understand our art. Once teach a man to love singing and he is in a fair way to learn to love playing. But of one who pretends to love the latter without having learned to appreciate the former, be distrustful. He probably is fond only of jugglery and gymnastics or is totally insincere in his professions. But Mr. Rickaby has entered so fully into this branch of the subject that I need not add another word.

ART AND BUSINESS.

FERDINAND DUNKLEY.

Probably one of the most significant characteristics of musical life in the present age is the ever increasing attention which musicians are giving to business-like methods of making the best possible living by means of their art. Several questions arise in connection with this matter which it may be profitable to consider. 1. How is it that musicians are trying to become good business men? 2. Is business capacity compatible with artistic temperament, and what are the prospects of success to a person endowed with the latter quality? 3. Will the cultivation of business methods cause musicians to deteriorate as artists? 4. Is this growing tendency to look after business ends to be deprecated or encouraged?

In answer to the first question, it may be said that the complex conditions of modern life open up so many more possibilities of business than formerly. Quick means of communication by mail, telegraph and telephone and quick means of transportation make possible the execution of an amount of business that could not be dreamed of in the days of Mozart and Beethoven. There is an ever-growing demand for music and musicians. Probably the increased facilities for supply foster the growth of the demand. At the same time it must be noted that the increased demand for music and musicians has certainly fostered a belief that music may be made a profitable means of livelihood, and has induced tremendous swarms of people to enter the musical profession, with the result that in certain localities and in certain branches the supply is too large for the demand, and almost everywhere there are so many competent musicians to be obtained that a professional man or woman must be alert and business-like, or their dream that music may be made a profitable means of livelihood is apt to be shattered by stern reality. The circumstances and necessities of modern life are therefore compelling musicians to try and become more business like than they were in the past.

The next question is whether business capacity and

artistic temperament are compatible, and what are the chances of success to a person endowed with the latter quality. There are poles in the human organism and an enormous number of directions in which the being may be developed. It will hardly be disputed that the source of the genius of the greatest composers was rather in their profound emotions than in their intellect, nor will it probably be disputed that the source of the genius of the great financier is rather in his intellect than in his emotions. What would we care about Beethoven's mastery of form if his forms were not filled with the profoundest emotional utterance? What do we care for Bach's mastery of form when occasionally the emotional element is absent? Who cares for the ingenious puzzles of the early Flemish composers? Palestrina lives by reason of the sublimity of the religious emotion expressed in his art. Bach is one of the greatest of the immortals because most of his works do contain a profundity of emotional expression rarely attained by others. On the other hand, would most of the great financiers of the world have attained their fame and wealth if they had been creatures of emotion, swayed hither and thither by every passing fancy and feeling? A negative answer will hardly be questioned. Undoubtedly, therefore, the emotional source of the artistic temperament and the intellectual source of the financiering capacity must be regarded as opposite points in the human organism, and the more positively the nature of the individual poles in the one direction the less forcible is its operative power in the other. The inference from this course of reasoning is that genius for finance is incompatible with genius for art, and that the chances for success in business effort by the artistic genius are unfavorable.

The fact that many a poor genius has died in poverty substantiates the argument. But so far the question has only been answered in regard to the exceptionally endowed individual, and the annals of history clearly point to the fact that the man of really marked genius has been comparatively rare. Considering the thousands and thousands of musicians at the present day, what a minute percentage of them can be placed in the genius list! Therefore, if this study of the relationship of business to art is to be of any practical value it must be applicable to the mass of musicians. But let it be said right here, that if the musical genius has but a poor chance of success in business effort, so has the person who, professing music, expects by mere business method, to be successful while having little or no talent in his art. Such a man can only be a fraud. His business methods will consist of trying to deceive the public into believing that he is a man of competent musical ability, which he cannot be if he has no talent and, sooner or later, the public will find him out to be an imposter and swindler. And so, putting aside the cases of the extreme genius and the person of no talent, let us now consider the intermediate possibilities and the people who can perhaps maintain an equable balance between business and art. Success in musical business is dependent upon the ability to place and keep before the public one's genuine talent and attainment. The man who makes his fortune manufacturing and selling a valuable commercial commodity does not accomplish it by the mere dexterity of his advertising and management of his sales, but because, primarily, his commodity is a good article and of value to the public; his business-like handling of it is only a secondary factor in his success. If his article were of no value all the advertising in the world would not give it a hold. As musicians we have therefore first to see that there really is musical worth in us and, if there is, we must next see that we turn our worth to the best account. Let us not hide our light under a bushel. There is a lot of hypocrical humbug in the notion that it is undignified for an artist to advertise himself. The hypocrisy lies in the inordinate conceit that fancies the world will not fail to recognize such a gem of talent without its having to be placed in the most advantageous setting. On the other hand, we must not forget that it takes a trained eye to distinguish the real gem from "paste," and that a large number of people are satisfied with "paste" for jewelry; in fact, there is a large demand for cheap trash of all descriptions. This demand for cheap trash is not from an inherent depravity of human nature, but results from a condition of ignorance and want of culture combined with poverty. And a human being deficient in culture and wealth is not on that account to be spurned. His wants must be catered to, and it is no disgrace to cater honestly to them. What would we say of a board of city fathers who should close up all the large or small stores selling cheap dry goods and notions, cheap furniture and cheap wearing apparel, and only grant permits to do business to the owners of fashionable jewelry stores, furniture stores selling only carved antique oak chairs and tables, etc., and to expensive tailors and milliners? At the same time our fine stores displaying their magnificent and costly goods are an education to the uncultured class. Would the peasant, suddenly becoming rich, who had never seen works of art, bric-a-brac or anybody in fine clothes, immediately purchase such articles? It is not the town parvenu who, finding himself rich, begins to purchase all the costly gilded articles he had noticed when he was poor? On account of the sudden change in his fortune his judgment may err, but little by little his taste becomes refined and his children, at least, may display perfectly good manners. Therefore I argue that there is a place for inferior music, that it is a necessity, and must be furnished to the people of ignorance and lack of culture, and the musician who feels he has nothing better to do may take to catering to that class of people. But people in all walks of life are trying to infuse culture among the ignorant, and I imagine the dealer in artistic furniture takes pleasure in educating the public up to appreciation of the goods he offers, and having a belief in the value of his goods, he is not himself going to open a cheap notion store which might be more profitable, but which would seem to him a step backward in the line of progress, culture and refinement. It takes a man of his refinement to deal in artistic wares; let the uncultured man cater to the class demanding trashy goods So with the musician. Let him do the utmost with his own talent, taste and culture, appealing to the classes that can appreciate his particular plane of work. He need lose no opportunity of drawing attention to his work, as the secondary factor of skilful business management will, in no small way, contribute to his success in making his fortune out of his genuinely valuable commodity of trained talent. Art and artists are only debased when high standards are given up in order to possibly make more money by catering to the ignorant and uncultured on their own level and perhaps below it. Such business should be scorned by the artist. I wish, however, not to be misunderstood. *Condescension* will sometimes win sympathy, and it may be necessary sometimes for the artist to condescend a little, win sympathy and then begin to educate up to his own standard. Many young enthusiasts do not understand the value of condescension. I confess to my own mistakes in this direction in former days. Church musicians, perhaps, more than any other class are in need of this tactful policy. The church musician has to deal with a class of people that the concert musician knows nothing about. Only the more or less cultured people go to concerts, but people of every class and description attend church and have to be pleased by the music. A congregation may contain people of most fastidious musical taste side by side with the most ignorant and unrefined, and yet the latter have a right to music which will be helpful to them in their worship. It is the duty of the church musicians to help the ignorant in their worship by at least an occasional admission into the service of a song perfectly simple in its harmony and melody, comprehensible by the simple, uneducated soul. People of simple peasant or factory life do not have the complex emotions of more highly developed humanity. The elementary material for musical expression—tonic, dominant and subdominant—is all they can understand. It is not necessary to condescend to the vulgar tendencies which are found not only among the poor but among the rich. Many a musician, for the sake of business and popularity, debases himself and his art by pandering to latent or expressed vulgarity, and the most vulgar music is often found in the churches consisting mainly of the wealthy.

But passing on now to the third question—will the cultivation of business methods cause musicians to deteriorate as artists—we may say, emphatically, no, so long as the business adopted is nothing less than the endeavor to make the most of one's talents and attainments. Of course, the limits of the time must not be overlooked. A man may spend so much time in managing the business end of his profession as to leave too little time for study and further development. In that way he may deteriorate. If artists undertake to manage their own business they are apt to suffer from lack of practice, etc. Better to employ a manager or secretary. The mere exercise of honest business policy will not deteriorate any man; on the contrary, his ambition is more apt to encourage his artistic development. The final question is easily answered in the light of what has already been said. In these days of severe competition strict attention to business is necessary if a competent artist is not to be left to starve (and there is no æsthetic requirement that he should) while a more business-like rival succeeds. Moreover, the fakes and shams are always very business-like, and the uneducated public *is* deceived for awhile by "paste" and the genuine musician has to be wide awake and alive to combat these frauds. By all means, let us encourage this growing business tendency among artists, so long as it is pursued along honorable, high standards, with a genuine love and reverence for art as a substratum. But be it remembered that talent is inborn, and if the genius is overpoweringly absorbed in his art and has no time, talent or inclination for business, he will never succeed by his own efforts; his only hope is to be taken up by someone who has the means and the desire to help such an one. The majority of musicians are not such, however, and may develop a well-balanced business and art equilibrium.

Editor of THE MUSICIAN.

Dear Sir—The article in the April number of THE MUSICIAN, by T. L. Rickaby, entitled "A Critique and Some Comments Thereon," interests me, for it is a subject I have thought about a great deal. While I sympathize with audiences who do not appreciate the best in music, it seems only right that musicians who can perform music which would elevate the popular taste should be allowed to do so. I claim that music should elevate the mind and soul and not simply amuse. Tastes are so diverse that, in trying to reach and please the simplest, a very large proportion are starved, musically, by those who could give them true musical nourishment. People ought somehow to be *made* to understand good music. The best way to understand it is to hear the same work given repeatedly until it becomes dear through familiarity. Thoroughly good music wears well and will bear many hearings. As this method is seldom possible to the average concert-goer some more instantaneous means must be devised, and I would like to make a few practical suggestions.

Let the titles be given in English. Music is no finer for being played under a title in a foreign language. Then, if the piece be at all a descriptive one, try to find some quotation or stanza which can serve as a keynote to the thought and have it printed on the program. In case the performer does not mind speaking before an audience a few words of explanation of the piece are very effective.

Not all of us can address an audience as happily as does Mr. Edward Baxter Perry, but it would not hurt anyone to tell something about the piece he is about to perform and would surely add much interest to the performance. It is always well to print on the program the words of the songs and choruses sung, whether they be sung in English or some other language.

Notice the programs of Mr. and Mrs. Georg Henschel and you will see that they adopt this plan, even though they appear before the most cultured and educated audiences in the country.

At a recital recently given by the pupils in our music department there were two MacDowell pieces played, one of which had a descriptive verse and the other had not. The audience was much better pleased with the "Poem" than with the "Danse Andalouse," though I think they were equally well performed. In regard to the song, "Vilanelle," spoken of by the editor, I would suggest that if the words had been printed on the program the audience would readily have seen that the music describes the flight of a swallow and was not meaningless pyrotechnics. I feel that it is a wrong thing to play down to the audience and that the right way is to let the audience into your secrets and draw them to your standard.

KATHERINE P. NORTON,
HIGHTSTOWN, N. J. Peddie Institute.

We cannot play the chords of "success" upon an instrument relaxed by disappointment and discouragement, nor with the harp-strings held at nervous tension by anxiety and fear. Doubt and longing are destructive of all harmonies. Only a masterful confidence in the universal Life and in ourselves as its expression can strike the notes of power and produce the clear, full tones in which true purpose finds complete accomplishment.

Young Composer's Column.

RULES.

1. MSS. marked "Young Composer's Column" must reach us by the 10th of the month to ensure notice in next issue.
2. Each MS. must bear the full name and address of the writer; the initials will be used unless a *nom de plume* is added.
3. Stamps must be enclosed if MS. is to be returned, but it is to be distinctly understood that the Publishers assume no responsibility for any MS.
4. No charge is made for the examination of any MS., and compositions of any nature may be submitted. The criticisms will be general and of such a nature as will be helpful to those honestly desiring frank and unbiased criticism.
5. No criticisms will be sent through the mail.

J. P.—(414). Yes, "Canzonetta" does show real musical feeling, and you may take every encouragement from it. The melody is good and the harmony fairly so. You must take pains with your naturals; they look like sharps. In meas. 4, we think the discord on the second eighth-note is unpleasant; *C* is a discord improperly left (according to counterpoint); (1) change the melody to *D-A-G-A* for the eighth notes, or (2) change the harmony to that of *F;* in this case *D* becomes an appoggiatura. The implied octaves between *D* and *G* in left hand and *E* and *G* in the melody, meas. 4–5, are too palpable for good writing. Most musicians would write *G♯* for *A♭* in meas. 3; according to Macfarren *A♭* is preferable. In meas. 9 the transition to *A* major savors of a false relation, though the *ritard* helps to make the *C♯* less abrupt. In regard to publication this may always be said: Do not be in a hurry; wait until you have something to print; wait until you can print a set of songs or a set of piano pieces. Have you something else to show?

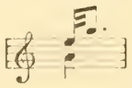
B. J. B.—(415-416). You make a very good *MS;* that of itself is a passport to favorable consideration. The violin and piano piece is poorly named; it is hardly a Reverie—more properly a dance tune. But let that pass; what's in a name! The melody is good—not particularly original and the harmonies correct. There is too much *D* major in it: Too little variety of tonality; then, too, you should add a coda of four bars to make an ending; at present it does not end: It stops. The octave etude is better, though its coda is not thoroughly "shaken down." You can do better. On the whole a grammatically correct, creditable piece of music; played with "snap," it would prove stirring and effective. Any criticisms we should make would be confined largely to matters of detail; the last note, p. 1, right hand, ought not to be *C♯*: It weakens the half note (minim) *C♯* following it; make it *B* instead. Several cases of this sort need attention. We are glad previous criticisms proved helpful.

Questions Answered.

[Under this heading THE MUSICIAN will be pleased to answer any questions submitted by its readers which may be of general interest. *All questions must be accompanied by the full name of the questioner.* Answers will be published without such names. Those who send questions should take care to state clearly what information is wanted. Only such questions as will be of interest to general readers will receive attention in this column. All others will be answered privately, for which purpose stamps should invariably be enclosed.—ED.]

F. L. G—The Spanish Dances, by Moszkowski, Op. 12, and Water Scenes, by Nevin, Op. 13, would embrace grades 3, 4 and 5. Possibly the majority of the compositions may be graded at four.

G. C.—The short appogiatura when placed before a double note, is played by striking it simultaneously with the lower note, the upper note following quickly after. An exception to this rule is frequently made in the case of octave, when the grace note is played alone, *on the beat*, and the octave after. Not in this manner:



Felton.—A. Henselt, pianist, died in 1889 and Carl Tausig died in 1871. The latter was but 30 years of age. He was born in Poland.

L. W.—Trills, the manner of performance, and various methods of termination are too numerous to give examples in this column. The rule of to-day is to begin the trill with the note which is written.

O. H.—Bratsche is the name given by the Germans to the viola or tenor violin.

A. M. P.—Rhythm is "the systematic grouping of notes with regard to duration." It is often confused with its sub-divisions, *accent* and *time*. Form is the number, order and key relation of the various themes that are combined to make an extended composition. The Theory of Music is the doctrine as it regards speculation on the science and its object—sound—independent of practice. But the term is commonly used to express a Knowledge of Harmony, Counterpoint, etc. Harmony is defined as the art of combining sounds and their consequent succession. A composition can hardly be said to be transposed from major to minor; it may be changed into the minor mode: In which case a choice could be made as to whether melodic or harmonic form. Whichever should be chosen must affect voice and accompaniment alike.

F. B.—Tacet is a Latin word meaning silent: It signifies that the instrument does not play, or take part in the movement where the word is written.

Reviews.

HANDEL. By C. F. Abdy Williams. Published by E. P. Dutton & Co. 12 mo. 268 pp. Price, $1.25.

This volume of biography belongs to the "Master Musician" Series. Like the other volumes of the set, it is handsomely issued in convenient form. Of its contents it may be said that compressed in its two hundred and odd pages is an interesting and quite comprehensive story of Handel's career, told in a popular style. The chief events of his life are narrated without too great detail. A chapter is devoted to anecdotes, which are quite characteristic of what we know of Handel, and form not the least interesting part of the book.

For the general reader this life of Handel will be found amply sufficient. It is written in clear, fluent language and without exaggeration. A catalog of Handel's work, a bibliography and glossary containing outlines of the lives of some of the chief characters with whom Handel came in contact.

FIRST STEPS IN THE HARMONIZATION OF MELODIES. By J. E. Vernham. Published by Novello, Ewer & Co. 64 pp. Price, 50c.

An elementary work, simple in its presentation of the subject and well calculated to take the student on from the first steps to the harmonization of simple melodies. If the information herein contained is well mastered, further progress is a comparatively easy matter.

Faith comes when music stirs us, and the chords
Moving on some grand climax shake our souls
With influx new that makes new energies.
—*George Eliot.*

FOSTER THE BEAUTIFUL.

LULIE R. PITTS.

For some time, negro workmen have been busily engaged cutting away the trees from a high, wooded hill that overlooks my home. All day long we can hear the syncopated strokes of the axes plunging into the heart of oak and chestnut and hickory, and, at intervals, there comes a mightier volume of sound as, one by one, the proud denizens of the hill top that have stood silhouetted against the sky for so many leafy summers and bare, brown winters, bow, obedient to the axeman's will, and, with sudden sforzando, come crashing down to earth. The negroes strip the fallen trees of their branches, load them on wagons, and with shouts and lashings, urge the patient teams along the rough, sloping roadway. Day after day, week after week, goes on this treadmill of toil.

Just below is a panorama surpassingly beautiful, a bit of real landscape that shames the artist's brush.

I wonder if these perspiring sons of toiling Africa are conscious of the beauty about them. I wonder if they ever pause long enough to refresh their spirits with one delicious, invigorating draught from the fountain of nature's loveliness bubbling at their feet, or, having eyes to see, are they dulled by inappreciation?

How it would lighten the labors, and brighten the lives of these workers if some Prometheus from the art world would fire their souls with a sense of the beautiful, if the prayer of some modern Elisha might touch their eyes, and open them to a realization of the teeming beauties that lie in the valley below—the clustering houses of the village, the clean, shaded streets, the velvet lawns, the long trains in serpentine motion, the town clock ruling off the hours from the courthouse tower, the millstream brimming with water from the spring freshets, the distant farm houses, the blue smoke curling heavenward, a thousand things to delight the eye and enchain the senses.

Fellow teachers, our pupils are laboring on a mountain of difficulties. With sharpened intellect and hatchet of technic, they are working steadily day by day. Beginning awkwardly, practice brings skill, and every difficulty, however largely proportioned, is doomed before the scientific strokes of these young toilers. But it is uphill work and severe, so irksome, indeed, that not even the glow of happiness that comes from a consciousness of duty well done can brighten the dull routine of daily drudgery. Little wonder that they often grow weary and discouraged!

How changed the conditions if we would frequently bid them look beyond at the marvelous beauties of the tone world about them—the majestic harmonies, like columned cathedrals built by the master's hand; the streams of melody murmuring low, sweet lullabies to overstrung nerves and jaded brains; the gaily dressed themes, wending their sinuous, unerring way through wildernesses of passing notes and dissonant intervals.

Nor is this all. There were beauties on the hilltop if the workmen could have seen them. Yea! at their very feet! Ruskin would have set every fallen leaf and naked twig and mossy tuft pulsating with a newer, richer life. Assisted by the chemistry of a well developed imagination, his telescopic vision would not have contracted on the bare, rough logs before him, bound for the winter's fuel, but rather on the glowing hearthstone, the flames dancing merrily skyward, the fantastic images shaped amidst the shining embers, the warmth and cheer enjoyed by the family circle.

May some kindred spirit quicken the minds of our young musicians, causing them to realize that every dry, uninteresting note is vibrant with tone life if they will only attune their ears to hear. The artist hand gathers up these same despised fragments and puts them together in wondrous mosaic to form the masterpiece, which the tottering fingers of little learners may some day grow strong enough to hold up to the delight and pleasure of many hearts.

Music is not merely a matter of notes and finger agility. Ours is the exalted privilege of awakening young minds to a sense of the grand and beautiful, of showing our pupils how to listen with comprehending ears to the crescendo of the thunder's roll, the diminuendo of the wind's whispers, the crisp staccato of the pattering raindrops, the smooth glissando of the brook's murmurings, the fortissimo of the cataract's roar, the myriad voices of Nature, and use them in the interpretation of tone language.

If these things are not paramount in our work, we have left the true god of music and gone after idols; we have neglected the substance while chasing the shadow; we have sold our glorious birthright for a mess of pottage.

Give me music; I am dumb,
Choked with tears that never come;
Give me music.
—*Bayard Taylor.*

EMIL PAUR ON AMERICAN MUSIC.

"Your opportunities for hearing the best of music have until recently been too limited. You have been too busy with things commercial and material, but that is all rapidly being changed. With fine orchestras playing the works of the great masters in your leading cities, and with societies bringing this music to the hearing of the great mass of people, you are gradually getting to live and breathe in a musical atmosphere, out of which come musical intelligence and inspiration. And mark you, a people so marvelously gifted in every other branch as you Americans will, and must, ere long, take a commanding position in the musical world, and produce composers of the highest order."

"I place Mr. MacDowell, of Boston, at the head of the list of composers. He has composed a number of suites and other works that are of real merit and beauty. Second on the list I would place Mr. Paine, who has a number of symphonies and other compositions to his credit, notable among them being his 'Œdipus,' which is extremely beautiful. There are, of course, a large number of younger composers who are aspiring to high things, and some day will make themselves heard."

I look upon Handel with reverential awe, as the inspired master of our art; I acknowledge him as such, and the highest praise is due him.—*Gluck.*

THE STUDY OF A SONATA.

Beethoven's Op. 2, No. 3, in C.

DR. HENRY G. HANCHETT.

FOURTH ARTICLE—RHYTHM.

In three preceding articles attention has been drawn to some general considerations regarding this sonata, to its movements, to its meters and to the way in which its measures should be numbered for reference; namely, by placing a number before every bar, single or double, throughout each movement separately, counting measures as printed, not as played, and regarding the "Trio" as a separate movement. We come now to a consideration of the rhythmical peculiarities of the work and to some details of interest connected with them.

So general and persistent is the incorrect use of the word "time" in connection with music that it seems necessary to say again that there is no such thing as "common *time*" or "six-eighth *time*." If a piece having four quarters to the measure is in common time, a piece with three quarters to the measure should be in royal, good time, and a piece with nine-eighths to the measure should be in time for dinner. All these expressions are equally sensible and quite as correct as "three-fourth time" or "nine-eighth time." Time is a period of duration and the "time" of a piece is indicated by the metronome (the musician's clock) or by such words as Allegro, Adagio, Andante, etc. The *meter* of a piece is absolutely independent of time, and is indicated by figures showing how many beats there are in each measure and how the pulses are arranged; that is, pieces are in "Four-quarter *meter*," "Six-eighth *meter*" or some other. The rhythm of a piece is the way in which notes of different values are placed in connection with the pulses or beats of the meter. In some cases a rhythm is "characteristic," as in a polonaise (where the three-quarter meter is filled up by an eighth, two sixteenths and four eighths) march, mazurka or other dance form. In others it is free, the composer writing such note lengths as please him, only being careful that the total time value of notes in each measure shall equal that of the specific note values indicated by the meter sign.

STUDIO OF MRS. J. MORGAN BRUCE, LOUISVILLE, KENTUCKY.

At the very opening of our sonata we find what may be called a "rhythmical design" lasting through six beats and consisting of a half, four sixteenths, two eighths and two quarters. In thinking of this design the ideas of harmony and melody are to be excluded, and only the relative length of the notes kept in mind. Perhaps this can be better done if the design is described as consisting of a long, four short, two rather short and two rather long tones. And, for the sake of further distinguishing ideas, we may glance at the opening of the Adagio, where we shall find the same melodic idea as at the opening of the Allegro, and in both cases the idea twice stated. The Allegro opens with the melody on the mediant, descending to the super-tonic, then mediant, then sub-dominant, mediant, super-tonic and dominant, the second and third notes being played twice in succession to make out the rhythmic design already mentioned. The Adagio opens with exactly the melodic design indicated, leaving off the last note, but with a different rhythmic design, and differing in harmony by the use of the dominant seventh instead of the dominant triad for the final harmony. In the second statement of the idea the Allegro takes the same cases in reverse order, while the Adagio uses the same chords in the same order but in different inversions. In other words, the germs of both Allegro and Adagio movements are melodically the same, harmonically nearly the same, but rhythmically very different. In fact, the Scherzo starts out with a new rhythmical modification of this same melodic idea. Here the idea is abbreviated but the essential change is in rhythm. Look particularly at the second voice entering upon E. This comes after an E and D in the first voice, which are the octaves of two notes that, were they written before the second voice, would give it all but one of the notes of the opening melody of the first Allegro, that one being the last note of the first measure. Even the last movement gives a hint of this same melody with a new rhythmical setting—the long note becoming here a triple scale of short notes and other variations being introduced but without abandonment of the melodic basis. The opening of each of the movements then may be said to be secured by rhythmical modification of the same melodic idea, and this may be taken as one form of rhythmical development.

In the first movement itself more palpable forms of rhythmical development are to be found. For example, in measure six we see a development by condensation, so to speak. The figure, beginning in 5, is completed upon the second beat of six, but that beat having a syncopation in the tenor, which influences a *sforzando* accent in all voices, comes in like a belated half note and is almost, if not quite, as individual as a half note would be; thus we get the impression of the beginning a second time of our rhythmical design upon the same tone which concludes its first presentation in 5. This same effect is reproduced in the bass of measures 9 and 10. In measure 21 we have a new development of the design, the quarter rests followed by two quarter notes representing the long note, the trill the short ones, the thirty-second notes forming the conclusion of the trill, representing the rather short notes, and the imitation ending with the quarter as the representative of one of the rather long notes. In measure 77 begins what may pass for a retrogressive imitation of the design. Commencing with the third beat we have the rather long notes, then the short and rather short, represented again by trill and conclusion, then an interpolated quarter and then the long note. This passage is continued by a partial imitation, and the opening of the second part of the movement brings this new form of the design twice in full. The use of the partial imitation based upon the original design is seen at measure 114. At the *130th* measure begins a very pretty effect, due to overlapping the design in antiphonal style between the tenor and soprano voices, in a manner akin to the "stretto" of a fugue. The cadenza, measure 233, plays with a portion of the original rhythmical design.

One of the most effective of rhythmical devices is syncopation, where the notes are so arranged in the measure as to force the accent into a contradiction of the metrical accentuation. The syncopation may break the regularity of beats, of the groupings of beats in a measure or of the groups of measures. If syncopation is not associated with frequent assertions of the regular accentuation it loses its effect speedily, the mind accepting the syncopations as a new order. The force of the device lies in the surprise occasioned by its contradiction of the expected rhythmical order; therefore, the regular order must be frequently reiterated or the syncopation loses its force.

A syncopated note is one that occurs on the unaccented portion, either of the beat or the measure, and holds over the following accent, but it is not necessary always to have a syncopated note in order to secure the effect of syncopation. For example, measures 128 and 129 of the first movement call for a reversal of the natural accents and are syncopated measures, but they contain no true syncopated notes. It is curious, however, to note that these measures are of doubtful notation. The original edition has the "*sf*" signs on the first and third beats, old editions had them between the beats; that is, about half way after the first and third beats, while modern editions generally have them on the second and fourth beats. Were there no such special accent marks the force of the chord as against the single note and the analogy of the four preceding measures would almost certainly induce a syncopated interpretation; but if the *sf* was intended to apply to the first and third beats, the unusualness of the return to the regular accentuation and the contrast with the preceding four measures, would still give an effect akin to syncopation. In measures 69 to 73, on the other hand, we find syncopted notes which do not produce the effect of syncopation, because each one is opposed by a note of equal importance on the beat; the passage amounts to little more than an alternation of eighths, although some individuality is given to it by the legato syncopated notes against the staccato in the right hand. In the 73d, 74th and 75th measures decided syncopation is effected by accented marks in connection with rests on the important beats in the left hand without true syncopated notes. Syncopation is graded in importance by the number and importance of the voices in which the device is employed. Measure 6 has a very mild syncopation, as it is only in the tenor with other voices regular; in measure 9 it is stronger, in measure 11 still stronger and even more effective in meaure 31. But the most effective syncopation of the sonata is the second movement where measures 7, 9, 19, etc., show the device in full value. A fine example of measure syncopation will be found at the opening of the "Coda" where the *1st* and *3d* measures regularly should begin with forceful accents, but do begin with rests, thus making the opening of the second and fourth measures strong, as if they were the important measures in the groups of two. The fifth measure, however, restores the former arrangement.

In a following article attention will be given to some harmonic considerations suggested by our sonata.

"A loyal critic is kinder than a flattering friend."

THE MUSICIAN.

A Monthly Publication.

EDITED BY
ARTHUR L. MANCHESTER, A. G. O.

PUBLISHED BY
HATCH MUSIC COMPANY.

SUBSCRIPTION PRICE.

SINGLE COPY . . . . . $ 15
PER YEAR 1 50

Free of Postage in the United States, Canada and Mexico. Foreign Postage, per Year, 72 Cents.

Remittances should be made by Bank Draft or Check, Post Office Money Order, or Express Money Order. *Where none of these can be procured*, money can be sent in a Registered Letter.

New Subscriptions can commence at any time during the year.

Discontinuances.—The publishers should be notified when a subscriber wishes his paper stopped. In the absence of written notice to the contrary, subscriptions will be continued.

Communications are Solicited from all interested in the teaching and study of music, and in furthering the success of THE MUSICIAN. All articles or communications intended for publication should be clearly written on one side (only) of the sheet. Those which cannot be used will be returned.

All Letters should be addressed and **Remittances** made payable to

HATCH MUSIC COMPANY,
Publishers of THE MUSICIAN,
Eighth and Locust Streets, PHILADELPHIA, PA.

The Publishers of THE MUSICIAN do a General Music and Music Publishing Business. They can supply anything in Music.

A SECOND REVIVAL.

Readers of THE MUSICIAN recall the praise bestowed upon Mendelssohn for his revival of Bach's Passion Music. Every biographer of his has laid great stress upon this labor of love. The difficulties of the task have been pointed out and a corresponding degree of credit been granted to Mendelssohn. We have rather inferred, too, that such a revival was possible only in Germany. That elsewhere conditions were lacking and the right man unavailable for so great a work. The artistic atmosphere of America was supposed to be too attenuated for such an accomplishment.

●

Yet a revival of Bach music, which includes not only the St. Matthew Passion, but the Christmas Oratorio and the B minor Mass, has taken place in a small town in Pennsylvania. Bethlehem—a significant name in keeping with the story the music illustrates—on May 23, 24 and 25 was the scene of a very remarkable Bach festival. The three great works of the Leipzig Cantor were then sung by a chorus gathered from the residents of the town, under conditions which made the event practically unparalelled. The traditions of the old Moravian town, the quaint customs, among them the announcing from the cupola of the church of service and concert and death of residents by a trombone choir, increase our interest in the consummation of this festival.

●

But these things with all their attractiveness are but side lights; it is with the character of the work done that we are chiefly concerned. And our scrutiny discloses an artistic achievement well worthy of Mendelssohn himself. The work of the choir was remarkable throughout. The exceedingly difficult music was sung with a certainty of attack, a finish of execution and attention to detail that has called forth the highest praise. Naturally there have been dissenting voices, but the fact remains that a noteworthy musical event has taken place in our midst. When it is remembered that those who sang these works are not professional musicians and that they and their conductor contributed their services as a labor of love, we must concede that America is not so hopeless as some would have us believe. A full report of this estival is printed on pages 178 and 179.

THE M. T. N. A. AGAIN.

On another page may be found a sketch of the program of the meeting of the Music Teachers' National Association at Put-in-Bay, Ohio. It will at once be perceived that the educational influence will be paramount. This, however, is achieved without lowering in the slightest degree the artistic character of the concerts. Indeed, these are evidently a vital part of the educational scheme. The artists who take part have prepared their programs to please and benefit a body of musical educators, with the result that the whole presents a well-rounded and comprehensive program. The business meetings, as previously announced, will also be of great importance. And the officers are very much gratified in being assured that the delegates will be a thoroughly representative body of musicians. Acceptances from all parts of the country, with definite promises of attendance, give assurance of the gathering of a body which will be able to gauge the needs of the entire country.

●

It now remains for the mass of teachers to signify their interest in the work the Association is attempting to do for their benefit. The Association must have support, financial and moral. The membership fees are very small, but when aggregated would furnish all the funds needed to carry on the work. The encouragement afforded by a large attendance will be of incalculable assistance, but if you cannot go, why not join the Association, identify yourself with its aims, give it your financial support and add to its prestige. Its success depends on the building up of a large, permanent membership, and every reader of THE MUSICIAN owes it to himself, his fellow-teachers and the art he professes to love to become a member of the Association and take part in the work it proposes to do. Think about it fellow-teachers. Send to the Secretary, Thomas a'Becket, 1541 North 19th Street, Philadelphia, Pa., for copies of the *Messenger*, the official organ of the Association; investigate the policies and methods that have been announced and decide whether it is not your duty to aid the officers and make the M. T. N. A. a really influential educational factor in the music life of the country.

●

AMBITION WHICH OVERLEAPS ITSELF.

In the voice department is printed a letter from a singer of the Berlin Royal Opera Company. What is there said will arouse criticism as well as commendation. Without entering into the merits and demerits of this communication, it is pertinent to say that a reckless striving to satisfy ambition is a dangerous procedure. Ruin awaits in many forms the unwary or overambitious. A determination to succeed is well, but the old saw, "Look before you leap," contains more than a modicum of common sense. Stay at home; study yourself and your capabilities as much as you do your music, and take care to analyze and thoroughly understand conditions before thrusting yourself into strange environments.

●

The most successful business man is he who unites with bold aggressiveness a patient study of conditions. Any anticipated move forward is undertaken only after care has been taken to gather information of existing and possible aids and hindrances. Pride and personal desire are held in restraint. It is not always so with the ambitious singer or teacher. A glittering promise is accepted as a certified fact, pride and inclination take the reins, and, too often, disaster results. The American teacher and American customs and conditions of life are better adapted to American students; and success, while it may be slower, is more certain, and is attained with the expenditure of less life energy than when sought under strange and handicapping influences. Beware of alluring promises and prepare yourself well before undertaking any ambitious endeavors.

FAULTS.

There are certain attributes common to all mankind, and generally they are such as might best be dispensed with. The moralist has ample ground for his philosophizing in the tendency of human nature to reproduce the undesirable, while those traits which attract are much more rare. So, too, the weary teacher often wonders why pupils will apparently go far out of their way to make, or perpetuate, a mistake, when the proper method is so much more easy and desirable. Frequent are the sighs of discouragement that have come from the patient, painstaking teacher because of the repetition of faults many times corrected.

●

The study of psychology will let light into the understanding of many such teachers. They will cease to ascribe to natural depravity, the inclination to musical evil so dominant in their pupils; they will rather discover that habits of thought, mental trend, lack of perception, a misunderstanding are the root of much musical evil. With this discovery will also come that of ways and means. As the mental and physical tendencies of the child—of large growth also—are comprehended and taken into account, the remedial requisites will suggest themselves.

●

Here we are thrown back on the primal question—the need for thorough preparation on the part of the teacher, not only in the technical knowledge of music, but in the whole subject of pedagogic science. It is becoming more and more clear that *faults* lie not alone in the pupil. Even the conscientious, painstaking teacher alluded to has faults which are productive of faults in the very pupil, whose hardness of musical heart he is bewailing. And these faults are often unperceived by him and continue to exert a baneful influence on his work.

●

What is the remedy? Self-investigation, a study of psychology, close observation, contact with fellow-teachers, interchange of ideas. In short, a general watchful, absorbing condition of mind that extracts from all surroundings and from all happenings lessons from which deductions are made and experience built up.

●

A teacher who does this will continually grow in efficiency and will be sustained in the tiresome, discouraging work which inevitably falls to his lot. He will become cognizant of another fact also, namely, that this same careless, fault-perpetuating pupil is securing a foundation on which, when years bring discretion and an added sense of responsibility, a far better musical superstructure will be builded than the teacher imagines possible.

●

The writer has in mind a pupil, a little girl of twelve years, whose bump of heedlessness and careless indifference seems almost phenomenal, and whose three years of lessons have been a thorn in the side. Correct habits were drummed into the consciousness only to be apparently dropped into oblivion. Explanations were repeated until the teacher almost made them in his sleep. Firmness, coaxing, appeal to sense of right, all seemed to avail but temporarily, and discouragement was inevitable. But one day there dawned on the teacher the fact that when this pupil so minded she could play unusually well. That hand position, tone quality, rhythm and other essentials were pretty well adjusted after all. For some time doubt prevented a full acceptance of this fact but, eventually, it became certain that the efforts so patiently and apparently so unavailingly put forth had borne fruit and a good foundation had been laid, and when that pupil was given up it was with a clear conscience.

●

Faults are not unconquerable. Conquer them in yourself as thoroughly as in your pupil. Do not waste effort, but find out the best way, and then stick patiently at it.

The Twenty-Third Annual Convention of the M. T. N. A.

Preparations for the meeting of the M. T. N. A. at Put-in-Bay Island, July 2-5, are well advanced. The program is practically complete. Naturally there may be changes, but its character will be unchanged. From the outline printed herewith it will be seen that the promises of the officers to make the meeting of special value in an educational sense are more than fulfilled. The advantages to be derived from the Lecture-Lessons alone will be worth the cost of attendance. These are very comprehensively planned, and will be carried out with scrupulous care.

The following syllabi of these Lecture-Lessons indicates their scope.

Syllabus of Lecture-Lessons on Piano-forte Technique, by Miss Kate S. Chittenden, of New York.

July 3: Relationship between pupil and teacher—the beginner—the new pupil who has studied before—the introduction to the four lines of technical thought and the development of these parallel lines.

July 4: Essential teaching not exceeding the group of seven notes.

July 5: Work for full-sized hands—the balance between the mechanical and the emotional in piano-forte study.

Syllabus for Lecture-Lessons on Voice Training, by F. W. Wodell, of Boston.

July 3: Teacher and Pupil. Studying the pupil—finding out condition of mind and voice—examining voices.

July 4: Fundamental Principles of Voice Culture. The conditions necessary for production of good tone—for development of tonal beauty—power—compass—flexibility—agility.

July 5: The Teacher at Work. Application of fundamental principles—methods of teaching—means employed to meet needs of different classes of pupils.

Syllabus of Lecture-Lessons of Normal Methods, by Mrs. Emma A. Thomas, of Detroit.

July 3: The Child Voice. Correct method of training the child voice—how monotones should be treated—how to deal with boys' voices during mutation.

July 4: Rote Songs. The value of rote singing—how many, and what kind of, rote songs should be used.

July 5: The Supervisor. The relation of the supervisor to the regular teacher—the supervisor in relation to general affairs.

The Round Table discussions will be essentially informal. It is proposed to have them afford opportunity for a free interchange of opinion and experience. Topics have been assigned certain speakers, but they are not intended to intervene with the proposition of any other that those in attendance may desire to introduce. This feature of the meeting can be made unusually valuable if the members will prepare themselves to take part in them.

Of the concerts it can be said they will be of a high class. Each program will be distinctively helpful as well as entertaining. There are some unusual attractions, notably the joint recital of songs and duets by Messrs. Hamlin and Biden, the joint recital of Mr. Sherwood and Mr. Sol Marcosson, and the chorus of eighty female voices under the direction of Mrs. Fry, of Cleveland.

The business sessions promise to be unusually productive of important results. The educational work, now in operation under the auspices of the Association, will be considered and its future planned for. Questions of organization and the establishment of a closer relationship between the National and various other bodies will also be discussed and efforts made to bring about practical action.

Altogether the meeting bids fair to be an epoch-making one in the history of the Association. A particularly pleasant feature is the hearty response of responsible and representative musicians from all parts of the country to the efforts of the officers to give to the Association a well-defined, up-to-date and progressive policy.

The railroads which cover the territory included between Buffalo, Pittsburg and the Ohio River on the east and south, and by the Mississippi on the west, and including Michigan on the north, have granted a rate of one fare for the round trip, while all others can secure a rate of one fare and a third for the round trip, by obtaining a certificate. The Hotel Victory, which will be the headquarters, and is the most luxurious summer hotel in the middle West, has granted a rate of $2.00 per day, including meals and room, or $10.50 for one week.

Those who desire fuller information should send to the secretary, Thomas a'Becket, 1541 North 19th St., Philadelphia, Pa., for the *Messenger*, the official organ of the Association.

We sincerely hope there will be a record breaking attendance, and that musicians generally will show their interest in the future welfare of the M. T. N. A.

PROGRAM

Tuesday, July 2d

10.00 A. M. and 2.30 P. M.—DELEGATE MEETINGS.

Wednesday, July 3d.

9.00 A. M.—ROUND TABLES.

Piano, Oliver Willard Pierce, of Indianapolis, Ind., Chairman
Voice, W. L. Blumenschein, of Dayton, Ohio, Chairman
Public School Music, A. J. Gantvoort, of Cincinnati, O., Chairman
Harmony, Francis L. York, of Detroit, Mich.

10.30 A. M.—LECTURE.

"Music Education, Extensive and Intensive," Prof. Waldo S. Pratt, of Hartford, Conn.

2.00 P. M.—LECTURE LESSONS.

Pianoforte Technique, Miss Kate S. Chittenden, of New York
Voice Training, F. W. Wodell, of Boston, Mass.
Methods of Teaching, Mrs. Emma A. Thomas, of Detroit, Mich.

3.30 P. M.—RECITAL.

Wm. H. Sherwood, of Chicago, Ill., Piano, and
Sol Marcosson, of Cleveland, O., Violin

8.00 P. M.—CONCERT.

George Hamlin, of Chicago, Tenor, Sidney Biden, of Chicago, Baritone
Mrs. Cragg, of Detroit, Mich., Piano
Sol Marcosson, Violin
E. R. Kroeger, of St. Louis, Mo., Piano

Thursday, July 4th

9.00 A. M.—LECTURE LESSONS.

Pianoforte Technique, Miss Kate S. Chittenden, of New York
Voice Training, F. W. Wodell, of Boston, Mass.
Methods of Teaching, Miss Emma A. Thomas, of Detroit, Mich.

10.00 A. M.—CONCERT.

Philip Werthner and Schneider, of Cincinnati, Two Pianos
James Moore, of Detroit, Mich., Tenor

2.00 P. M.—PIANO RECITAL.

Alberto Jonas, of Detroit, Mich.
Mrs. Charles Henry Clements, of Detroit, Mich., Soprano

8.00 P. M.—CONCERT.

Arthur Foote, of Boston, Mass., Piano
William Yunck, of Detroit, Mich., Violin
Fletcher Norton, of Detroit, Mich., Baritone

9.30 P. M.—RECEPTION.

Friday, July 5th

9.00 A. M.—ROUND TABLES.

Piano, Jaroslaw de Zielinski, of Buffalo, N. Y., Chairman
Voice, Louis Arthur Russell, of New York, Chairman
Public School Music, A. J. Gantvoort, of Cincinnati, Ohio, Chairman
Harmony, H. C. Macdougall, of Wellesley College, Mass., Chairman

10.30 A. M.—LECTURE.

"Normal Training for Supervisors," Mrs. E. A. Thomas

2.00 P. M.—LECTURE LESSONS.

Pianoforte Technique, Miss Kate S. Chittenden, of New York
Voice Training, Mr. F. W. Wodell, of Boston, Mass
Methods of Teaching, Mrs. E. A. Thomas, of Detroit, Mich.

3.30 P. M.—CONCERT.

Allen Spencer, of Chicago, Ill., Piano
Mrs. Emery, of Detroit, Mich., Piano
Miss Camper, of Flint, Mich., Soprano
Rubinstein Club, of 80 Female Voices, from Cleveland, Ohio
Mrs. Fry, Conductor

8.00 P. M.—RECITAL.

Mr. Geo. Buddeus, of St. Louis, Mo., Piano, with Vocal Assistance

THE FARMER ORCHESTRA.

The farmers up the state have discovered a good thing—the bass drum. Gunners in New York, like those in other parts of the country, have been amusing themselves too much. They have been killing off our birds, and as a result of this slaughter the insects that prey on vegetation have multiplied so that crops are damaged or threatened everywhere. In the Catskills this year the devastations of caterpillars among the maples and the orchard trees have been particularly exasperating, and there has been much anxiety among the grangers lest their apples should fail absolutely.

But there is hope for the Catskills and for other places. A few days ago a woman blew a horn in her apple orchard, presumably to call the men folks to dinner. She was surprised when a number of caterpillars dropped out of the trees and sprawled beseechingly on the grass about her. She blew again, and more came down. Then she told the neighbors, and they tried it. They blew sonorously upon the shofar, and the conch, and the cornet, and on every other instrument that could be found in the farm houses, and the caterpillars came down as if they had been invited to a meal. Other machines for making music were tested, such as tin pans, and wash-boilers, and bass drums. The bass drum, it is reported, "did good work." It is not the first time that the bass drum has done good work. If one wishes to stir up enthusiasm there is nothing that will do it like a bass drum. Its sonorous note can be heard afar, and when it is heard the boys all say to one another, "The sojers is out," and scamper in its direction forthwith. The scamper rouses the rest of the town, and it follows the boys to discover, possibly, that a peddler or a fish vender has taken this method of calling attention to himself.

Bass drums as cures for caterpillars appear to have endured the test, and they will become as much a part of the farmer's equipment hereafter as plows and caterpillars. Possibly, instruments will be found to affect every sort of insect, and instead of the old-fashioned bird orchestra we shall have the performances of a calathumpian band every morning, succeeded by the appearance of the dustpan corps, whose business it is to gather up the fallen enemies, or by the farmer's boys in cowhide boots whose duty it shall be to dance and stamp the life out of them, it, incidentally, out of the grass. Thus, while bass drums may be regarded as antidotes to the *carpopasia pomonella* it may be found that a hurdy gurdy will prove more efficient with the *orgyla leucostigma*, and that the potato bug will dance quicker to a bassoon than to a clarinet. A brief course in music will be necessary as a part of the agriculturist's outfit, and it may prove to be an advantage to have the piano moved out under the plum trees so that by playing "The Battle of Prague," or "The Maiden's Prayer" he can terrify the gypsy moth out of the limbs.

It may be that a bigger discovery has been made than we suppose, and that an acoustic remedy will be found for the ills we suffer from larger depredators than insects. For example, the farmers are sorely afflicted with tramps. They beg his bread and steal his strawberries and insult his wife and take pennies from his children and sleep in his barn and set it on fire accidentally, because they light their pipes while sitting in the hay, and they run off with his chickens and they occasionally get themselves arrested for some graver mischief and then the farmer is taxed to feed them for years and years in jail, while they are waiting trial. Now if some terrifying shofar can be designed to shake the tramps out of the hay lofts and cherry trees, or to bring delinquent politicians to their offices when people are waiting there to do business, or to scare truants to school and away from the trout brook, or to wake policemen and bring them to a scene of action, the farmers of the Catskils will have opened the way to a good thing and made public benefactors of themselves,

THE NEW EDUCATION.

FOREWORD.

The *New Education* offers its readers, for 1900–1901, the best plan for a year's study that it has yet presented. It will be the best in two particulars: In choice of subject matter and in manner of presentation. The hearty reception which this novel educational feature has met with makes it possible for THE MUSICIAN to continue to develop the idea of home music study and to offer the best advantages that are to be attained in this manner.

The series of subjects for the coming year follows. Each subject is in the hands of a specialist and will be treated practically and as fully as possible in twelve lessons. In order to meet the immediate demands of students who seek information on special points in the work, the editors will be glad to furnish

Suggestions for the further study of any subject.
A bibliography of any subject.
Information on any question in the lessons.
The consideration, and, if necessary, the presentation, or general discussion of any point that comes up in actual teaching.

The subjects for the coming year are as follows:

I. Advanced History of Music; twelve lessons, with suggested reading.
II. Psychology and Pedagogy of Music; six lessons in each subject; suggested reading.
III. Advanced Music Form; twelve lessons developing those already given in this department.
IV. Harmony and Melody; twelve lessons; six in each topic.
V. The Literature of Aesthetics and Criticism in Music, twelve lessons.
VI. The History and Development of the Piano, twelve lessons with illustrations.

The following conditions *must be observed:*

1. Address all communications for the *New Education* department, thus: THE MUSICIAN, New Education Department, 8th and Locust Streets, Philadelphia, Pa.
2. *Do* NOT *roll your manuscript.*
3. The answers for each month must be sent as soon after the issue of the journal containing the subject to which they relate as possible, and before the next succeeding issue. No papers are to be held until end of course. New members can join at any time by sending names and answering questions contained in current issue.
4. The editors are obliged to say that no papers will be read or rated that fail to comply with conditions 3, 4, 5 and 6.
5. No two subjects should be written on one sheet. All sheets pertaining to one subject—for example, History—should be independently fastened.

Ratings will be largely influenced by the following points:

Accuracy.
Clear, concise, yet smooth diction.
Grasp of the subject.
Originality of thought and statement.

The questions following each lesson have two purposes: First, to connect the reader's mind directly with the text—the most fundamental, that is, the lowest duty a question can serve, but necessary. Second, to suggest a thought beyond the mere expression of the words in the text; the highest purpose a question can serve. The first is by far the least useful if he has a memory; the second the most useful if he has a reasoning faculty.

The editors will welcome letters from teachers which contain:

a. Suggestions as to what will make this department more valuable, the suggestion being dictated by the teacher's individual experience.
b. Statements regarding the application of this work with pupils as well as in one's own effort to secure a broader education.
c. If there is any line of thought of practical value to you, and likely to be equally practical to others, let us know it.
d. All such suggestions must be sent to the office of THE MUSICIAN, addressed according to direction given in regulations.

[NOTE.—*New Education* students are specially requested to avoid enclosing *anything* relating to their business with the Hatch Music Company with their *New Education* papers. The failure to comply with this rule causes great trouble. Kindly keep this matter in mind. We wish to call the attention of our students to the necessity of *fully prepaying postage on their papers.* We have been compelled to pay additional postage on a large number of those already received. This should not be, hence we request our students to take care that sufficient amount of stamps be affixed before mailing.]

VII.—THE EFFECT OF THE REFORMATION UPON MUSIC.

PERCY GOETSCHIUS, MUS. DOC.

The great religious agitation of the fifteenth century, which culminated in the momentous reforms of Martin Luther (born 1483) exerted a more immediate, and, in one direction at least, more powerful influence upon music than any other historic event since the discovery of the contrapuntal principle (twelfth century).

From the musician's point of view, the Reformation is identified with the creation of the German *chorale*, a style of sacred song that determined the subsequent fashion of Protestant Church psalmody, not only in the country of its birth, but in nearly all the great nations of the earth, down to the modern era.

The partly just reproach, that the stern religious dogmas and practices of the new ecclesiastic institution seriously impeded the development of the fine arts, is surely not applicable to that of music; for while the rejection of image worship, and the stripping of all external pomp and display from religious ritual may have checked the expansion of artistic imagination and apparently narrowed the artificial visions of heavenly splendor down to a humbler personal relation between man and God—these were precisely the influences that must greatly emphasize the value and necessity of music, as a natural vent for religious feelings that had assumed an infinitely more personal nature. The leaders of the Reformation recognized this fact, and fully realized how great and efficient an ally music was to be in the new Church worship; and to no other detail of the regenerating movement was earlier or closer attention given than to the question of its music. Thus the Protestant Church prepared still another new soil for music, richer in promise of vigorous *natural* growth than any earlier auspices, beneficent and vital as they had been, for their day and generation.

This new soil was in *the hearts of the people.* No longer was the devout enthusiast to be condemned to silence while the incense of music was ascending to heaven; to be forced to content himself with listening to strains that were beyond his comprehension, and in which neither his brain nor his heart had any part. He would pour forth his prayer and praise with his own voice, in songs hallowed by holy word and association, and still so simple that he could learn them readily and throw his whole heart into them; and he would do this in union with his fellows, inspired and uplifted by the sense of fellowship, and thrilled by the mighty waves of melody that swelled from countless hearts, fervid as his own.

Some uncertain attempts at congregational singing had been made long before in Germany, it is true, but it was not until the work of the Reformation was well started that this became an established institution, and, in fact, one of the most characteristic innovations of the entire religious agitation.

Protestant Church music was a closer affiliation of sacred and popular elements than had hitherto existed. It has been aptly called "sacred popular song," and this it was in the best sense of the word. But it shortly became much more than this; the art spirit entered into it, pervaded and vitalized it, and was in turn vitalized by it. It was not destined to remain a narrow convention, confined to the original purpose that gave it birth, but soon vindicated its susceptibility of artistic treatment, and, submitting with unparalleled ease to the skilled methods achieved by the foregone great Catholic schools of musical technique, it burst forth into a grandeur that was to glorify all Protestant ecclesiastic music for centuries to come.

The type and kernel of Protestant Church song is the German chorale—a melody of stately rhythmic character, of rugged strength, sternly diatonic in keeping with its specific religious purpose, and calculated to be sung by the whole congregation in unison (or in octaves). Its origin has been traced, partly to the ancient Latin Church song (from which it derived many of its best hymns, and some melodies that could be moulded into the needed form)—partly to sources within the older German Church itself; and, in no small measure, to secular popular song—modified, of course, to destroy unwelcome traces of familiarity, and to adapt it to the new uses. But, besides these, it was not long before the quickened genius of the Church brought forth *original* chorales. The name of Luther himself is mentioned (probably with considerable exaggeration) in this connection, as author of the famous "Ein' feste Burg" ("A Strong Defence"), and other chorales.

The first book of chorales was published at Wittenberg in 1524.

The harmonization of these melodies, *with plain chords*, was at first simple enough; but, as the harmony devolved solely upon the organist (or other instrumentalists), only the melody being sung by the congregation, there was no limit to the elaborateness of the accompaniment; and here it was that the chorale entered the domain of artistic music, becoming, first of all, the most natural and appropriate incentive to the evolution of the *harmonic* style of writing. Further, these sturdy old melodies became an even more significant source of artistic inspiration when adopted as basis of other art forms—organ fantasies, fugues, cantatas and the like. Joh. Seb. Bach's chorale elaborations for the organ are among the most beautiful of the master's creations, and to this day chorales are not infrequently interwoven in works of ecclesiastic character, or such as contain allusions to religious incidents (for instance, the "feste Burg" appears in a cantata of Bach, in the "Reformation" symphony of Mendelssohn, in a Jubilee overture of Raff, the "Huguenots" of Meyerbeer, and numerous other compositions).

For a time, the pioneers of Protestant Church music followed the example of the Catholic tone masters, and placed the given melody in the *Tenor* voice. This usage was, however, soon found incompatible with the object of the chorale, as militating against congregational singing, and before long they adopted the practice of placing the chorale melody (the "tune") where it naturally belongs, in the uppermost voice, the Soprano; and this became thenceforth the universally accepted method, not only for ecclesiastic music but for the art in general.

What music owes to the great Reformation is the adoption of a distinctly melodious style of song, and the development of the harmonic, or *chord* system—in a word, the inception of the homophonic style of writing, as opposed to the polyphony of the Catholic scholars. The works of the latter had exhibited, to be sure, traces of pure chord-succession; but it was under the influences of Protestant congregational chorale song, that this more simple, natural, comprehensible and forceful mode of part-writing was to develop into an independent phase of musical technique and mark another turning point in the history of music.

QUESTIONS.

1. With what is the Reformation identified, from the musician's point of view?
2. What new soil did it prepare for music, and where?
3. What did the individual Christian gain?
4. What has Protestant Church music been called?
5. Define the German chorale, its purpose, and its four-fold origin.
6. How were these melodies first accompanied, and how later used?
7. What significant change of method was soon adopted?
8. What does music owe to the Reformation?

FORM—SEVENTH LESSON.

Constructive Form.

THOMAS TAPPER.

Having briefly outlined in the preceding Lesson the value and the method of writing simple melodies which shall serve as models of the Phrase and Period, it now becomes logical to see what further gain there will result from these first steps in composition. I have always taken care, in the private instructions which I give, never to fail to impress it upon the young composer that his Phrases and Periods, however well written, however completely they portray the Form in question, are of no value as objects offered to others; literally no one wants them; having worked faithfully and produced the works he cannot rid himself of them. How is this?

It is true, every word of it. He cannot sell this product of his faith and works; even more, he cannot present it to his friends. No one will have it. And the conclusion? The conclusion is one of the most

interesting statements to think upon that ever comes before us. It has been written time and time again and is as fresh and forceful the last time as the first. In all that a man does, the Product has little value; it is the Process that must interest him. He must dwell upon the act of making, not upon the thing made. It is quite the same law that is at the brain of our true living: One who is alive to all there is of life is more interested in Being than in Having Been; in the life of Doing rather than Having Done; in the life of Present Action than of Past Accomplishments. And in all this we read the Evidence of the Active rather than of the Inactive Spirit.

What then is the connection between this, the Law of the Spirit and the fairly dry labor of writing Diatonic Phrases? The connection is intimate. Any action that does not occupy the whole nerve may be said not to be of any spiritual value; what is of no spiritual value does not help one onward; what does not help one onward is not worth doing, and consequently the whole matter resolves itself into this. Shall I occupy myself so completely with this action (or with any other action), *that I shall get all out of it by putting all of myself into it?*

This is the fundamental gain—and besides this there are several minor advantages: Such as learning well by creating; of realizing that no one can fully understand a process until he has often applied it in the creative act. Compare these minor advantages with the general law above stated; most of us confuse matters until we quite forget the fundamental law and raise minor advantages to a monument. No law of Pedagogy (but it should be called a Law of Life), is being more persistently stated to-day than this: That the Creative act is indispensible to the Learner, and that the purpose of the Creation is in the application of the process and not in the pursuit of the result. Hence we are writing Phrases and Periods, not for the sake of offering them for sale, but for the sake of trying.

And now that we understand the purpose, let us set about doing more of it.

Assuming the Phrase in its Short and Long and Irregular Forms to have been written by the pupil—and to have been read also until at a glance the Form is familiar—he may next proceed to writing more Phrases employing the Skip melody instead of the Step. Preliminary to this, let him examine melodies in general and discover that for the most part they are Diatonic in procedure. They do not skip always. The skip seems to be a convenience for getting from one tone-plane to another. Having reached this tone-plane the Diatonic process is resumed again. The tune, "America," is a good example of this.

In all this elementary melody-writing, every complexity of Rhythm should be avoided. Let each measure contain notes of the meter value, or longer notes; but at first avoid notes of shorter value (known as the Divided Beat). By keeping the Rhythm thus simple, the attention is all the more strongly centered upon the tone-succession and upon the inner audible effect.

The pupil may prepare in place of questions, five Phrases as follows:

1. Write a four measure Phrase without Skips in C major, 4-4.
2. The same with Skips.
3. A six measure Phrase without Skips.
4. A five measure Phrase with Skips.
5. An eight measure Phrase with Skips.

THE MAJOR SCALE AS A MELODIC UNIT.

DR. H. A. CLARKE.

The idea of tonality was of slow growth, and had its origin in the discovery of harmony, a discovery that completely revolutionized the art of music. It is possible for a scale, or for many scales to exist which may satisfy the requirements of melody, as for example: The so called Gregorian or Church scales. These scales are, in the opinion of many enthusiasts, even superior to our modern harmonically developed scales for melodic purposes, owing to the freedom with which a melody in any of these old "modes" may move in any direction, unhampered by "leading tones" or "dominant harmonies," or any of the many causes that, without doubt, give a certain amount of sameness to our harmonically constrained melodies. But with all due concessions to the dignity or grandeur, or whatever other qualities may be attributed to these ancient scales, and the melodies that have been moulded from them, the fact remains that they did not and could not give rise to an "art of music" that might adequately express the whole range of emotion, for the reason that the "art of music" consists mainly of an indissoluble union of "melody and harmony." It is true that either one may exist without the other, but they must combine in order to produce a result deserving the name of a "fine art."

It is universally admitted by those who have studied the matter closely, that, as composers gradually added to the number of combinations of sounds that might be made, that a custom grew up of altering the notes of the plainsong, or of the accompanying part or parts by what we would call "accidentals," with the design of smoothing out harsh progressions, for example: One of the earliest discoveries made was, that when the seventh of the scale ascends to the eighth, it should be raised. Nothing but a growing feeling for harmonic succession could have caused this, as it was totally at variance with the Greek Rule—founded on melodic feeling only—that the seventh should always be a whole tone below the eighth.

It is owing to the fact that the rules for altering the notes in this way were taught orally, and seem never to have been written down, that there is so much uncertainty as to the way in which much of the old music was performed.

Evidences are not wanting, that the major scale is of greater antiquity and universality than will readily be credited by those who believe that all music has been developed from the Greek, through the Church scales, to its present state. There is a naturalness about this scale that must have some occult psychologic foundation. It was known to the Greeks and to the "Church" as the Ionian scale, and was condemned by the former as effeminate, and by the latter as lascivious, unwitting testimony to its musical beauty. In revenge, it has driven the "Greek" out of existence, and even invaded the province of the "Church."

By the law of the "survival of the fittest," it has proved its superiority, not only harmonically, but—since great music is a union of harmony with melody—melodically.

In an ecclesiastical scale, there is little difference in the "power" of the various degrees, but in this harmonic scale, every degree is instinct with individuality, bears some definite relation to every other degree, has a desire to approach some, and to fly from others. Many of the most beautiful melodic effects are obtained by forcing certain degrees to move in a way contrary to their inclination, for example: The leading note always wants to ascend—this movement produces a feeling of perfect repose—as in the following passage:

Owing to its desire to fly away from the fourth of the scale. But if it is combined with the fourth of the scale, in the following way, its effect is hightened by its manifest unwillingness to go down:

It is owing to the fact of this individuality of every degree of the scale, that all the best melodies in existence are literally diatonic scales, varied in rhythm and in direction of motion—the finest examples are to be found in the melodies of Beethoven—for example: The slow movement of the Kreutzer Sonata, the melody to Schillers hymn in the ninth Symphony, and, perhaps the finest example of all, the theme of the slow movement of the great piano trio in B♭. Such examples are enough to make one say, that all great melody *must* be *the diatonic scale.*

All the foregoing remarks will apply with equal force to the modern minor scale, it may be fitly characterized as an undeveloped scale. Its minor third gives it its melancholy cast, its changeable sixth and seventh, its vagueness It sounds always as if it were striving to become a major scale, but was compelled to give up the attempt by "circumstances over which it had no control."

The scale may be looked upon as a highly sensitive medium, ready to be moulded into any form—indifferent as to whether the form is good or bad, great or trivial, like the clay from which the sculptor may model an Antinous, and the artizan—bricks, useful things, but not works of "art."

QUESTIONS.

1. How did the idea of tonality originate?
2. What claim is made for the Church scales?
3. Of what does the "Art of Music" consist?
4. What was the Greek rule regarding the 7th of the scale?
5. In what way do the degrees of the modern scale differ from those of the ecclesiastical scale?
6. What is one of the chief characteristics of good melody?

MUSIC TEACHING.

THOMAS TAPPER.

I. The articles on Pedagogy which have appeared in the *New Education* pages, have explained the fact that in his preparation for teaching music, the student must keep it clearly in mind that the process involves two arts; each of which must be studied in accordance with its own peculiar demands. In whatever manner one takes up music, it ultimately becomes needful to give it application, and that application demands careful thought. Having studied music industriously for itself, the intendant some day finds that he must do something with it. And he begins afresh and works out, in more or less detail, what is to be his individual application of it. Perhaps he is to be a choir leader. If so, there is much to be learned about choirs and choir management which is not contained in Anthems. Choirs are made up of human beings, who have human throats, who have human proclivities for being late or punctual, as the case may be; for being willing to assist, or for being stubborn. Then down below the choir is the congregation; the body of people which is taxed for all expenditures They in turn have claims to make upon the choir leader, and in making them they furnish him with a point of view of the subject applied that is also distinctly apart from music pure and simple. Again it is a thoroughly human, practical consideration. Then there are the music committee and the clergymen. More able pens than mine have shown how largely these enter as powerful factions into the question of applying a music education to the practical demands of the choir loft.

II. But this is not Art? No; but it is a feature of Art at want for a living. And we must remember that in how and where we apply the Art we have learned, we display ourselves as completely as we do in the language of the Art itself.

III. So it is with music teaching; two arts are concerned, Music and Teaching. Each has its laws and its penalties, each must be pursued for its own problems. And the unison of the two—we must always remember—is nothing less than an improved human being, a better member of the social order, one who in turn will influence his circle and continue the propagation of what is most desirable in life.

IV. The whole problem then presents itself in the aspect of a question: How may we employ music as an educational subject to the improvement of society? All study of music teaching worthy of being pursued must proceed on this line of inquiry. Merely to make for technical perfection, to produce an example of a method, to flatter a human being's vanity in making it able to "play a piece"—all these aims are so far beneath the actual and possible purpose, that one shrinks from them as actions unworthy of being performed.

V. The student cannot fail to perceive the great value of this point of view. The moment the music teacher enters the arena as one intending to pursue the Art of Music, educationally, for the improvement of the individual and therefore for the improvement of the general social order, he is accomplishing the greatest good that can attend a man's efforts. Incidently it may be stated that with earnest men the aim is always the betterment of the mass; the study of the laws of thunder showers, of river deposits, of the amusements of the lower orders of society, of the relation of chemistry to cooking. These and countless other lines of pursuit which we witness daily, impress us primarily with their value as contributions to a better order of living.

VI. In conclusion, it scarcely need be pointed out that the ultimate object to be attained from the study of Pedagogy is less method than it is the knowledge of how to attain to that broad, human gain which ever results upon activities of the highest order. The student is urged to keep before him, in his study of teaching and teaching methods, just what maximum of

gain this will result to society in general from his personal activity. The moment he comes away from this view of his work, he is lost in the trivialities of life; furthermore, he is lost to the opportunities which surround every man of turning his personal activity into channels which shall affect many people to their gain.

THE DEVELOPMENT OF THE PIANO.

FRANCIS L. YORK.

We have now reached in study the invention and development of the piano proper. It took two thousand years to produce the first piano, and even then it was a very crude affair. Although the principle of the piano action was discovered, it must not be understood that it was at once perfected. Far from it. Many more years must elapse before anything approaching the concert grand came into existence.

The chief difference between the piano and the instruments that preceded it, lies in the fact that on the piano one can play loud or soft at will. But to do this requires a much more complicated action than any of the older instruments possessed, and makers were not quick to discover how to meet all the requirements. After the harpsichord had been perfected, musicians and makers alike felt the need of an instrument that could express more than either the harpsichord or the clavichord. At first endless attempts were made to make the harpsichord itself more expressive. Fètis, in his History of the Pianoforte, says, "Harpsichords were constructed with more than twenty different modifications to imitate the sound of the harp, the lute, the mandolin, the bassoon, the flageolet, oboe, violin and other instruments . . . and yet, with all the complications of stops, springs, extra rows of keys and Venetian swells over the strings, the grand secret—the real shading of the piano and forte—was still wanting."

Scarcely any new article has ever come prominently into notice, but a host of inventors spring up and claim it as their own. So with the piano. It is claimed as the exclusive invention of at least four different nations, the English, the French, the Germans, and the Italians. It is probable that similar ideas occurred to different men in these different countries at about the same time. The harpsichord and the clavichord were both unsatisfactory, and a need was felt for an instrument that could, at least to some extent, take the place of the orchestra in the home. So it is no wonder that many minds were thinking of the same problem. Without going into a discussion of the merits of the different claimants for the honor of having invented the piano, this much is certain: In 1710 or 1711, Bartolommeo Cristofori, of Padua, "made three harpsichords in which the production of more or less sound depends upon the force the player uses in pressing upon the keys, by regulating which not only are the *piano* and *forte* heard, but also the degrees of tone, as in the violoncello." These effects were made possible by the fact that the strings were struck by hammers covered with leather. It is interesting to note that the dampers in these pianos were *beneath* the strings. It was from this ability to produce tones either soft or loud that the piano derived its name, that is, the pianoforte, or, the softloud. The words were also used in the inverse order, the instrument being called indifferently a pianoforte or a fortepiano.

At about the same time a Frenchman by the name of Marius invented, or at least made plans of, an instrument called the "clavicin à maillet," in which the key raised a piece of wood covered with leather against a string. But the action was so clumsy and imperfect that it was never used. It is on this invention that Fètis bases his claim that the French are the inventors of the piano. But as Marius's invention was never perfected, and as he was at least five years behind his Italian rival we may dismiss this claim. The German, Schroeter, is another claimant for the honor. He says that in 1717 he constructed a model of a new clavier with hammers, upon which one could play soft or loud. He is thus by his own showing six years behind Cristofori, and may have easily profited by the Italian's invention. But Schroeter is worthy of more consideration than the other claimants outside of Italy, because it was his instrument, or at least his idea, that inspired Silberman and others to experiment with a mechanism for producing the tone from the wire by striking it. Neither the Italians nor the French made anything of the invention. It was left for the Germans to perfect the instrument. Whoever really invented the piano, as soon as it became at all known, it was eagerly seized upon by the German harpsichord makers and clavichord makers of the time and experimented on in all kinds of ways. Silbermann, of Strassburg, was one of the first to see the possibilities in the new instrument and to devote his time and attention to perfecting it. He made two most carefully, and showed tnem to Sebastian Bach, who after testing them criticised them as being weak in tone and heavy in touch. We know that Bach was to the end of his life partial to the clavichord, but Silberman, rather piqued at the old gentleman's criticism, applied himself to the making of pianos so diligently that he succeeded in making one that even Bach himself pronounced to be without fault. In fact, it was largely due to Bach's influence that Silberman's pianos soon became very popular, and the maker himself became wealthy through their sale. A story is told of Bach, which, though it may not be strictly accurate, ie in its main points well authenticated, and which gives us a good idea of Bach's influence and popularity. Frederick the Great, who was an excellent musician, heard some of Silberman's pianos, and was so greatly pleased with them that he bought the whole fifteen and placed them in different rooms in his palace. Sebastian Bach's son, Charles Philip Emanuel, was at the time in the king's service, and the king invited the elder Bach to make him a visit. The invitation was accepted, and Bach, the elder, arrived at his son's home during the progress of a concert that the king was giving at the palace. As soon as the king was informed of his arrival he ordered his instant attendance, insisting that he come in without waiting to exchange his traveling clothes for a court dress, at the same time declaring that the concert was postponed. He announced Bach's arrival to the courtiers with the words: "Gentlemen, old Bach is come at last, and taking the musicain by the arm led him about through the many rooms where were the fifteen pianos and tested his musicianship while the musiciain tested the piano. As a final test he gave Bach a subject asking him to improvise a six-part fugue on it. Bach found the subject impossible, but improvised a six-part fugue on a subject of his own in such a way as to astonish and delight the king.

Silberman was not by any means the only successful pianomaker among the Germans. Mozart preferred the pianos made by a manufacturer of Augsburg—John Andrew Stein. He says, in one of his letters, written in 1777: "I now give the preference to Stein's pianos. In passages that require vigorous play I can lift the finger or leave it on the note, for the sound is not prolonged beyond the instant in which it is heard; it never shivers, nor does it ever fail to sound, as in other pianos. His instruments have the escape movement, without which it is almost impossible that a piano can render a well-articulated sound. The hammers fall again as soon as they have touched the string, whether the finger be left on the key or not." Mozart also praises his pedals which, however, were not really pedals at all since they were operated by the knees instead of the feet. From this letter we gain some idea of the point which the piano had attained in its development. The action was still heavy—at least it would seem so to us—the key was liable to "block," that is, stay pressed against the string, thus stopping the sound at once and making it impossible for the player to repeat the same tone and, as Mozart says, sometimes the tone refused to come at all. For a long time the harpsichord was regarded as the superior of the piano, even as late as 1765, King Frederick, of Prussia, bought of the famous London maker—Tschudi—the finest harpsichord that he could make. It is not to be thought surprising that the older instrument should retain its hold on both musicians and musical amateurs, for it is, of course, well-established, people already possessed the instruments in their houses, the technique required for the piano was different and much of the music written for the clavichord and harpsichord was not effective when played on the new instrument. Besides, the harpsichord represented the culmination of the skill and genius of hundreds of makers for scores of years, while the piano was new, untried and, in many respects, crude. In other words, the harpsichord was a perfected instrument while the piano was in its infancy. Most of the pianos made at this time were in the form of the grand piano. About 1760, however, a German, by the name of Zumpe, began to make pianos in the virginal form; that is, the modern square piano form. As his pianos were of good tone, responsive action and very much cheaper in price than the grand pianos, that speedily beame popular, so much so that the maker, for some time, was unable to supply the demand for them. It was perhaps as much owing to this maker as to any one cause that the piano superceded the harpsichord, for the cheapness of his instruments caused them to replace almost entirely the older instrument, and an authority of the time says that there was scarcely a home in England that did not contain one. From this time on the day of the harpsichord was past, and it not was long before they began to be curiosities, to be found only in the lumber room or the attic of old country houses. In 1763 John Christian Bach, one of Sebastian Bach's sons and one of the greatest musicians of his time, gave a series of concerts, using the piano and playing on it the best compositions of the best writers. These concerts gave a fresh impetus to the use of the piano and contributed not a little to bring it into favor with musicians themselves. Composers began to perceive the superiority of the new instrument over the old and began to write compositions especially adapted to it. Haydn, for instance, composed no fewer than sixty sonatas expressly for the piano. Composers, too, soon saw the value of the piano for use in composing, it being possible to reproduce, to some extent, the effects they wished to derive from the orchestra. It is told of Gluck that when he was writing his operas he could write with the greatest freedom if he had his piano taken out into the midst of an open field, then he would sit by it writing and trying over on it the thoughts that came to him. His piano may be taken as a fair sample of the pianos of his time so, perhaps, a description of it will give us as good an idea of what was then considered a fine instrument as we can get in any way. It was in the square form, about four feet long and two feet wide. The strings were so thin that a moderately hard blow would break them. The action was very imperfect, the hammers were only bits of leather glued on to the top of an upright bit of wood hinged to the farther end of the keys. It was impossible to strike a hard blow with them, so the strings were usually equal to any demand made on them. It seems almost unbelievable that such an imperfect instrument should have been regarded as at all satisfactory by such writers as Beethoven, Haydn, Mozart and Hummel, and yet some of the finest piano music ever written was composed for just such an instrument as described.

It was at this period that many of the great firms of piano manufacturers were founded. The English makers—Broadwood, the French Erard (originally a German, Erhadt), the Viennese (afterward French), Pleyel—all began their careers of piano building between the years 1760 and 1800. These were the pianos used by the great writers of the beginning of the nineteenth century. In our next paper we shall see the further development brought about by the demands made on the piano by the great executants, especially by the greatest of all virtuosi—Liszt.

Questions.

1. What is the chief difference between the older stringed instruments and the piano?
2. What countries claim the invention of the piano?
3. Who was probably the first to make an instrument in which the tone was produced by striking wires with hammers? At what date?
4. Who was the first to make a really successful piano?
5. What were some of the defects of the early pianos?
6. Give some reasons why the piano eventually came into favor, both with composers and with amateurs.

The orchestra played a gem between the acts and won the applause of the audience. Mrs. X waited at the close of the last act to get the name of the piece. The leader was a recent importation, and with all the willingness of his race to accommodate a fine lady, replied to her question: "Oh ya, I tells you—dot leetle peece vas number derdeen in der green book!"

Mrs. X did not order it next day.

One of the masterpieces of musical clocks, has just been completed for the Emperor of China, in whose palace, besides pointing out the correct time, it will play selections with a fully equipped automatic orchestra. It is pronounced the most complete musical automaton in the world, having eight divisions, each of which has a repertoire of eight melodies. All of the pieces played by this musical clock were selected by the Emperor himself and consist of forty foreign and twenty-four Chinese recitals.

A GUIDE TO THE STUDY OF MUSICAL LITERATURE.

ARTHUR L. MANCHESTER.

There is danger that the painstaking student of music, whose time and attention are occupied in a conscientious study of the principles upon which musical performance and musical pedagogics are based, will become narrow in his outlook, more concerned with the letter of the law than with its spirit. While the Troubadours were creating and spreading among the people beautiful heart-songs, those who professed to be the real exponents of musical art, were quibbling over rules and their application. It may be pertinently remarked that rules and their correct application are essential to a securely founded art. Yet an art that is void of spontaneous, natural expression is but a piece of pedantry. Very essential, therefore, to every student of music is any form of study that prevents the repression of imaginative and emotional freedom.

It is obvious that to any form of musical literature, which incites to imagination and gives stimulus to emotional activity, the music student owes much. When the trained powers of the analyst are brought to bear upon the masters and their works, penetrating beneath the exterior of rule, and laying down, for the novice, the measuring line of scientific exactness, we may expect to catch, at least, a glimpse of the inspiration which, after all, is the essence of music. The library of the student should be well supplied with books which afford opportunities for such views of the heart of music. When, as is often the case, the number of these volumes cannot be great, care should be had in this selection. The two books of Schumann's writings, already mentioned, are a library in themselves. To them can be added works by writers of our own time, which flow with a white-heat of enthusiasm. As has previously been said, with this enthusiasm should be combined soberness of judgment and a firm basis of reason. The best of writers have their predilections, are sometimes carried away by their enthusiasm and fall into the error of exaggerration, but when the author has knowledge, honesty of purpose and a real love for music, his errors are not likely to be so serious as to harm the intelligent, discriminating reader.

Some years ago there appeared a book by an English author which drew immediate attention. Its title was attractive to the earnest musician. "Studies in Modern Music" suggested deductions by a progressive thinker, and one took up the volume with expectation and interest aroused. Of the writer, W. H. Hadow, there was not so much known, and readers on this side the water were compelled to rest their estimate of the book's value on its contents alone. A glance at its title page revealed the names of Hector Berlioz, Roberst Schumann, Richard Wagner, three names, each of which marked a distinct epoch in music history, and around which has raged conflict more or less vindictive. Naturally curiosity was aroused as to what would be said of these aggressive personalities. On turning to the essays the reader soon became convinced that the author knew his ground, was strong in his convictions and united conservatism with progressiveness to an unusual degree.

As biographies these essays are among the best to be found. Healthy in tone, giving due prominence to important phases, interesting without sensationalism, they tell the life-story impressively. An analyses of character they rank high. The retroactive influences that were at work in the formation of man and music are made clear and their pertinence shown. The peculiar characteristics of each composer are well defined and accounted for. Thus, the leaning of Berlioz toward "Program Music" is discussed, and the adaptability of music to story-telling, and Berlioz's success in making music according to the program he announced are fully treated. The author's deductions will be considered thoroughly sound by the majority of readers, for there are many who will always deny the power of music to describe literally and exactly.

When Robert Schumann took up the cudgels for the Romantic School of Music it was in solitariness. In literature, as well as art, preparation had been making for years. But Schumann, by birth—as the son of a bookseller and author—by temperament and by training was an exponent, *par excellence*, of the new school. Hadow studies Schumann and writes about him understandingly and with sympathetic touch. The romantic life, with its sad ending, the conjugal devotion, the development of ideals and the enveloping cloud of insanity are well-portrayed. In its critical estimate of Schumann as a composer this essay is very valuable. The competence of the author and the keenness of his analysis unite in making this feature of his work important. The sketch of Wagner, that provocator of disputes, is equally sane and impartial. Revolutionary theories and music are weighed and judged in their relation to the laws of artistic progress and deductions are calmly made.

These critical biographies are preceded by an important essay on music and musical criticism, a lucid and intensely interesting contribution to this much discussed subject. The tendency, all too pronounced, to accept the dicta of those to whom we are pleased to concede some degree of authority, is characterized as leading to a species of mental poverty similar to that of having a "pocketful of counterfeit coin." Stimulating to a degree are the thoughts of our writer in this part of his book.

It was not long after the appearance of this book that another bearing the same title was placed before the musical public. This second series of studies in modern music presented on its title page the names of Frederick Chopin, Anton Dvorak and Johannes Brahms, three names to conjure with. The biographical sketches were preceded by a dissertation on the "Outlines of Musical Form," which is worthy the attention of every one. The author discovers in this work the same soberness of reasoning expressed in language of fitting purity of style and vigorous meaning.

Such books as these are doubly valuable in that they not only present matter with which the musician is vitally concerned, but that they also furnish him an object lesson in the formation of discriminating judgment through a comprehensive and impartial survey of conditions. If our students of musical literature will procure these volumes and read and re-read them slowly, with pencil in hand, noting down thoughts suggested by the reading, they will not only acquire a technical knowledge that will be of great usefulness, but what is, perhaps, of greater importance, mental powers that will open avenues leading to self-improvement of ever-increasing value.

[NOTE.—At a later period questions will be presented, designed to test the students' application of the principles laid down in this series of articles.—ED.]

APHORISMS.

FREDERIC W. BURRY.

The joy of making some conquest, of mastering some difficult task, more than balances any little passing troublesome incidents. And besides the glory in the accomplishment, we are strengthened for further work.

It is a great mistake to shirk labor, endeavoring to attain results without work. Labor is the principal thing that makes life interesting. There is more real pleasure in occupation, and in observing day by day the growth of some work, than in all the "solid comfort" and ease imaginable.

In so-called trifles lies much import. A wrong note, a false interpretation, misplaced phrasing—how much they mean in the realm of Art. And Art is the symbol of Life; pointing like an index to the real things, holding up a mirror to our ideals.

The world worships a genius—but shrinks from those sacrifices and hardships—that spirit of patient toil and concentrated endeavor which produce greatness. How much better to worship less and emulate more! After all, that recognition of a good example which prompts one to equal and even greater efforts, is true worship.

Examine into your work of a day; enter into the details, and see how much time you can economize in the future. Half some people's time is spent over some unnecessary task, or frittered away in pastimes which do not even amuse. Strange that anyone should be so short-sighted as to fail to see the opportunities slip by, which would lead the way to real and solid enjoyment.

Instead of wasting time over regrets, weak complaints which do nothing but dissipate one's energies, how much better to work away (work gives one no time for foolish fears and worries)—how much better to forge ahead, letting the days fly by, patiently waiting for the time when splendid results will show themselves—as they must if we only *keep on*.

Ah, those "results;" how anxious we are about them! Why do we not think, and realize that when the causes are once set in motion, the results are certain, by a law of automatic action? The trusted will is the motive power of assured desired attainment.

"I can't!" Shun those words and set to work to do the "impossible." Success is the goal of life; and we are sure to reach this goal, sure of overcoming every obstacle, if we persevere, and not, like cowards, give up at every least discouragement.

There are a few points to remember which lead to success. The first is Concentration—the very foundation of success. Then comes the spirit of Venture. Then the energy to Change, for everything must pass and give place to newer conceptions. The goal of success is not a stationary condition, but the recognition of Mastery, which is ours through a series of achievements.

Musicians of to-day find they have to discard many of the teachings of the old schools. They have to work in new ways, making entirely new experiments, since many of the old "discoveries" have not uncovered anything. New views are required. Our recognition must ever deepen and broaden—this is the only growth.

Can you not do some original work—follow your own ideals and promptings—rise above mere examples, precedent, what has been done in the past? True, there are historic records of many conquests and vast accomplishments, yet remember, that each was an original conception and creation. Be original! Certainly you may gather suggestions outside, but you must finally give heed to your own Intuition if you would express the spirit of genius.

Though after continual effort, there seems little to show but a series of "mistakes"—still work away; form different plans; every failure is a useful lesson, most surely guiding the way to masterpieces of workmanship. Only the every-day trivalities pass through without mistakes. In the early stages of masterworks there are times of "trial." And the end is worth it all.

TO KEEP THE PIANO AT ITS BEST.

Four Times a Year None Too Often to Have a Piano Tuned.

"There are plenty of people," said a piano tuner, "who let their pianos go one, two, three years without tuning, and in some cases pianos thus neglected may not get very woefully off, but a piano should be tuned every three months. That would be none too often to keep it in order.

"As a matter of fact a piano begins to get out of tune again at once after it has been tuned; how could it be otherwise? Nothing stands still. This difference would at first be so slight as scarcely to be perceptible to any but the practiced and sensitive ear of an expert tuner, but it is there. Doesn't a clock begin to run down as soon as it is wound up? Four times a year a piano ought to be tuned, but only a comparatively small percentage of people give their pianos that attention which is needed to keep them in their most perfect loveliness of tone. Piano makers and dealers, of course, are looking after the tuning of their pianos in stock scrupulously and carefully all the time. You don't hear pianos out of tune in a piano wareroom. They never let them get out of tune there. They aim in fact at keeping them as near perfection as they can.

"We are pretty sure to find in every new piano something pleasing and attractive. Some share, at least, of this pleasing quality comes from its being in perfect tune. In fact, to keep any piano at its best it must be kept in tune and to attain the results most satisfactory to all, to the owner and the neighbors alike, a tuning tonic should be administered to every piano not less than four times a year."

FOR THE YOUNG PEOPLE.

The Young Musicians' Perseverance Club.

Conducted by ARTHUR L. MANCHESTER.

There are several belated answers to the questions in April. The names are printed below:

Herbert Eckert. Emma L. Olmstead.
Ruth L. Simpson. Ethel C. Porter.
Margharita D. Harman. Florence A. Cross.

Now we come to the May story, and here are the answers to the questions, which accompanied it:

1. Evening song, or evening service.
2. Morning song, or service.
3. Altar boys, or lads newly admitted to the Monastery.
4. The Lord's Prayer.
5. A church.
6. Chimes rung by the monastery bells at evening.
7. Pope of Rome from 590 to 604 A. D.
8. Bishop of Milan about the year 384 A. D.
9. To the four tones of St. Ambrose he added four others, and also increased the collection of hymns.
10. A book containing the chants and *antiphons* that were sung in the services. Derived from antiphon, meaning response.

And here are the names of those who have profited by answering them.

Susie L. Schulze.	Bertha Jones.	Lorena Timmins.
Jeannie C. Davis.	Regina Mahoney.	Ava E. Miller.
B. A. Downey.	Ada R. Marsh.	Helen G. Johns.
Lydia C. Heller.	Bertha M. Irven.	Violet M. Smith.
Louise Foster	Helen Weber.	Mary Johns.
Eva Edmonson.	Mary A. Tierney.	Maud Busbey.
Annie Dornberger.	Dora Corell.	Mary C. Smith.
Helen Englerth.	May R. Keefer.	Alma Kernan.
Mary Frazier.	Louise Kefler.	Katheryn Landers.
Rosa Hoffman.	Marie Eldridge.	Leonide Timmins.
Margaret Hoffman.	Cora Overbaugh.	Liguori Hemler.
Jeannie A. Davis.	Estelle E. Keefer.	Regina Poist.
Louisa M. Darcy.	Camille Bunty.	Mary McCann.
Marabelle Jefferson.	Anna H. Coogau.	Anna M. Kinder.
M. Genevieve Overbaugh.		Annie Louisa Yantis.

Here is an examination paper of one of our Club members. I wonder how many take such examinations? It is a good thing to do. The paper is very interesting, as it shows a well diversified course of instruction. Study it, Club members, and see what you can learn from it.

EXAMINATION.

MISS CECILIA CLEARY. Age, 13 years.

SEVENTH GRADE, PART II.

Began music September, 1894.

Technics and Scales.—Mason's Touch and Technic: Vol. I—Two-Finger Exercises. Vol. II—Scales, Exercises 1 to 20. Vol. III—Arpeggios, Exercises 1 to 20. Vol. IV—Octaves, Etc., Sec. I.

Studies and Pieces.—Haydn: Sonata in G minor, No. 4. Heller: Art of Phrasing; "Erl King," Schubert-Heller. Chopin: Study on black keys; Waltzes, Op. 64, No. 2, and Posthumous, E minor. Bach: Fantasie in C minor. Schumann: Finale, Symphonique, "Bird as a Prophet"; "Sublime Sweet Evening Star," Wagner-Liszt; Serenata Moszkowski.

Review.—Bach: Gavotte, "Heart Ever Faithful," Prelude. Rondo Capriccioso, Mendelssohn; Sonata and Fantasia, Mozart, C minor; Czerny Study; Wollenhaupt Study.

Theory.—Lobés Catechism, nine chapters.

Average, 93.

ST. JOSEPH'S ACADEMY, MCSHERRYSTOWN, PA., March 1, 1901.

Mary is now beginning her first sonata by Beethoven.

Our letters are interesting this month. Among them is one from an old member who has come back to the fold.

We welcome our clubmate cordially and are glad of the spirit which animated those who were so thoughtful.

POMONA, FLA.

Dear Editor and Club Friends—Here I am on deck again. You have not heard from me for four months, and the reason is this: I had to stop taking THE MUSICIAN, and so, of course, could not go on with my club work. I was very sorry to have to stop but, by the kindness of two of my very dear club friends, I am enabled to be among you once more. I have gotten along extremely well in my music since you heard from me last. I am just finishing Beethoven's Sonate, Op. 7. I like it very much. I am also practicing some of Clementi's Studies and one of Kessler's. Two or three weeks ago I finished up Gounod's Waltz from "Faust." I like that very much. I like all my music; it seems more like playing "pieces" than exercises. I hope I have all the answers correct. Yours truly,

EMMA L. OLMSTEAD.

Perhaps we may print pictures some time. We have not received all photos yet.

Dear Mr. Manchester—I have been taking THE MUSICIAN for over two years and always enjoy reading the letters from the different members of "The Young Musicians' Perseverance Club." I always look up the questions on the Young People's page but neglect sending them in. I hope the few sent this month are correct. I am certain we all agree with Jeannie Davis in wishing you to put the pictures of the different members in THE MUSICIAN. I do, at least. Some of the music I have taken is "The Imperial," by Anthony; "The Golden Road," by H. Engelmann, and a "Valse," by Charles F. Dence. I like the small pictures in THE MUSICIAN better than the large ones. Wishing the Club success, I am, Your little friend,

MARABELLE JEFFERSON.

We are glad to have this writer join us. And we are proud that our Club members can take part in real contests. May our clubmate be successful.

CHICAGO, ILLINOIS.

Dear Mr. Manchester—I am getting so interested in my MUSICIAN that I thought I would write a letter and ask to be admitted to the Y. M. Perseverance Club, as I think perseverance is one of the things I greatly need. I received my MUSICIAN as a Christmas gift, but have been so busy in High School that I have not had time to study out answers to many of the questions. I have just entered a contest in the Balatka Musical College, where I take my lessons. We are all studying Beethoven's Concerto, Op. 15, No. 1. The last of June we play before several judges and a diamond medal is awarded to the one who executes the piece the best. Memorizing is very hard for me, and I wish other members of the Club would write and tell how they memorize to get the best results. Hoping I shall be accepted into the Club, and shall do as much "persevering" as many of the members seem to be doing, I remain, Sincerely,

ANNA-MAY BARTLETT.

Now we have one from New England. There are no rules. All you have to do is to write us each month and answer the questions.

WOODSVILLE, N. H.

Dear Mr. Manchester—I have been very much interested in reading the letters I find on the page for Young People. I have taken THE MUSICIAN for over a year and like it very much. I play a good many pieces in THE MUSICIAN. I am fourteen years old and have taken sixty-six lessons. I am now taking lessons out of a book called "Artist's Repertoire," No. 1. I have taken "Rondo Capriccioso," by F. Mendelssohn; "Melody in F," by Rubinstein; "The Brook," by Pape, and many others. I will try to answer the questions in THE MUSICIAN, and will you please send me the rules so that I can join the Perseverance Club.

Yours truly,

MAUD ELLEN PEASLEE.

We print the answers of this member in full. They are very well done.

OCONTO, WIS.

Dear Sir—Again an Oconto girl, a pupil of the much-loved "Sister Matilda" writes, sending the answers to the ten questions in the May number of THE MUSICIAN. I would be delighted to see my name among the list of those who send in the answers. I hope soon to take THE MUSICIAN and then will endeavor to answer the questions all the time.

Following are the answers:

1. Vespers is an evening song, or evening song in the Roman Catholic Church.
2. Matins is a morning worship or service.
3. Pater Noster is the "Our Father."
4. Angelus is a prayer to the Blessed Virgin, said by Roman Catholics.
5. Neophytes—a name given by the early Christians and still among the Roman Catholics, to such as have recently embraced the Christian faith and been admitted to baptism; also, more rarely to those newly admitted to the priesthood or into a monastery; a novice (according to Webster).
6. Basilica was, anciently, a public hall where princes and magistrates sat to administer justice. These edifices were at first the palaces of princes, afterward courts of justice and finally converted into churches. Hence, basilica now signifies a church, chapel or a royal palace.
7. Saint Ambrose was a Bishop of Milan, a Latin father and was born about 340 and died 397.
8. Saint Gregory I, the Great, was a Pope and was born about 540 and died 604.
9. He added to the Ambrosian chant, the plagal or collateral modes
10. Antiphonal or responsive singing, most ancient form of church music, and is said by the historian, Socrates, to have been first introduced among the Latins by Saint Ambrose. I am, Your future devoted Club member,

JEANNIE A. DAVIS.

TWO MUSICAL MISSIONARIES.

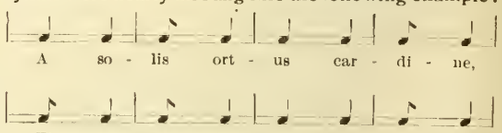
The clocks were striking seven as the travelers entered thro' broad gates into the streets of a city, which seemed on the eve of a festival, or Feast Day; pennons and streamers of purple floated from windows, or were draped across the houses, and the streets were filled with people, many of them hastening toward an immense temple or church, built upon a hill. Romanus and Petrus, the young monks, thought it well named, "The Cathedral of the Sun." Its spires and domes seemed to touch the gold of the sky; for it was just at sunset, and the broad band of yellow light lay behind the Church, which was dark, except for a little glimmering from lamps, high at the entrance. The street descending over the slope to the city was filled with the crowds, drawn back on either side, now, and kneeling and rising by turns as a procession approached, led by priests in long robes, the foremost bearing a banner of scarlet silk; across it were raised gilt letters forming the words in Latin:

His Throne as the Sun shall endure forever.

Behind the band of priests, walking five abreast, was a monk holding high a silver cross; then came a long train of choristers chanting the *Kyrie Eleison*. As the procession reached the entrance of the temple and the priests paused, bowing to the ground, then entering in single file, the choristers chanted in unison, "Keep Thou Thy wrath away from this city, and from Thy Holy Church, Alleluia!"

Romanus and Petrus were borne along in the crowd surging up the hill, and found themselves at last within the great temple, where the service had already begun. They gained seats at the side, in a little raised balcony not far from the altar, and could look out over the multitudes of people. Above the altar an immense gold ball represented the sun, and its brilliancy was so great that the eyes could bear its light but for an instant in glancing upward toward it. Two curved galleries, or inclosures, on either side the nave of the Church held the choristers, and they were now chanting the service antiphonally, using the hymns of St. Ambrose. Four musicians sat in the first row of each choir, playing the unison accompaniment upon tall harps, and at the long-drawn *A-men*, sung at the end of each hymn by the choirs in unison, all the harps were twanged in a curious wavering tremolo, the voices and instruments rising and falling together.

The hymns sounded strangely rhythmical, but they had no tonality; sometimes an odd attempt at the chromatic scale was made in the antiphons, but the hymns were nearly all sung like the following example:



Romanus and Petrus, fresh from the St. Gregory monastery, and raised in devout reverence of its creeds and discipline, sat stiff and erect in their long black gowns, listening in mute abhorrence to this old Ambrosian, and as it seemed to them, heathen service. They had heard that much of the world was as yet unacquainted with the Gregorian music, and that in places the barbarism of allowing instruments in the Churches was still permitted, and they knew, too, that missionaries, like themselves, were needed, and that this was why they had been sent forth.

The priests in their gorgeous robes were busy at the altar. A long, quavering *A-men*, at the close of a hymn, was followed by an interlude upon the harps, in which an attempt at a trill and a succession of double appoggiaturas brought the monks suddenly to their feet, while the right hand of Romanus, rigidly clenched, was pointed toward the choristers:

"Pagans! Blasphemers!" he shouted, and his voice rose clear, and trumpet-like above the twanging of the harps, while the heads of the astounded multitude of worshipers turned upward toward him at the sound. The music ended discordantly, the players gazing in alarm, and at the altar the priests suspended their rites.

"Is it not enough," cried Romanus, "that in all the ages past the idol-worshiping heathen have degraded God's best gift to man! Have ye not learned, oh blind, oh dull benighted ones, that in all these ages, sore was the affliction visited by that great Giver upon the ingrates, blaspheming in His Courts; the ancient Tartars, the Celts, the Gauls, the Scythians—how their temples were pillaged, destroyed, not one stone left upon another, their sacred groves laid waste, their profane instruments, upon which they had played as they 'sang and danced before the Lord,' scattered to the uttermost corners of the world!" He paused, breathless, Petrus standing, a still, mute figure beside him, looking down upon his clasped hands. There was perfect stillness in the Temple; dumbly, in sheer astonishment all were gazing toward the little raised gallery where stood the monks.

"In our own day," went on the speaker, after that moment's silence, "Rome has paid the penalty. Palaces, groves, churches lie ruined. Holy St. Peter's, where no instruments have ever sounded forth at sacred services, alone escaped. The psalms as chanted daily there, rise they not acceptably to the Divine ear, think ye, and from the great Pope's monastery upon the seventh hill as well? As David sang psalms on a harp to the Lord, so do we, too, sing, but on a harp whose strings are alive—our tongues are the strings; and more the Lord does not require. The only instrument we use is the voice. The Word, and the Word of peace, is enough for us. Let syrinxes be given to silly clowns, the pipe to superstitious men who pay honor to idols. Such instruments are to be banished from all sober company, and are more fitted for beasts than men. How entirely, then, must they be kept from the assemblages of Christians! Be far from us those pagan customs that corrupt the morals! St. Ambrose, in the North of Italy, before the time of our beloved Pope, attempted a common musical structure, but with neither skill nor abiding effect. Call him, if ye will, the 'father of the hymn.' Even so later, is St. Gregory the Great, as Pope of Rome, exalted, gifted, forever to be named as 'Father of the Chant!'"

Write the meaning of the following words:

1. Kyrie Eleison.
2. Alleluia.
3. Antiphonally.
4. Unison.
5. Tremolo.
6. Rhythmical.
7. Tonality.
8. Chromatic.
9. Trill.
10. Appoggiatura.

AMOUR DE PAPILLONS.

W. F. SIEP. Op.10.

Great delicacy, and clearness of tone is needed for the proper affect.

WOMAN'S PAGE

Conducted by Miss S. C. VERY.

WOMEN COMPOSERS.

Just one year ago, THE MUSICIAN inaugurated publication on this page, of short excerpts from musical compositions by women. From June, 1900, to the present time, these included selections by Alice Fletcher, Jenny Lind, Fanny Mendelssohn, Clara Schumann, Mrs. H. H. A. Beach, Kate Vannah, Adele Aus der Ohe, Stella Stocker, Liza Lehmann, Hope Temple, Agnes Zimmermann. It was unnecessary to quote Chaminade—the sensation of the time—with other brilliant women composers of France, to show work of feminine thinkers, approved and applauded. Only eleven were quoted and a bewildering number there is from which still to choose.

The phrases were chiefly from short piano pieces or songs. To lay emphasis on the custom, we enlarge the scope and hope soon to publish a portion of the score of The Gælic Symphony by Mrs. Beach. (The original MSS was passed among members of a class of women last Lent, and aside from its personal interest, proved its intrinsic value as an object lesson to many (unfamiliar with score writing), in necessity for change of clefs as above, with horns, clarinets, etc.—a new interest parallel with that shown in Year Books of 1901-1902, relating to Musical Instruments, to be mentioned later).

Activity among women composers in America is known, for it may be constantly witnessed. Not so is that of the women of Europe. Readers of Continental affairs, however, are aware of it, and to them the fact becomes daily more patent of constantly increasing activity in the field of composition; relative with quantity has quality improved, until a standard has been attained worthy of notice from leading artists. Mrs. Beach's violin sonata was performed last year by Carrēno and Halir in Germany, by Pugno and Ysaye in France. Liza Lehmann's reputation has become international by popularity of her work among choral societies. In May, we quoted a German woman's success. The recent journals from abroad write the following of a Russian woman's achievement:

"Miss Kaschperoff played a piano concerto of her own, although its opus number is only 2. The young composer is already favorably known by many works, not at all insignificant. In the concerto, there is so much that is individual, it displays such artistic earnestness, with intelligence commanding respect that many 'Lords of creation' might envy her originality."

In short, that which can not be ignored is commanding serious attention, and among notices of women's work, commendation is bestowed by critics hitherto indifferent, if not inimical. The careless statement of woman's inability to compose is disproved by fact, and the success guaranteed everywhere gives encouragement to all students. 'Tis irrefutable that with increase of knowledge in technics-of-composition, originality will find better expression; hence, the opportunities extended—not withheld as in those doors barred against her at the conservatory in St. Petersburg—having been embraced, prove the reiterated assertion that intellectual training, not emotional endowment, will be the *sine qua non* of future achievement. As these opportunities constantly augment, it is to be hoped, that dwarfed by no comparison, the best work yet is to be given by our women composers.

CLUB WORK.

THE WEDNESDAY AFTERNOON CLUB OF MARTINSBURG, WEST VIRGINIA.

This Club of West Virginia, organized in 1897, is accomplishing excellent work. The aim of its meetings, held the first and second Wednesdays of the month, is improvement of Club members. Its ambitious to possess a music room for public and private meetings is likely to be realized, as its systematic course of study, sustaining the interest of all, guarantees a speedy achievement of the desired plan. Beside the usual corps of officers, it has a program committee. Its members are active, associate and honorary. Two public meetings are held during the year, a custom identified with the most progressive Clubs. The past year's program of this Wednesday Club was as follows:

The First Classical Period, The Second Classical Period, The Romantic Period. These were subdivided into sections for a year's study, and thereto were added two miscellaneous chapters, one of which alluded to American composers. Papers were read on the History of Instrumental Music prior to 1700, The Era of Polyphonic Music; The Sonata Form; Wagner's Trilogy, and Sketches of Modern Composers. Vocalists and pianists contribute to the entertainment of the Club. We give one example of the Club's schedule, which is neatly printed on dainty white cards:

Wednesday Afternoon Club,
October 24, 1900.
Section B.
First Classical Period.
Bach, Haendel, Scarlatti.

Bach . . . . . Toccata in D minor.
Haendel "Angels Ever Bright and Fair" (Theodora).
Bach . . Deux Minuets (from sixth Sonata for violin).
Bach Prelude in C (from Well-Tempered Clavichord).
Bach Blute nur, du liebes Herz (Aria from Mattheus Passion).
Paper . . . . . Development of Polyphonic Music.
Bach . . . Bourree (from second Sonata for violin).
Haendel. . . . . Largo (Xerxes).

A CONCERT OF COMPOSITIONS BY MRS. H. H. A. BEACH, AT THE CHROMATIC CLUB, BOSTON, MASS.

Duets—(*a*) The Night Sea.
(*b*) Canadian Boat Song.
Piano Soli—(*a*) In Autumn.
(*b*) Dreaming.
(*c*) Phantoms.
(*d*) Fire-flies.
Scene and Aria—Eilende Wolken (Mary Stuart).
Violin Soli—(*a*) Romance.
(*b*) Mazurka.
Songs—(*a*) Chanson d'Amour.
(*b*) Extase.
(*c*) Elle et Moi.
Songs—(*a*) "Sweetheart, Sigh no More."
(*b*) "Take, Oh, Take Those Lips Away."
(*c*) "The Year's at the Spring."
Quartetts—(*a*) An Indian Lullaby.
(*b*) Three Flower Songs.
Piano Concerto—Op. 45 (first movement). With orchestral accompaniment. Arranged for second piano.

IN MEMORIAM. VERDI, SULLIVAN, NEVIN.

Musicale given by Music Committee of The Amherst Woman's Club:

Guiseppe Verdi:
Song—"Ah! I Have Sighed to Rest Me."
Sir Arthur Sullivan:
Duet—"Dance of Nymphs and Reapers."
Ethelbert Nevin:
Song—Doris (with 'cello obligato).
Quartet—"The Night Has a Thousand Eyes."

MATERIAL IN MUSICAL INSTRUMENTS.

When men, in formation of their musical instruments encountered laws of science and of nature, they evinced—women note with complacency—an interest and discrimination in material as keen as is the proverbial feminine instinctive love of fine texture.

Queer endeavors mark the history of brass instruments. To prove, for instance, that tone depends less upon density or thickness of metal or substance than proportion of parts, the great maker, Besson, put on exhibition as a test, a bugle of plaster, one of guttapercha and a cornet of paper, all of which could be sounded, and retained its tone quality when associated with other instruments. "You have read of the trumpets made of toughened glass blown in the streets of Florence during the Feast of the Epiphany, and one maker even made instruments of cheese, while those of earthen ware and marble are well known among the Chinese. So was the selection of material an important item in the long struggle of the musician for the especial tone-quality to be wrested from nature. Finally he selected brass. This is not a pure metal, but alloy of copper and zinc, as bronze is of copper and tin. Yet its pedigree is as ancient as is Tubal Cain's, that worker in brass and iron. The high-sounding cymbals of the one hundred and fiftieth Psalm may have been of silver, but the Turks had understood the mysteries of brass-making for centuries, and the invention of brass cymbals attributed to the Assyrians causes the belief that brass was familiar to the ancients long before the advent of imperial Rome. Chinese brass cymbals were familiar to the Chinese for thousands of years It was in the seventeenth century that Damascened work was so skillfully executed by the Persians, the specialty being brass inlaid with gold and silver wire and pierced, not dissimilar to the beautiful cloissoneé work in which the Japanese now excel. The best and purest brass is in most request for musical instruments, but note that science interferes by whispering secrets of a cheaper alloy with detriment to the tonal results, so that one writes: "Those who make best what we desire are those who dabble least in chemistry, leaving lead and other ingredients alone." Solid tubes of brass—an English specialty—outwit nature, for where seams are (soldering), the breath of the player on the mouthpiece has a destroying effect.

IVORY OF THE PIANO KEYS:

Have you ever noticed the little seam on the ivory key of the piano? 'Tis significant when one learns that every key of the scale must be formed from one and the same ivory tusk. There are distinct shades in tusks, as blueish white, yellowish white, etc. So the workman whose ambition is to turn out a perfect piece of work, eagerly selects at first the "head and tail" piece, so called, for 'tis hopeless after once mixed with others, to match again. At the New York factory of Strauch Bros., we were shown the loss experienced now and then in buying ivory. On the desk was an apparently fine tusk, which at the workman's attempt to polish, fell apart, revealing in its centre, a bullet; the elephant had been shot through the tusk, and the bullet had lodged there. Tusks weigh from three pounds up to one hundred and twenty-five and more. From the ivory left over after piano keys have been made, are tiny dice, paper cutters, etc., manufactured.

ASSOCIATIONS OF MUSIC.

Once upon a time we knew a schoolboy who, if he but chanced to hear an urchin blowing a whistle or playing on a Paris pipe on the street, would forthwith conjure up Sicily, Theocritus, Mount Ida and the Muses in a ring, wild thyme and the drowsy hum of Hyblaean bees, Syrinx and the old mythologies, with many a sweet old pastoral. Then he would hear the little boy piping sweetly under the great plane tree by the fountain of Callirhoë—the boy who, when asked where he learnt to play so well, answered with a look of wondering simplicity, that "it piped itself." He would also listen in reverie to the Genius in the Vision of Mirza, or to the sweet melodies of the Good Genius in "Vathek." He would hear Blake's happy Songs of Innocence, or the child piping in Sir Phillip Sydney's Arcadia, as if he would never grow old.—*Symington.*

MISS WESLEY'S MUSIC TREASURES.

By the will of the late Miss Eliza Wesley, of England, manuscripts of John Sebastian Bach and of Samuel Wesley have enriched the library of the British Museum. These formerly belonged to Clementi. After his death they passed to Mr. J. G. Emmet; his daughter bequeathed them to her friend, Miss Wesley. Two albums also, which contain photographs and autographs, are full of interest.

Mendelssohn's contribution is so characteristic as to be worth producing:

London, September 7, 1837. *Felix Mendelssohn-Bartholdy.*

The writer has the solution of the above and, trusting that American women will be interested in this theoretical puzzle, will publish if requests are received.

The Bach Festival at Bethlehem, Penna.

May 23, 24, 25.

FREDERIC S. LAW.

"Let us even now go to Bethlehem and see this thing which is come to pass."—Chorus of shepherds from BACH'S CHRISTMAS ORATORIO.

Some one has said that Bach, like Shakespeare, has a great future behind him. Certainly, one of the most striking features of modern musical life is the growing cult of Bach. During his lifetime, appreciated at his true value only by the elect few, in constant hot water with the petty authorities placed over him, after his death his music for the most part sank into oblivion. It is even said that a cupboard in the Thomas-schule

JOHN SEBASTIAN BACH.

was filled with his manuscripts, and when a boy wanted to wrap up his "Butterbrod," he tore off a sheet from these precious papers. The renascence of Bach's music dates from the performance of his Passion, according to St. Matthew, in Berlin, under Mendelssohn in 1829, precisely one hundred years after its first performance in Leipzig on Good Friday, 1729. This created such a deep impression that it led to the organization of the Bach Gesellschaft in 1850. This society had for its object the collection and publication of Bach's unknown and unpublished works. So great was the material which came to light that this work was not completed until 1900. It was then reorganized on a new basis—that of popularizing Bach's music and of instituting festivals for that purpose. The first of these festivals was held in Berlin, March 21, 22, 23 of the present year, in commemoration of the two hundred and fiftieth anniversary of the birth of Bach, which took place on the first of these dates. No great works were presented; the programs were largely made up of selections from the Church cantatas and the little-known humorous cantatas, the "Peasants Cantata," and the "Coffee Cantata." The second Bach festival, though not under the auspices of this society, was the one of which we write, by the Bach Choir of Bethlehem, under the direction of J. Fred. Wolle. This included Bach's three greatest choral works - the Christmas Oratorio, which received its first complete American performance on this occasion, the Passion according to St. Matthew, and the Mass in B minor, which was sung by the same choir for the first time in America, March 27, 1900. With fine poetic insight, Mr. Wolle produced them in the order named as presenting a trilogy illustrating the Christian religion. The first recounts the birth of Christ; the second, his passion and death; the third, his oblation and resurrection as symbolized in the sacrifice of the Mass. Their cumulative effect as thus given was convincing and logical. The symbolism was even carried out in the costumes of the chorus. In the Christmas Oratorio the ladies wore white; in the Passion, black; in the Mass, white or any light, gay colors.

Bethlehem is no stranger to music of the highest type. It was founded in 1741 by German Moravians; the fugue and chorale have long been household words in the families of their descendants. The Church in which the festival was held was built in 1803, and was then one of the largest auditoriums in the country. In it the first American performance of the "Creation" was given in 1811, eight years before it was sung in Boston. A well trained orchestra existed in Bethlehem as early as 1780, and many works by Handel, Mozart, Haydn, Beethoven and other great composers were heard there for the first time in America. Mr. Wolle was born in Bethlehem of a long line of Moravian ancestors and studied the organ and composition in Munich with Rheinberger. Returning to Bethlehem he brought out Bach's Passions according to St. John and St. Matthew, the greater part of the Christmas Oratorio, and finally, the Mass in B-minor. The triumphant success of this last production led to the scheme of presenting the last three works as a cyclus in festival form, and this scheme was carried to a triumphant issue. Bethlehem was filled with visitors, not only from adjacent points like Philadelphia and New York, but from as far west as Minneapolis and as far south as Baltimore. These visitors heard an admirably drilled choir of 110 voices sing three of the greatest choral works known to music, not merely in thoroughly satisfactory fashion, but with an accuracy and a brilliancy at times almost sensational. It was soon clear that this was no ordinary music festival with large means and mediocre results. This compact body of singers in a comparatively small auditorium produced an effect hardly to be gained by quadruple their number in a large music hall. Tnere was a flexibility, an instant response to the indications of their leader almost impossible to secure from a very large body of singers. There was a spirit of devotion to art, of religious fervor which could hardly be transferred to the concert room. The works were all written for the Church service and they were sung in a Church imbued with the sacred associations of three generations. The chorales, for example, which intersperse the Christmas Oratorio and the Passion, were intended to be sung by the congregation. The music was printed in the program book and the entire audience rose and joined the choir in singing them. This added infinitely to the impressive effect of both works, but would be impossible in any community where such chorales are not, as in Bethlehem, household words.

A grateful feature was the division of each work into two parts; one was given at four o'clock, the other at eight. At these hours the trombones, which act such a prominent part in Moravian musical life, gave the signal by playing chorales from the antique belfry of the Church. This division made it possible to give the works unabridged, which is hardly possible under other circumstances. The Christmas Oratorio lasted altogether nearly three hours and a half, the Passion almost four, and the Mass, about two hours and three-quarters. The soloists were: sopranos, Mrs. Mary Hissem De Moss, Miss Sara Anderson, of New York, Mrs. Marie Zimmerman, of Philadelphia; contralto, Miss Gertrude May Stein, of New York; tenors, Evan Williams, Ellison Van Hoose, of New York, Nicholas Douty, of Philadelphia; basses, Joseph Baernstein, Ericsson Bushnell, of New York, Henri Scott, of Philadelphia, Arthur Beresford, of Boston. The orchestra comprised sixty players, the greater part from Bethlehem and vicinity. The now obsolete *oboi d'amore* were lent by Frank Damrosch of the Oratorio Society of New York. In the Christmas Oratorio and the Mass, the original orchestration was followed, except that Mr. Wolle re-wrote the trumpet parts; in the Passion the arrangement by Franz was used. It cannot be said that the soloists were all on a level with their extremely difficult tasks. It must be remembered, however, that the Bach idiom is totally unfamiliar to the singers of the present day, and that at best it is hardly possible to gain more than a *succès d'estime* with many of the solos which occur in his works. The voice part is conceived on instrumental lines and the intervals are often difficult of intonation. Moreover, the voice is only one of several equal parts, all of which are treated contrapuntally, a style confusing to the singer accustomed to progressions of chordal harmony in which the voice takes first place. A few of the solos are more lyrical in character, such as the exquisite slumber song and quaint "Echo" aria in the Christmas Oratorio, the "Have mercy upon me, O God," in the Passion, the "Et in Spiritum Sanctum," and "Agnus Dei" in the Mass, with several others, but for the most part Bach's airs for solo voices sound stiff to modern ears. To thread his contrapuntal mazes with ease and sureness, the singer needs a firm, unfaltering sense of rhythm, an utter independence of the intertwining parts only to be gained by a thorough understanding of the structure of the composition. The orchestra brought together for this occasion, left naturally, not a little to be desired in the way of precision and accuracy of accompaniment, but this was inseparable from the conditions of performance. Only when the soloists and orchestra are brought together and given the same drill for days, or even weeks, that Mr. Wolle devotes to his choir shall we hear them in equal perfection.

The Christmas Oratorio is no oratorio, as we understand the term; it is really a series of six brief cantatas treating of the birth of Christ. In the time of Bach the Lutheran Church extended the celebration of Christmas, from Christmas Day to the Epiphany, and one of these cantatas or parts was sung on December

MORAVIAN CHURCH AT BETHLEHEM, PA.

25, 26, 27, the Sunday after New Year's Day, January 1 and 6. It is naturally lighter, more joyous and lyric in character than the other two works. The chorus work was wonderfully crisp and brilliant throughout; the spirited chorus in Part V, "Glory be to God," with its syncopated leads and sustained tones, was taken with a sureness of rhythm and accent almost startling. Mrs. De Moss sang the "Echo" aria very sweetly, with Miss Lucy Brickenstein, of Bethlehem, as an efficient echo. Miss Stein was sympathetic in the most popular solo number of the work, the charming "Slumber Song." Mr. Baernstein managed to infuse a certain dramatic effect into his recitatives, which was modern in character, yet not inappropriate, and added materially to the interest of his singing. Mr. Williams was in such bad vocal form that it must have been as great a relief to himself as it was to his audience when he sat down for the last time.

The second day was devoted to the Passion according to St. Matthew, the greatest of the three Passions which survive of the five which Bach wrote. Like them it is cast in dramatic form; the text of the gospel is declaimed by a narrator or Evangelist (tenor), the various personages—Jesus, Pilate, Peter, Judas, etc., are sung by different voices, but the chief significance of the work lies in its wonderful choruses. The keynote of pathos is struck, in the opening, "Come, ye daughters, weep with me," one of Bach's greatest inspirations, a double chorus treated antiphonally. To these is suddenly added a ninth part, the chorale, "O Jesu Christ, God, Lamb of God." This was sung in unison by a choir of one hundred boys, whose clear, silver tones threaded their undisturbed way through the agitated voices of the choruses calling one to the other with thrilling effect. From this number Mr. Wolle's choir pursued their way unfalteringly, keeping on the same high plane throughout. The short choruses, the so-called *turbae*, representing the populace, especially the bloodthirsty cry of "Barrabbas!" were delivered with a dramatic fervor and clearly cut outline which left nothing to be desired. Mr. Van Hoose acquitted himself admirably in the difficult and ungrateful recitatives of the Evangelist. In the evening Mrs. Zimmerman sang charmingly the air accompanied by oboes and flute, "For Love My Saviour Suffered." Mr. Bushnell, who sang the words of Jesus, knew his music thoroughly, but was exaggerated in sentiment; his pathos rang false, it was too often bathos. Mr. Scott, a new comer in this field, has a noble voice and his singing was characterized with earnestness and sincerity. Miss Stein sang the marvelously beautiful, "Have Mercy Upon Me, O God," with its throbbing violin obligato, finely played by Mr. de Verdier, with great feeling, yet dignity withal.

After hearing the Passion it would seem that the force of music as expressed in choral form could go no further. Yet, in his B minor Mass Bach shows us that even loftier regions are open to him. Spitta but expresses the feeling of its hearers when he says: "When we hear this mass performed under the conditions indispensable to our full comprehension of it, we feel as though the genius of the last two thousand years were soaring above our heads." The present writer can only say that for him it opens a chapter in the book of life—not merely a musical chapter, but one which seems to read into some of the mysteries of existence. It suggests the absolute, the illimitable; a little more and we might almost know whence we came and what our goal—why we live and why we die. It is the most difficult work of the kind in existence and cast in such a gigantic mould that, like Beethoven's Mass in D, it is out of the question for use in church service. Bach first wrote the Kyrie and Gloria and dedicated them to Frederic, the Elector of Saxony, on his accession to the throne, hoping to commend himself to the new ruler. The dedication was accepted but there is no evidence to show that they were ever performed in Dresden. Afterwards he added the remaining movements, some of which were given under his direction in the St. Thomas Church, at Leipzig, for, strange as it now seems, certain positions of the mass were then sung in Protestant churches and with the Latin text. No higher praise of choir can be given than to say that their singing was worthy of the music they sung. Incredible as it may seem, they were prepared to sing the entire mass without book. It was even proposed to sing it from memory, but this idea was wisely enough not carried out. As a mere *tour de force* it was out of place in a scheme of so much dignity and nobility. After three days' singing of the most exacting choral work in all music, it is not surprising that some slight traces of fatigue should be noticed now and then, but these appeared only in a few comparatively unimportant passages; when a climax was reached the singers rose nobly to the situation and were all that could be desired in sustained power and endurance. The deep pathos of the Incarnatus, the ineffably tender Crucifixus with its *diminuendo* to an almost inaudible *pianissimo* just before the exultant outburst of the Resurrexit, were veritable choral triumphs. But even these paled in contrast when, at the elevation, the Sanctus was sung. The effect of this wonderful chorus, in six parts, with its slowly moving triplets in the upper voices, like the wings of mighty angels sweeping the infinite blue, against the sledge-hammer emphasis of the descending octaves in the basses, beggars description. It is not surprising that the chorus completely dwarfed the soloists whose music moreover was almost exclusively stiff and academic in character. The exceptions were the Agnus Dei, exquisitely sung by Miss Stein and Mr. Beresford's "Et in Spiritum Sanctum."

Space is lacking even to mention all the questions suggested by these performances—questions of interpretation which assume great importance in connection with the popularization of Bach's music. It may be that they can be considered later in separate form. The artistic and financial success of this initial Bach festival leads to the hope that it may become a yearly feature in the musical life of Bethlehem, which some wag suggests shall be changed to *Bach*-lehem. Mr. Wolle's zeal and devotion to the highest ideals cannot be praised too highly. It is in the hands of musicians such as he that the advancement of musical art in America rests. May we have more of them.

J. FRED. WOLLE,
Conductor Bach Festival.

CHOIR OF BACH FESTIVAL AT BETHLEHEM, PA.

"That which is loveliest
Comes to the loving;
All that is strongest
The strong have for proving;
Gifts come the surest
To those who love giving;
They have life's best
Who have made life worth living."

MUSICIANS' EPITAPHS.

Old epitaphs are often so queerly commingled of the pathetic and the ridiculous that it is hard to determine which prevails. A recent traveler in England who had a fancy for deciphering antique brasses and haunting country churchyards noted among others—being himself of a musical family—three epitaphs upon forgotten musicians. The first was upon a trumpeter:

Till Angels' trumpets on the Final Day
Shall Blow, and Graves shall Ope,
Here Abram Crumpett In his Tomb doth Lay
And Waits the Call In Hope.

No less quaint is the second, upon a singer, a young woman who died at twenty-three.

Now from this noisy World releas'd
Of Shock and Strife and Sorrow eas'd
The Music of her Being ceas'd
In Silence softly she's deceas'd
Whose gentle Strains all Ears have pleas'd.

The last is also quaint, but it is pure poetry. Few travelers can forget, who have once looked down upon the simple slab in the shadowy multi-columned Lady Chapel of Durham Cathedral, perhaps with the sound of the organ stealing softly upon their ears, how beautifully an old-time organist is there commemorated. "Perfect epitaphs are rare," said of it one scholar and literary man, "even among those composed by famous poets; but this is perfect."

John Brimlels' Body here doth lie
Who praised God with Hand and Voice;
By Musick's heavenly Harmony
Dull minds he made In God Rejoice,
His Soul is now to Heaven lift
To Prayse Him still that gave the Gift.

VIOLIN STUDY—THE TECHNICS OF EXPRESSION.

GEORGE LEHMANN.

What a beautiful thing it is to be able to produce, on a violin, tone of the greatest richness and variety, strength and tenderness and refinement! What a truly wonderful thing it is that, by means of an instrument of such grand simplicity of construction, wordless expression of the deepest sentiment can be made intelligible to all men! The limitations of the violin—regarding it as sister to the human voice—are but the sad, sweet limitations of musical utterance. The player draws the bow, plays one phrase, and, in that musical sentence, communicates far more to the human heart than the subtlest spoken language. And this utterance does not, as you may imagine, merely reveal the player's depth of sentiment and thought, and demonstrate the peculiar powers of music itself. It means something more than this. It means that the promptings of the heart and the workings of the mind require a perfect communicating agent if they are to be revealed through the medium of musical expresssion. This perfect communicating agent is too often confounded with Nature's glorious heritage to the fortunate few. It is a possession which comes of knowledge, high purpose and perseverance. It is the knowledge of the technics of expression united with the physical skill to reveal that knowledge. While it cannot compensate for Nature's denial of musical gifts, it is an all powerful, indispensable agent, through whom these gifts can be proclaimed.

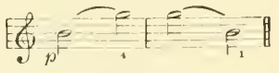
Any inquiry into, or discussion of, the technics of expression, must naturally begin with the question of tone-modulation. Strange as it may seem, the novice usually imagines that the *vibrato* is the chief factor in tone-beauty—that the acquiring of it signalizes the player's victory in the technics of expression. This is as far from being the truth as the belief that the player imbues his work with warmth and delicate fancy merely because he feels and thinks as he does. The results of this grave misapprehension are manifest in the playing of too many of our violinists. The innumerable delicate nuances of which musical expression admits, and whose mastery evidences the highest artistic skill, are either feebly appreciated or utterly ignored. These tone gradations are the very essence of musical beauty, and it is the study of these that really constitutes the study of the technics of expression.

It must not be understood from this, however, that to the bow alone is assigned the difficult task of producing every shade of musical thought and feeling. The fingers, too, play their part in the technics of expression, though that part is necessarily a minor one. The brevity of this article naturally precludes the possibility of sifting my subject with anything resembling the thoroughness which it deserves, but it is nevertheless, possible, even with the restrictions of space under which I labor, to give my readers a profitable glimpse into an art which, unfortunately, has too few intelligent devotees.

The art of nuancing, or varying tone, is chiefly dependent upon control and manipulation of the bow. If the bow is drawn from heel to point (on the open A string, let us say), with absolute evenness of speed and pressure, and in a parallel line with the bridge, the resultant tone will be satisfactory, in at least one respect, to the most critical ear. That is, if the conditions which govern the production of pure tone are rigidly adhered to, the tone thus produced will be marred by no imperfections, and, on this account, will prove satisfactory to some degree. Such tone being absolutely colorless, however, it would seriously offend the sensitive ear were its character to remain unchanged throughout the performance of many measures. Often some special musical reason restricts the player to the production of unvaried bow-tone (as, for instance, when it is required that certain measures be played either *piano* or *forte*, unrelieved by dynamic changes); but even then, oscillation of the finger, or what is termed *vibrato*, comes to the rescue with its vitalizing power, and the ear is more or less pleased. If under such conditions, however, the *vibrato* is not employed, the ear could not long remain pleased with the character of tone produced. (In order to avoid possible misapprehension regarding the two distinct sources of tone-effect, I employ the term, "bow-tone," when I refer to tone which results from manipulation of the bow and "finger-tone," when the character and variation of tone are the direct result of digital effort).

The mere statement that the fingers play an important part in the technics of expressisn, will not be readily believed or understood by most young violinists. I hope, however, that the following illustrations will convince all unbelievers that some of the credit of a warm and beautiful tone is due to well-trained fingers:

Draw the bow carefully, in the above illustration, with unvarying pressure and speed. Is the tone, thus produced, either a warm or sympathetic one? Now, without making the slightest change in the stroke, employ the *portamento*—that is, play the same notes with the very same manner of stroke, but with different fingering:



What a difference in tone results from this mere change of fingering! In the first illustration, the tone is pure, but absolutely cold and lifeless; in the second, this cold, uninteresting tone is transformed into a warm, sympathetic one, by the exceedingly simple process of ascending to the third position on G, and returning to the first position on B. Simple as this process must seem to every player of the instrument, its achievement, together with its exposure of the vital principles which underly the art of tone-production, will surely prove a revelation to all those who have never given the technics of expression serious thought.

But we have not yet finished with this illustration. It should be clearly understood that such a change of position, wholly unaided by any other effort of the finger, is responsible for this transformation of the character of tone. The necessary pressure upon the string, and precision in changing from one position to another, are the only duties which the fingers are called upon to perform in making this experiment. No aid, in the form of *vibrato*, is required of the fingers, nor does the bow render assistance in the slightest degree.

The illustration fully serves my purpose. The intelligent player will surely be convinced, by making the experiment suggested, that tone-beauty and warmth of expression are not necessarily the result of rich endowments and musical temperament. It will be seen that much of what is commonly believed to be temperamental warmth, is little more than knowledge of mechanical possibilities, combined with technical skill which is the reward of patient endeavor and investigation. Numerous similar illustrations would only serve the purpose of strengthening the evidence presented, and for this our space is too limited. Besides which, we have yet to get a glimpse of what the bow, by purely technical means, contributes to musical expression.

The technical demands which the higher art of violin-playing makes upon the bow (or, more properly, the wrist), can scarcely be appreciated by those who have no practical knowledge of the violin. It is commonly supposed that such subtle strokes as *staccato*, *saltato*, *spiccato*, etc., are truly representative of artistic aim. While it is certainly true that the difficulties which beset the acquirement of various strokes are prodigious, it is none the less true that these very bowings have more to do with the art of ornamentation pure and simple, than with the art of expression in its relation to beauty of tone. Indeed, with the possession of much instrumental skill comes always the realization that what is most worth striving for and most difficult to attain, is that superb control of the bow which enables the player to graduate tone to the utmost perfection. This graduation of tone is the chief factor in the technics of expression. It is the study of a lifetime. The young player does not recognize the technical means employed, when he listens to the artist's beautiful tone with all its wonderful gradations. His sigh of despair is caused by the thought that such beauty and perfection of tone have nothing in common with human acquisition. As he grows older, in years and in art, he learns that it is possible to acquire by technical means, much, if not all, of that which resembled an inheritance from Nature.

Control of the technics of expression enables the player to travel the greater part of the distance on the journey to high artistic achievement. The apparently simple studies of tone gradation with which most students are familiar, represent the surest means of reaching the artist's goal; but it is these very studies that suffer most neglect, for they are less understood than all the other technical branches.

THE VIOLIN AND VIOLIN STUDY.

E. N. TREADWELL.

The Violin is the most sensitive, the most sympathetic, the most subtle medium of expression found in the large family of stringed instruments. This classification is larely and equally true of its great-cousin—the 'Cello. To the delicately attuned ear and sensitive finger the violin really reflects a marked personality. One might almost say that violins are capricious. They give off a thin, rapid tone in hot, dry weather, and a muffled, murky tone in wet weather. Their peculiar susceptibility to atmospheric change, shows that their organizations reflect, as does man's, all untoward conditions.

Violins seem to invite or repel handling by certain players. It makes no difference whether your violin is a five dollar "trade-fiddle," or one scientifically and beautifully put together and costing up into the hundreds or thousands, the organic peculiarities are equally manifest in both grades. All violin players, natively endowed, are conscious of this violin peculiarity. I will go farther! Violins have their personal affinities in the human family.

A player, born under Taurus, will play a given violin and the best it will give him is a squeak, a squawk or a rattle. He flings the thing down as "utterly no good." Clever fingering and bowing alters not the result.

A Virgo man present picks up the violin, stops a beautiful chord, thrums it, and lo, the effect is charming. The rapport is plainly apparent. He draws the bow across its strings, swings into some captivating melody, and the effect upon the listener's ear is one of peace, calm, love. Both were skilled players. Taurus was repellent to that violin's temperament. Virgo was its affinity. Often fine players are known to part with good toned instruments and people are surprised. The player is not suited to the instrument. He is likely to make many changes, till one day he finds a violin that responds to his every touch, to the lightest thought. It is his Affinity, his Love!

One temperament demands the smooth, oily, cloying quality of tone. Another temperament is dependent for its satisfaction upon the sharp, brilliant, piercing quality. Another make-up desires the flat, reedy, nasal, oboe quality. Each searches till he finds their affinity. Like attracts like, between violins and players, as it does between men and women.

To select a violin whose tone is suitable to one's native rate of vibration in tone and color is no small task. It requires a nice judgment. A high grade violin in the hands of a player often gives off an indifferent tone.

A "trade-fiddle," in the hands of a soulful player, can be made to charm and hypnotize by its tones. Adaptability between player and instrument is very important.

The violin being the most sensitive of instruments, the question naturally suggests itself, "Who are fit subjects to study the violin?" Twenty years' experience as a violin teacher handling, at that time, students who have represented all sorts of temperaments, and ranging in age from six to sixty years, I came to this conclusion: Half of the number now studying the violin in America should give it up and prosecute piano study. And, farther, half of the piano students should drop that instrument and take up violin study. Why? Allowing that both of these classes of students are endowed with an exact sense of correct time division, there nevertheless remains a requisite to acceptable violin playing of first importance; *i. e.*, correct instruction! Inability to instantly recognize the difference between A flat, A natural or A sharp clearly bars, in my opinion, such a person from violin playing. Many write of training these defective ears' Yes; they can be improved to an extent.

Such an improved musical hearing seldom ever reaches the aural detective of the originally correct ear. I say, Never! What are you going to do with those people? They want to give expression to the emotional side of their natures, through some musical channel, just as much as more liberally endowed folks. You don't want to bar them entirely? No! Let them go to the instrument whose instruction is manufactured, marked, graded and divided for them by separate keys or stops. They are automatic and mathematical enough to locate a division on the piano keyboard by the eye. Assuming that they can find A natural on the piano keyboard, when called for by the music and having pressed the key down, we can then

draw a long breath of relief, for we "*know*" that, by no possible twist of the wrist, can they transform it into A flat.

In this realm they can neither offend the musical hearing of the members of their own family, the boarders across the hall nor the neighbors in the next block by playing out of time.

Clearly then we have done the student, the teacher and their joint local community a great service in the exchange of instruments. In many respects such a student might, in the hands of a thorough piano teacher, blossom into an acceptable piano player. There ought to be a National Government examination of all intending violin players. All teachers, both private and in schools should, for the well-being of student and community, put all applicants to the test. Make them locate pitch. Having satisfied this requirement test their idea of time division. If they see no difference between "sixth-eighth pulse" and "four-four pulse," then kindly and pleasantly suggest that they turn to carpentering, blacksmithing, hoeing, driving, dry goods, or anything other than violin playing. Thus would we spared the excruciating vibrations of amateur orchestras and thereby confer a national benefaction.

The piano, with its brilliant effects and glorious harmonies, is an alluring expression. Oh, for a board of experts to pick out subjects for its use.

The are numerous students, on the other hand, who are doing from two to six hours a day practice on the piano, because "it's the fashion," or because mamma wants it, when all this time their soul could speak freer through the violin. Oh, for some one to step in and bring about the change!

You can experiment, invent, practice and, apparently, bring to perfection all the improved pedals, frames, strings and cases composing the modern piano, and yet not have at your command an instrument that gives the long, smooth tone of the violin, which is the natural counterpart in quality of the human voice. Why? Because, first, last and all the time, the piano is an instrument of percusssion.

If you were going to sing your love to a girl, you wouldn't "percuss" it! No! You would frame it! You would bind, connect and "slur" it into one melting and sustained phrase, which would really make her girlship melt. This is possible with the bow. Of course, some girls have to be awakened by percussion, in which case you can fling off some staccato or ricochet effects with your bow, or possibly use the piano for the purpose. Schumann, Chopin and a lot more musical fellows here sung their loves on the piano and successfully, but they were star-beaters. When it comes to "real singing" I think the violin tops them all, just a little bit. Music schools should see to it that their examiners have ears as acute as those of the Indian and deer.

THE POWER OF THOUGHT.

It is a simple psychological law that any type of thought, if entertained for a sufficient length of time, will, by and by, reach the motor tracks of the brain, and finally become expressed in action. In the realm of our own minds we have absolute control, or we should have, and if at any time we have not, then there is a method by which we can gain control, and in the realm of thought become thorough masters.

Let us consider that law of the mind which is the same as is the law in connection with the reflex nerve system of the body, that law particularly familiar to piano students, which says that whenever one does a certain thing in a certain way, it is easier to do the same thing in the same way the next time, and still easier the next, and the next, and the next, until in time it comes to pass that no effort is required, or no effort worth speaking of; but on the contrary, to do the opposite would require the effort. The mind carries with it the power that perpetuates and makes continually easier its own particular acts. Thus a simple effort to control one's thoughts, a simple setting about it, even if at first failure is the result, and even if for a time failure seems to be about the only result, sooner or later, will bring him to the point of easy, full and complete control.

Each one, then, can grow the power of determining, controlling his thought, the power of determining what types of thought he shall and what types he shall not entertain. For let us never part in mind with this fact, that every earnest *effort* along any line makes the end aimed at just a little easier for each succeeding effort, even if, as has been said, apparent failure is the result of the earlier efforts. This is a case where even failure may be called success, for the failure is not in the effort, and every earnest effort adds an increment of power that will eventually accomplish the end aimed at.

And here we must say a word regarding a certain great law that we may call the "law of indirectness." A thought can be put out of the mind easier and more successfully, not by dwelling upon it, not by attempting to put it out *directly*, but by throwing the mind on to some other object, by putting some other object of thought into the mind. This may be, for example, the ideal of full and perfect self-mastery, or it may be something of a nature entirely distinct from the thought which presents itself, something to which the mind goes easily and naturally. And this may quickly be made in turn the absorbing thought of the mind.

There is nothing more true in connection with human life than that we grow into the likeness of those things we contemplate. Literally and scientifically, and necessarily true is it that "as a man thinketh in his heart, so *is* he." The *is* part is his character. His character is the sum total of his habits. His habits have been formed by his conscious acts; but every conscious act is, as we have found, preceded by a thought. And so we have it—thought on the one hand, character, life, destiny on the other. And simple it becomes when we bear in mind that it is simply the thought of the present moment, and the next moment when it is upon us, and then the next, and so on through all time.

One can, in this way, attain to whatever ideals he desires. Two steps, only, are necessary; first, as the days pass, to form one's ideals; and second, to follow them continually, whatever may arise. Thought is the foundation of all progress or retrogression, of all success or failure, of all that is desirable or undesirable in human life. The type of thought we entertain both creates and draws conditions that crystallize about it, conditions exactly the same in nature as is the thought that gives them form. Thoughts are forces, and each creates of its kind, whether we realize it or not. The great law of the drawing power of the mind, which says that like creates like, and that like attracts like, is continually working in every human life, for it is one of the great immutable laws of the universe. For one to take time to see clearly the things he would attain to, and then to hold that ideal steadily and continually before his mind, never allowing faith—his positive thought-forces—to give way to, or to be neutralized by doubts and fears, and then to set about doing each day what his hands find to do, will sooner or later bring about the full materialization of that for which he sets about.

There are those who, when they begin to grasp the fact that there is what we may term a "science of thought," who, when they begin to realize that through the instrumentality of our interior, spiritual thought-forces, we have the power of gradually moulding the every-day conditions of life as we would have them, in their early enthusiasm are not able to see results as quickly as they expect, and are apt to think, therefore, that after all there is not very much in that which has but newly come to their knowledge. They must remember, however, that in endeavoring to overcome an old, or to grow a new habit, everything cannot be done *at once*.

In the degree that we attempt to use the thought-forces do we continually become able to use them more effectively. Progress is slow at first, more rapid as we proceed. Power grows by using, or, in other words, using brings a continually increasing power. Every act and advancement made by the musician is in full accordance with this law. No one commencing the study of music can, for example, sit down before the piano and play the piece of a master. He does not conclude, however, that the piece of the master *cannot be* played by him, in time, or, for that matter, by any one. He begins eventually to practice the piece. The law of the mind that we have already noticed comes to his aid, whereby his mind follows the music more readily, more rapidly, and more surely each succeeding time, and there also comes into operation and to his aid, the law underlying the action of the reflex nerve system of the body, which we have also noticed, whereby his fingers coördinate their movements with the movements of his mind more readily, more rapidly, and more accurately each succeeding time; until, by and by, the time comes when that which he stumbles through at first, that in which there is no harmony, nothing but discords, finally reveals itself as the music of the master, the music that thrills and moves masses of men and women. So it is in the use of the thought-forces. It is the reiteration, the constant reiteration of the thought that grows its power, and that finally brings it into manifestation. The life of every one is in his own hands and he can make it in character, in attainment, in power, in influence exactly what he wills to make it.—*Adapted from "Character-Building Thought Power."—Trine.*

ACCOMPANYING.

CAMILLA URSO.

To accompany well requires first, good technique; second, profound forethought. It is not only to play notes on time, it is to grasp the ideas of the composer as interpreted by the soloist; it is also to infuse life, grace, enthusiasm, coloring for what is meant to be a beautiful tone picture. A most important qualification for an accompanist is the proper and judicious use of the pedals and to observe the composer's demands. If he places marks meaning forte or piano, fortissimo or pianissimo, why ignore them? The lack of attention to these is the cause of the monotonous, colorless, insipid rendition one hears so often in concerts and drawing-rooms. It is sure death to artistic success; the singer or performer must be sustained in his efforts, and if the requirement of the ensemble calls for mezzo forte (m f), forte (f), or fortissimo (f f f), the composer's ideas should be severely followed; he has thought of the effects! The accompanist must not be afraid to use the loud pedal. When an orchestra of fifty or more men give the accompaniment to a soloist, singer or instrumentalist, they produce a far larger volume of sound than a piano. At times the soloist is hardly heard, being lost in the ensemble; the effect of the whole is to render the conception of the composer.

Many times I have heard complaints that the pianist played too loud. These remarks were often unjust toward the accompanist. Imagine, for instance, that song of songs, "The Erl King," accompanied by a pianist afraid to use the loud pedal; it couldn't be tolerated. Therefore, my advice is to aspirant accompanists who wish to make a mark: Follow the soloist in all the diversity as expressed and marked by the composer. All experienced and noted accompanists use both soft and loud pedals incessantly. They are musically sustaining in their effects, give coloring otherwise unattainable, and are, in fact, the quintessence of that beautiful art, faultless accompaniment.

AS OTHERS SEE US.

E. W. MUNSON.

"I *do* think musicians are the meanest people." Such was the remark of a lady, herself an amateur of no small ability, after attending a rather stormy session of a ladies' musical club, during which the spirit of envy and jealousy most certainly predominated.

Hastening to defend the musician her hearer replied: "Yes, some musicians are mean, but not all are. I know many cases where musicians have a most generous spirit of admiration for each other, and I think the greater the musician the more free he is from petty jealousies, the more generous he is in his estimate of his brother artists and the less he is inspired by a spirit of carping criticism."

This conversation, overheard on a street corner, furnishes food for thought.

Are musicians, as a rule, any more than the members of any other calling, animated by a spirit of envy, or is the profession much maligned?"

It is considered very bad form for one physician to speak ill of another. When we hear another doctor call another a "quack," we instinctively feel that the code of professional ethics has been violated. Yet a conversation with a musician rarely progresses very far before we hear a slighting remark concerning the work or the methods of some other member of the fraternity. There is room for improvement along this line. A dignified silence regarding your competitor is far better than abuse. If his methods are not so good as your own the public will, sooner or later, find it out, for, as was once said by one of America's great men, "You can fool all the people part of the time and part of the people all the time, but you can't fool all the people all the time."

When you are asked to give an honest opinion concerning the work of another do it by all means, but do not descend to petty envy and jealousy.

THE VOICE.

MR. FRANK HERBERT TUBBS, Associate Editor.

With this issue we begin a series of answers to inquiries. We have been running a series of articles of a pedagogic nature from which material for study has been derived. Now we purpose giving a very practical trend to this department by answering questions sent us by teachers and students. This first instalment shows the helpful character of this department. We will welcome inquiries from all who desire help.—Editor of THE MUSICIAN.

INQUIRER'S DEPARTMENT.

FRANK H. TUBBS.

How Can One Acquire Distinct Speech in Songs?

Select, in the first place, songs which are within easy range of voice. Until a voice is well trained it is not easy to speak distinctly on the high or the low notes. Songs which have a story to them are the best on which to acquire good speech. Many songs are but advanced vocalizes, written for the display of the voice, and it will be difficult for any one other than a very good singer to have his words understood when singing such songs.

Writers have said, "He who speaks well sings well," and this remark indicates that the whole of singing is contained in acquiring distinct speech in songs. There are teachers who say that certain vowels cannot be gotten when singing and the Italian teachers have chosen to assert that no one can pronounce English words in singing. They are wrong for, if the voice is correctly trained, English words can be perfectly delivered. How to become able to do it? By training from the very start the organs of speech. These are tongue, jaw, lips and face.

The training of the tongue is intended to secure perfect freedom in tongue action. Practice making tones with "Ah" until the tongue ceases to jump and contract with every start. Then make tones with other vowels, all the time securing the freedom of the tongue. This is not with reference to tone production but for the preparation of the tongue for distinct speech. Release of the tongue helps to secure the unconstrained action of the jaw. Few students understand what an unruly organ the jaw is. At least three things affect it: stiff tongue, inactive lips and unhappy face. If the jaw is rigid it is almost impossible to speak well. Why does it get rigid? Ask the boy when he is doing someting requiring exertion why he grits his teeth and braces his jaw. He cannot tell, but you can know it is because all the labor of the body is concentrated upon the jaw. When the face has a fixed expression the jaw will be set. Therefore, relax the face into a smile. These are the means of getting the organs which act directly upon speech ready for their duties. When they are ready use them. Select any easy sentence and say it on single notes. Any sentence will answer, but a student left to do it by himself will not select one, so here is one: "Let the People Praise Thee." That is not an easy one, as a student who knows how to examine himself will quickly find. It will not show its difficulties in the pitch of voice on which we carry conversation—that is, from D to G—but above there it will be found that the letter "p," which comes in two words, will cause the set feeling until it is worked out. When one gets tired of that take another sentence. "The Lord is My Shepherd" is a good one. A line of poetry like "Ring Out, Wild Bells, to the Wild Sky," or "The Lark is Singing in the Blinding Sky" is most excellent. One may say that this is elocution. It is, indeed, but the foundation of speech is the same for the art of the elocutionist and the singer. We depart from the usual practice of the elocutionist, however, when we place our sentence on melodies. The sentence given above may now, in place of being sounded on single notes, be sung up and down the scale. Important words may be given stress. That is accent. Such practice is really song singing. After one feels easy in it he should take up a song and use its words on the melody in exactly the same way he has used the sentences. Remember the preparation of the organs and then the use of the sentences. An hour of such practice will enable anyone to take up his songs with comfort and he will realize that his speech is clear-cut and distinct. If such practice is persisted in a little each day, in a few weeks all songs will become distinct in words. Certainly, if we do not speak so as to be understood, friends do not like our singing.

What is Meant by Covered Tones and When Should They Be Used? Are They Present in the Voice or Acquired?

In the unculivated voice there is always throatiness in the upper voice. The beginner always makes resistance when singing. This, to many theorists, seems to be a natural thing. They find it present in all voices, and jump to the conclusion that it must remain in the voice. One effect of this strain is upon the pharynx. The muscles, which run up the neck to the head, and especially those which pass directly by the larynx and run up to the chamber in the back of the mouth, are the ones which take most of this resistance. One can see in the mirror, if he looks into the open mouth, an arch whose pillars stand out into the mouth just where the hard palate ends. These pillars are muscles which come up from the neck and are are always under contraction in the untrained voice. In their tension they make resistance to tone rising from the larynx and deflect it back into the soft palate and nasal chambers. These parts (the folds of the soft palate) contract to meet the tone and enfold the tone; or, they envelope it; they arch upon it. Tone sung into this arch or dome has a somewhat rounded effect much liked by many people. To others, and this class includes the most cultured thinkers, the tone thus "domed" or "covered" has a resonance which is smothered and inefficient to express emotion in artistic manner. To this latter class, and all like to think we belong to it, tone which is intentionally covered is artificial and therefore inartistic. So, we would answer the question as to when they should be used by saying, "Not at all."

However, may there not be place and purpose for them? There are so many good teachers who use them that it would seem there must be good in their use. Garcia taught them, but much modified from what many others do. His instruction to the writer was "less open tones, placed far forward in the lower part of the voice; begin to cover at about A and B and cover more as you ascend." In his way the effect was to produce a smooth and round tone of limited compass. He carefully avoided all exercise practice on the highest and lowest notes of the voice. "Those are pearls," he said; "take them out on e in awhile and show them to your friends, but don't have them about all the time." The student, under this training, found himself unable to use his extreme notes when he most wanted them. They were hard to train and uncertain all the time. The basis of that calm and beautiful tone of the artist lies in the consciousness that it is good and sure. A method which leaves distrust is open to reproach. If the students of the great Garcia experienced trouble, what would we have reason to expect from those of teachers less experienced?

Lamperti, who shared with Garcia the highest honors given men in our profession from 1850, nearly a half century, took quite an opposite view on this question. To him a "covered" tone was sombre. He used the words which mean "sombre" and "bright" where most persons say "covered" and "open." He thought the sombre tone should not be used for practicing. Among his reasons were (1) that it hid defects; (2) that it limited compass; (3) that it interfered with articulation. If these things be true the indictment is severe and decisive. From the physiological point of view there is scientific ground for saying that Lamperti had a good case. But it led many of his students (and teachers as well) to fall into the error of producing "white," "blatant" or "bleating" tones. This was the extreme, indeed. Now, any tone which can be ascribed as "white," etc., is weak and worthless.

Is there a happy medium? Compromises are always unsatisfactory and ineffectual. If one would be faithful to the moderate ways of either Garcia or Lamperti he would be about right. The problem from either starting point settles in this way: From Lamperti, working on the bright tone, the completely cultivated voice presents roundness, lovely quality and beauty; from Garcia, working from the covered upper tone, the completely cultivated voice has warmth, velvety vibration and beauty. "All roads lead to Rome." If a compromise were permissible it would be that students should work upon open tones, high as well as low, until the tone is well and definitely established. Then permit the covered tone in the upper half of the voice to be employed but never made so as to cause a throaty quality. Even if all exercise practice were done in the bright voice (Lamperti's way) the singing of songs would draw us into a little of the covered voice (Garcia's way). The deeper and more heartfelt the emotion the more covered the tone. This would answer the last part of the question which heads this article, that covered tones are present in the natural voice, but they cannot be used to the best advantage in exercise study and can be brought out to excellent purpose when song singing is developed.

Why Cannot One Sing Well Immediately After Dining?

Singing is an art which calls into use the whole of the body. Rather, it employs the various systems which are combined to make the body. After eating heartily the work of the various systems is demanded in reducing food supply to the condition needed to reconstruct tissue. The digestive system is assisted by the circulatory and the nervous systems. When food is received these two immediately rush to aid digestion and they neglect other work for the time being. They cannot do two things at once. The nervous system is needed is very much in singing. Transmission of tone is upon the magnetism supplied by the nerves. If the nerves are sending off their supply for digestion they cannot, at the same time, supply material for transmission of tone. Singing, therefore, soon after eating is labored. Tone lacks vibration and good ring. Many people suppose the cause of labor at such time is from inability to take deep and extensive breaths. This is error. Although one may not take much breath then, he does take enough for singing purposes. It is not a matter of breath, but is connected with nerve supply. This is shown by anyone who wants to test it by taking, at the close of the meal, some active stimulant like cordial or champagne. The activity of the stimulant helps digestion so much that the nerves are not so fully called into action. It is then more easy to sing than usual. The quantity eaten may in all cases be the same. Gentlemen who sing at banquets have often spoken of the ease with which they could sing if they used a glass of wine at dinner.

We do not point this out as a resort to which singers may turn, but as proof that the food supply, interfering with the freedom of inspiration, is not the cause of difficult singing, but that it is because the nerve and blood forces are busy. It is better to wait until they dispose of the food, which takes them an hour, generally, before we ask them to do other work.

My Income is Too Small to Let Me Take Singing Lessons. Can I Learn to Sing by Myself So as to Become a Good Church Choir Singer.

This question comes from a young man in a large town in Iowa. He describes his voice as tenor; he is twenty-one years old; has good public school training. The following reply is influenced by his data, but it may be fitted to many cases by a little adjustment.

There are many men and women singing in church choirs who have never had any lessons from a teacher. They have good, natural voices, have learned to read music and have the faculty of adjusting themselves to other people so that they can balance the quartet, if they sing in quartet choirs. But such singers cannot obtain places in choirs which are musicianly and they cannot aspire to large salaries. They must forever remain mediocre.

It is possible that some readers will wish to dispute the ground taken and it may be well to give reason for the above opinion. The three essentials for good

choir singing are good and well-trained voice, facility in reading music and artistic rendition. A singer who has never had lessons will never have a well-trained voice. By following suggestions, such as our magazine has, one may improve himself, and it is all that it is expected the printed page can do anyone. Voice culture is too subtle a study to have its fineness pictured in print. There are hundreds of leadings which come from a teacher which cannot be given in print. These leadings, the influences of the teacher, are the most important thing we have when taking lessons. The exercises, vocalizes and suggestfons are helpful and can be used to advantage up to a certain point, but then is wnen the teacher must be appealed to in order to carry the singer over the road to being an artist.

The idea given above suggests that we cannot tell in print what the teacher gives his pupil. Students often wonder after a lesson what there was in that lesson. Almost nothing which could be described. Yet the student feels as he goes away that he is carrying something which makes him better and which takes him one step nearer being an artist. Perhaps the teacher "teaches" sight singing. That is something which can be given completely in print, but it is not easy to learn alone how to read. A teacher, and association with other students, give something not in the books. It is a mental stimulus and it brings success.

Is it Not Injurious to a Student to Study Elocution and to Recite Pieces that Require a Great Deal of Force?

There is a right and a wrong way to study elocution just as there is in singing, and the wrong way is taken much more frequently than the right. But the principles which govern the use of the voice are the same for the two arts. Up to a certain point the training should be identically the same. When expression comes into use the singer goes into music and the elocutionist into literature. If selections which are too strong, which "require a good deal of force," are used by a student who is not yet built up to them the voice will suffer. Such course is bad for the voice and as singing is a delicate art, it shows badly in the singing voice. From this view it would seem wise for the singer to avoid the study of elocution but the practice and not the principle is at fault. On the other hand, if elocution study is rightly conducted the voice becomes well trained and singing is improved thereby.

It seems to be the idea of most elocution teachers that the rotund voice is the only one of value. To secure this they get their pupils to recite in deep tones which demand depression of the larynx. That is bad for the singing voice and, though elocutionists will not admit it, it is bad for reciting. It makes recitation artificial and any art which is made unnatural loses the very essence of its life. But we must take things as they are, and if elocutionists will insist on using that coarse, hollow, ranting voice, which is common, singers should avoid them and their ways. Such ways are certainly injurious to the voice.

We often ask the profession in which we work to show their results; we now ask elocutionists to do likewise. Where are their beautiful speakers and readers? How often do we hear good use of voice on the stage? The answer is that seldom do we hear good vocal utterance and the fault lies with the teaching. It is not based on true principles. The best actors, and there few in proportion to the crowd, are those who have been away from teachers so long that they have forgotten their elocution lessons. It was only when they forgot their instruction of early days that they became good actor.

How Can We Extend the Compass of the Voice?

Most writers say that it should be done by practicing mnch upon the high or low notes, whichever one desires to increase. This has never seemed wise to the writer. There should be no attempt at extension of compass until all the organs are in good working order. All practice in early stages of study must be in the middle of the voice and perfect union of registers is obtained. There must be an even scale and we must be able to sing every note in the same quality. Then to improve the lower voice and extend the voice downward there must be more complete release of the vocal bands. When the vocal bands are thus relaxed there is difficulty in securing harmonious action at first. One side will act more loosely than the other. It takes time to bring perfect action. As this comes about twol whole tones lower, can be added to most voices. At the same time the notes, which have always been used, will secure greater fullness. It is well to call to mind that rather larger breath supply and more perfect control of it is needed for the full resonance of the newly-acquired low notes.

In obtaining additionl upper notes a custom very general must be avoided, namely, pushing registers too high. Nearly all sopranos try to extend the medium voice upward. They sing F, G, and even A, in the medium voice and don't know it. Before the development of the upper voice is attempted one should secure ability to sing notes in the head voice. To do this practice on the notes from D upward in the softest possible voice and with the face particulary bright and pleasant. When one can command this soft voice easily, sing downward from high notes into the lower voice always keeping the bright facial expression. When one gets so she can sing with lightness these soft tones she can begin to expand the tones, making them swell a little. This, once established, can be extended upward, and any soprano will add more upper tones, one at a time. The voice will go upward, as far as high C, without very much difficulty. When the head voice becomes established there seems to be no limit to upward development.

Does it Pay to Train the Boy's Voice? If So, How Can it Be Done?

The boy's voice has many of the characteristics of the woman's. It has the pitch of the woman's, the elasticity and much of the power. A boy can become able to use the voice perfectly with very little training. As the education of a boy in a beautiful art trains something which has great worth into his life, and as it is easy to train his voice, the time and trouble given to it is well spent. We may not expect to obtain the artistic result with a boy that can be obtained with an adult. His conception and mental grasp is less mature. We have heard many boy sopranos who sang beautifully but not one of them satisfied in the matter of rendition. In every case much was left incomplete and the sum of possibilities was never obtained. At the same time so much of good is given that the lack may be pardoned. The good from training the boy is not so much what the hearer gets as in the influence on the boy. He obtains musical education. He learns good music, and if music has any permanent influence in the world it raises the boy who associates with it into one with a finer and better nature. Nothing which can improve the rough nature of the growing youth should be withheld from him. We want men who are full of imagination, perception of the beautiful, sympathy and with ability to express themselves. Such power helps them in whatever may be their walk in after life. The school and college do but a small part of their work in imparting book knowledge. They educate youth by making him better able to go out into the world. Music does the same and more completely than does the school. We believe very fully that it pays to educate the boy in music and to do this it is necessary to train the boy's voice.

When the change of voice comes the use formerly made of the vocal training must be dropped, and it is necessary to begin all over again, practically. This is the only argument, if argument it is, against training the boy's voice. But the education in music and the good influence on the character of the youth can never be lost. This is the more valuable part of his training.

How his voice should be trained depends much on his organs. In general, the same kind of training which woman has should be given the boy. There are two important differences: exactions in physical training need not be so severe; and the quality given the tone must be more round and flute-like. The basis of all training, whether it be with woman, girl, boy or man, remains the same. Breathing, freedom of larynx and good action of speech organs must all be obtained. Before tone quality has attention the organs should be made active. Then the flute quality should be sought in the boy's voice. It can be had by arching the pharynx and carrying higher registers downward. If there is any essential difference in the way of training the boy's and the woman's voice it lies in the advisability of practicing from higher notes downward in the case of the boy. The qualities which come from the head and upper medium voices should be coaxed downward, even if the physiological points of change of registers are somewhat lowered. The larynx of the boy is so very elastic that it will not be harmed if the register changes are made low. (This does not mean that the whole larynx is held low.) The result is the fuller tone.

Training the boy's voice may begin by the time he is six or seven years old. Of course, the practice time for so young a lad would short. Ten minutes at a time is long enough. As he grows older, if he keeps his interest, the time can be lengthened. Study may be kept up till he is fourteen or fifteen years old. When the voice shows the first sign of breaking let vocal training stop. Soon all singing must stop and for two years there should be little or no use of vocal music. Then, when the man's voice has come, the training of the baritone, bass or tenor voice should be begun.

OPERATIC ARIAS.

Eri Tu. Ballo in Maschera di Verdi.

W. LOWES-HEATH.

There is perhaps no baritone aria so full of feeling, and so worthy of study from an artistic point of view, as is Eri Tu. For this reason the student who would study it, must first have his voice in such condition that it may meet the demands made on it without detriment to the organ.

Beyond the mere grace of vocalization, this aria teaches how splendidly the voice can be used, when well trained, as a vehicle for the expression of sentiment, but at the same time to sing an aria of this sort while there are weak or uncertain places in the voice is absolutely harmful, and the only result attained will be wear and tear.

The most obvious difficulty of the aria is the necessity of a splendidly controlled power of sustaining. Much of it is sung piano, but the quality of tone needed is so full of vitality and feeling, that it becomes infinitely more arduous to sustain than if it were forte. The coloring also must be well studied, and in this respect Eri Tu is an education in itself.

No baritone aria gives such an opportunity for a display of art as does this one, but many students and singers mistake the reading of it entirely, play havoc with the sentiment and make a vocal display of it. Even then it is still very effective but only as a mere vocal number, while its greatest beauty and the particular lessons it may have for the student are entirely lost.

Renato believes his wife faithless; she whose love was the happiness of his life. He believes she has yielded herself up to the love of another, and that other is the very friend to save whom he had endangered his life.

He seeks his friend to warn him that assassins are even now on his track; he finds him in the company of a woman deeply veiled. Only after much resistance does his friend accept the warning and flee, first exacting an oath from Renato that he will conduct the lady to a place of safety, and will make no attempt to see her face.

The assassins arrive on the scene, and in their anger at being cheated of whom they sought, they rudely snatch the veil from the lady's face, and Renato discovers his wife. He concludes at once that she was keeping a love tryst and betraying his honor with the friend whose life he had come to save, and believes himself thus wounded in the two holiest feelings that can occupy the heart of a man—love and friendship. Both feelings for the moment give place to one thought; revenge on the traitorous friend. The recitative is stormy and the voice comes out full of anger and menace.

"It is not on her; not in her weak bosom that I must strike. Far other blood shall be used to purge the offense. Thy blood, traitor! And the dagger that shall draw it from thy disloyal heart, shall be of my tears the avenger."

The first phrase, "Non e su lei," breaks out full voice and quickly; the next two, "Nel suo fragile petto, che colpir degg'io," are pronounced more slowly with great bitterness and marked accent.

The phrase "Altro—ben altro sangue," is well accented, especially on the words "Altro." The first time it is drawn out and is full of hate, the second it is held on the D and the voice comes out forte; the word "sangue" is also accented.

The following phrase, "A terger desse l'offesa," is gloomy and bitter, and the phrase "Il sangue tuo,"

addressed to the picture of his faithless friend, forms a climax of the hate and revenge that fill the heart of Renato. It mounts to F-sharp on the syllable oo, and as it is necessary that the tone should ring forte and be well sustained, it will never do to close it up in the back of the mouth. To make this tone effective and less fatigueing, the student should know the practical value of the nasal passage and the hard palate, which will allow him to drop the tongue at the back and throw the throat open, instead of thickening the tongue which makes the tone heavy to sustain and dull in quality, whereby it has only half the carrying power being deprived of all the ringing vibration.

The next two phrases, "E lo trarrà il pugnale, dallo sleal tuo core," accelerate decidedly; they are full of menace, and crescendo to forte each time as they rise.

The next phrase, "Delle lacrime mie vendicator," is full of bitterness, and again we have an F-sharp which must be well sustained at full voice on two very difficult syllables. Coming down, the word "vendicator," which is sung three times, receives a marked accent with a dark quality of tone; it ritards each time, being sung very deliberately at the last.

This brings us to the aria in which Renato, addressing the portrait of the friend who has betrayed him, accuses him of the ruin and desolation which now fills his heart and poisons the whole world for him, comparing it with the delight and happiness which he once enjoyed and the love of his wife.

"It was thou who didst sully that innocent soul, the delight and the joy of my being; whom I trusted, yet in one fell moment thou hast poisoned the whole world for me.

"Traitor foul! That thus thou rewardest the faith of thy friend, thy best friend who trusted in thee.

"Oh delights lost forever, oh sweet memories of a love that made life divine! When Amelia, so lovely and innocent, all radiant with love reclined on my breast.

"'Tis finished; naught know I but hate now; naught reigns in my heart but hatred and death, in this widowed heart.

"O sweet ecstasy lost forever! O ye fond hopes of love!"

The first phrase, "Eri tu che macchiavi quell 'anima," opens broadly but not forte. It is taken in a well controlled half voice, which is colored with an infinite sorrow of regret, for Renato remembers how dear was once the friend who has done him this terrible wrong. The phrase crescendos from the A to the D, and the final word "anima," is well accented on the triplet of eighths.

Illustration 1.

In the phrase, "La delizia dell 'anima mia," the voice is softened still more and is full of tenderness, the quality of which is saddened in the memory of a delight lost forever. The E is taken mezza-voce and receives a slight hold, the portamento is taken piano, but very deliberately and well marked, and again the word "anima" is accented, the eighth notes being sung very evenly to preserve the value of the two against three in the accompaniment.

In the following phrase, "Che m áffidi," the voice expands somewhat on the two quarter notes while the quality becomes bitter. In the next "E d'un tratto esecrabile," the time accelerates a little, the eighth notes are well accented and the voice crescendos till it reaches forte on the E-flat, the voice being kept

Illustration 2.

In carrying the voice from E to A the D is cut somewhat.

closed. As this phrase works into the next "L'universo avveleni per me!" the voice fills with bitterness and passion, and the time is pulled back somewhat while it remains on the E-flat. The phrase is begun forte with the closed voice, but as the feeling grows the syllable ever on E-flat is taken with a full open tone, being held long enough to allow the voice to expand as much as possible. Coming down, the next six notes are sung with a decided acceleration of time, while the following six ritard decidedly and are well accented in a dark quality of tone, the final E before the drop to the low A receiving a hold and being carried by an impressive portamento to the low tone. See Fig. 2.

The exclamation, "Traditor," is taken at full voice in a full round tone. In the phrase "Che compensi in tal guisa," the voice must be held in reserve in the first part that it may expand on the E and F.

The phrase "Dell amico tuo primo," must be sung very evenly with a heavy and dark quality of tone containing more of regret than bitterness, the word "primo" being accented. In the next phrase repeating the same words, the E is held and crescendoed, the time ritards and the whole phrase is accented. The turn is taken rather lightly and quickly, the B-flat is held at mezza-voce and comes down with a portamento.

This brings us to the second part which is marked by a legato style and well sustained piano tone. The first phrase opens piano, and the voice is full of sorrow as Renato dwells on the memory of his lost happiness. Each tone is sung lingeringly and the word "memorie" is accented.

Illustration 3.

The phrase "D'un amplesso che l'essere india," is still kept piano and the tone is full of longing. The turn is taken slowly, each note being accented and the F is held with a sustained piano tone and brought down with a portamento.

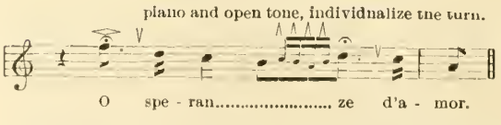
The phrase "Quando Amelia si bella, si candida," is still piano, but the voice expands a little on the C and E, and the turn is taken slowly and individualized as before. In the next phrase "Sul mio seno brillava d'amor," the voice crescendos to the F, which is held and must not be allowed to diminish. The phrase is finished piano, the grace notes are sung lightly and the A is held with a white tone full of vibration.

The next phrase "Quando Amelia," is attacked forte and the time accelerates. In the following phrase "Sul mio seno bril ava d'amor," the time is still accelerated, but it is sung with great breadth of tone and well marked. The voice rises forte to the G, which must be held with a full sustained tone. In coming down the time accelerates decidedly but draws back somewhat towards the close, and again the A is held, but this time with a full-bodied tone.

The phrase "E finita," is sung with impatience and bitterness; the following "Non siede che l'odio," is full of passion and hate. The next, "Non siede che l'odio e la morte nel vedovo cor," comes out forte, the G-flat being held after which the time accelerates decidedly, the words being well marked down to the C. The remainder of the phrase "nel vedovo cor," ritards and is taken with a covered piano, the C being held.

The phrases "O dolcezze perdute," are taken very slowly, legato and piano, with infinite tenderness and regret in the quality. The next phrase "O speranze d'amor," is difficult to sustain. The F is attacked piano and crescendoed to full, breath is then taken and the rest is sung with an open piano tone, breath being again taken after the hold on D.

Illustration 4.



The final phrase "d'amor, d'amor," is taken piano and very de iberately. The final high F, which is held over a full measure, is attacked piano and crescendoed till it finishes at full voice.

To study "Eri Tu," with the ideas I have here given will make it difficult, perhaps, but certainly a valuable lesson to the student.

IDEAS.

FRANK H. TUBBS.

Greater Things.

There is always a tendency to work over and over again the beginnings of musical things. Many never leave them. They are often led by teachers who know only a little and can lead pupils upon the things which they know. To such teachers and to pupils the suggestion of greater possibilities can be brought home. To everyone the idea can be given, "There is more in me yet."

At several times in life to everyone comes the feeling, "I have done about as much as in me lies. I am quite up to the average man, and probably I ought not to expect to be more than that." It is a dangerous moment, for it makes one contented to stop trying to be more. If one leaves himself in that place it is necessary, if he works at all, to go over the same things which he has always followed. A great man will find this mood, which to him is often caused by overwork, succeeded by some such thought as this: "Lately it has been coming to me that I can do and be more than in the past. There are greater things in me yet." On the stimulus which this gives him he works upward. His place from that day is higher and he becomes a better man—a better teacher. Yesterday is cast off. It is a dead yesterday. To-morrow is not yet here. It is unborn. To-day *is* here and it is alive. Filled with the glory of being existent. Anyone—everyone—can, if he but turn his eye within himself, say: "This day I find something within myself which I never knew was there." He may then analyze what he finds and it will give him something upon which to build for greater things. No one can point out for another what things to see. Each can find it within himself.

In vocal improvement there is always much to do, for no voice ever heard has been cultivated up to its possibilities. In the matter of music, no one knows all there is to know. If one did, that knowledge would give birth to something which no one yet knows. In the matter of interpretation—so little understood that we seldom hear any true expression—there is more to do than any man can carry out in a lifetime. There is no time when one may close his work, thinking there is no step to greater things. Neither is there any man who has made all of his life which he might make.

Loyalty.

A beautiful sight it is, to see one's face glow with loyalty to his teacher and to hear words of devotion. Filled with the spirit of loyalty we all build our certainty of usefulness. But, for all its beauty, there is another side to the question. Too great loyalty sometimes ties one down so that he does not become independent. The students must one day take the places of the teachers and make their own loyal set. If we exact too much devotion we can hinder the growth of our students. A second thought is that sometimes loyal feelings may blind us to very faulty work. A tenor, heard frequently in one of the Western States, is always suffering from hoarseness, constantly visiting the doctor and frequently sings badly, even having the misfortune to "break" while singing a medium voice tone. He will not believe the whole trouble comes from having been badly taught. His whole conception of the use of the voice is mistaken and wrong. Yet, he praises his teacher, laying his troubles all to himself, with a loyalty which is touching. So strong is his faith in his teacher that friends do not dare tell him that his vocal method is very bad. What can one do about it? The duty of the teacher is not to refuse the devotion of his students, but to lead them into intellectual perception of their own vocal material, that they can be self-taught. They will be grateful enough to the teacher who does this for them and they will not be blind to their own imperfections.

Mind Weary.

Look into the faces of our teachers and what care we see manifested there! The weight of responsibility is very heavy. The whole future of precious lives is upon them. Our sopranos and tenors hope to become noted, and we are their teachers. It makes us weary—tired, mentally. Every earnest teacher knows the feeling. Let me say two things about the matter: Your feeling holds the pupils in chains; you are wearing yourself out for nothing.

Nothing shortens life like worry. The teacher who takes such responsibility kills himself. Every person

belongs to the great upward-growing human family, over which ever is the great Father. That power, no matter what our conception of Divinity may be, everyone knows that he possesses, and it is that Power which has all the responsibility. Drop yours. Rest from your labors. Let your burden fall. Where will it go? Where it belongs—into the hands of the Father. When you let your burden go into that Power you have strength given you for what does concern you. You cannot fear to let your students be led by that power. Not an act can be wrong, and "whatever is is all right." Have faith. Weary mind is enslaving. Come out into freedom. A weary mind badly effects even the voice, the appreciation of beauties in music and the ability to work. Freedom reverses the brakes and lets us rush into good voice, music and expression. These are just the things which pupils need. These, if you are mind-free, you can give them. They are more useful—a hundred times over—than are your cares and anxieties over your students. *You* need to change if you are mind weary.

"THE CAUSES OF VOCAL FAILURE."

JOSEPHINE CARTER.

Deeper thinkers than I have failed to find the secret of success; profound analysts have searched in vain for reasons for failure in every field of activity.

Success and failure being relative terms, it becomes necessary, as a preliminary, to determine their exact application to this special subject.

Vocal success, I understand to mean, the power to fittingly render any composition with such feeling as to beautify it, whether it be of the lowest order or highest merit. How much the singer falls below this standard determines the degree of failure.

To secure this power one must, above all, have the musical temperament, that gift of the gods which opens wide the portals of the soul, allowing it to escape "on wings of song," to the heights which border "the Seen," from whence it returns to thrill the world with echoes of the music beyond the pearly gates of "The Unseen."

That certain "*Je ne sais quoi*," without which music is dead, method naught, voice powerless, and with which, whether the voice be great or small, the method faulty or correct, the singer never fails to touch the heart, please an audience and disarm critics.

The lack of this inspiration accounts, in part, for the comparatively few singers of world-wide prominence. Every human being is endowed with a means of expressing his divine nature, song being one of the most pleasing mediums of expression. Ruskin says, "All right human song is the finished expression, by art, of the joy or grief of noble persons for right causes."

Like all natural gifts, the musical temperament lies dormant until the opportunity arrives which lifts the fortunate possessor to equal rank with those, who thro' the arts, have found that form of thought which has become their thought of divinity.

Many singers fail because their ambition is simply to excel. These place an over-estimate on themselves regarding themselves, because they possess culture and some talent, as more endowed, more highly gifted than others, arrogating to themselves the right to disregard ordinary barriers, and to step beyond the circumscribed limits which nature sets them. Singers of this class, satisfied with having acquired sufficient skill to gratify their vanity, fall a ready prey to charlatans and unprincipled managers. A singer of note once said she attained no success until her vanity had received a blow from a friend, who quoted for her benefit from Lessing, "The world is full of the middlingly good like us."

The great singers when questioned as to the causes of vocal failure, invariably attribute them to the lack of honest persistent work and study. This want of sincerity results in inadequate technic, affectation and self-consciousness. From honesty of purpose and industry will come the courage to dare, the gallant spirit to surmount all the obstacles with which fate seems to obstruct the road to Parnassus. From sincerity will grow the patience needed to crystalize Science into Art, the enthusiasm which will lighten labor, and the understanding to recognize his opportunity when it arrives.

Faulty methods account for a large proportion of failures. The insincerity or ignorance of the teacher who fails to be governed by an accurate knowledge of the student's physical and mental limitations makes failure a foregone conclusion, for upon this knowledge rests the whole structure of vocal culture and singing. A disregard of these fundamental principles results in faulty tones and unsatisfactory delivery. To quote again from Ruskin, "Every good piece of Art involves first essentially the evidence of human skill and the formation of an actually beautiful thing." This being true, the right method bestows the skill which converts the singer into the artist, and the freedom which enables him to throw himself with abandon into the interpretation of the composition before him.

When the singer has, by industry, acquired the natural method resulting from mentally directed energies, then, and then only, can he dare to take the advice of Gounod, "Be yourself, you will be lonely to-day, but to-morrow you will have a following." Then and then only can he sink his own personality into that of another, or express to the full extent of his power the emotions aroused by words and music. Thus will develope the strong individuality which realizes the hearer's ideal, associating hearer and singer in the "lasting fragrance of a beautiful memory."

Aud then with their singers in lily-white stoles,
And themselves clad in rose color, in came the souls
Of all the composesrs accounted divinest,
And with their own hands did they play me their finest.
—*Leigh Hunt.*

AMERICAN SINGERS RUINED ABROAD.

[The following is reprinted from the New York *Herald*, because it is worth the attention of ambitious singers. It is written by a member of the Royal Berlin Opera Company, and has some measure of authority. Read it carefully.—ED.]

Standing, as I am at present at a point in my career, which, while much higher elevation is possible, is yet high enough to give me a clear view of the wretched mistakes made by singers in their scrambles for fame, I desire to give to students the result of my observations as an American singer abroad, who was obliged to make an American reputation rest upon European success. In every opera house are to be found unhappy specimens of singers who started their careers before they were fitted to leave the studio. Worn out voices, careless execution, lost artistic ideals and throat trouble are the results of unripe beginnings. Thus I cannot warn my fellow students too strongly against the mental unrest of impatient ambition.

The next great mistake, so noticeable here among American students, is the evident craze for an operatic engagement, to be gained at all costs, and the shame of returning to their own land without having accomplished something "professional." This latter result is so feared that students who have voices and talents which can never make them anything above a mere stage drudge, sign contracts for engagements in small, unheard of towns, with the certainty of wretched living and poor pay, and all for the pleasure of seeing the announcement of the engagements in the home papers. The contracts are rarely for less than five years, with two months' vacation in summer, and the salaries are laughable, something to astonish Americans. Furthermore, outside of royal opera houses, each artist must buy her own costumes, and this on her salary is absolutely impossible.

After the notices of the singer's engagement have lost their exhilarating effect upon the artist and her friends she realizes that she must sing three rôles before her contract is made complete, and that then the director may dismiss her if he wishes so to do. Even if retained she is bound in a position which yields no fame and little true artistic experience, and wears out the voice. The whole miserable experience would have yielded but a stray notice in the American papers. That is all. The fear of ridicule is all that really prevents hundreds of students here now from fleeing to their American homes. Better any position at home in a store than an engagement at a small opera house in Europe.

The Ignorance of Critics.

The next mistake is made by the artists before their débuts, or on their visits to an opera house as "guests." They positively fear and speak in hushed voices of the critics, those poor fellows who have to write for the bread that keeps them alive, and who, in many cases, are no more capable of writing upon the merits of a singer than they are able to decide whether the moon has an atmosphere or not. Or, to be less dignified but more expressive, "they don't know a bar of music from a bar of soap," as I heard an American say. Singers fall down and worship these gentlemen, who listen for fifteen minutes to a three hour performance and then instruct the public as to the opinion it should hold regarding that performance. How often does it happen that a critic borrows his opinion from another eye-witness and then dares to pose as the power which singers believe obstructs the artistic path to fame.

The mistake lies in not placing the ability and power of the critic at its true value. Once they are forced to criticise properly they expose their ignorance, which is beautifully covered by phrases about intonation, quality, expression and action. The water only begins to be deep when the article attempts to discuss vocal causes and effects. From these subjects our critics steer their boats very carefully. The plain fact is that of all subjects the male critic is weakest on vocal art when it is expressed by a woman, and singers should realize that this cannon ball rushing toward them in their struggles for fame is nothing worse than a soap bubble, which will break harmless against the material of true merit.

Voice-Destroying Wagner.

The next serious mistake is made when the singer is already launched on her career, and this is not entirely the artist's fault. I refer to the style of music to be sung. It is a fact which any one who has studied the situation as I am doing can verify, that throughout Germany the voices are in a wretched condition, owing to the vocal demands of the Wagner music. The Wagner singers here at the Royal Opera are good examples of the evil influence of this master of evil suggestion in music, Richard Wagner. The singers merely scream. Now this is not art, as I understand the term. Yet singers with a certain type of voice are limited in their vocal choice to Wagner music or bad imitations of the master, because of the lack of compositions which combine the grace of the Italian school with the deeper character of the modern.

If a voice possesses great range and lightness, with power hardly equal to Wagner demands, and yet more than necessary for effective coloratura work, the singer is compelled to confine herself to the Italian works, which are far too trivial for the tastes of this age.

The mezzo soprano is also in a dilemma. The classical compositions are either too heavy for the health of her voice or too light in character to give full scope to her abilities. I have experienced this difficulty myself during several years, conscientiously learning hundreds of new songs, only to throw them aside as unworthy the effort. The lighter works are devoid of grace and depth, and the heavier ones are generally without melody or refinement.

Naturally, the fault lies in the temperament of the composer. We do not find elegance, delicacy or grace in the average German mind, and the solid, restful and slow traits of the German are generally lacking in the Italian. That the American possesses something of both should keep him to the ideal temperament, only, unfortunately, he has too little of either.

The New Style Coming.

Hundreds of new compositions come under my notice every year, and I know that the time has come for a new style of composition which shall cleverly combine the modern with the old Italian school. Then coloratura singing will be something more than a mere exhibition of vocal pyrotechnics. There will be a depth in the composition that will demand a corresponding expression of depth in the voice. Demand creates a supply. With the compositions will come the voices.

I have here in mind the splendid performance of "Norma" at the Theatre des Westens last week by Lilli Lehmann. Here is a voice no longer young, yet possessing at a time when most voices are lost, a noble beauty and dramatic character of tone, with a beautiful and perfect coloratura ability. So fine, so delicate, yet grand, was her rendition throughout the entire performance that I was astonished, and can only say that Lehmann is an exception to the rule. Her performance cannot certainly be equalled by any of the Royal Opera artists, and I know that I should not dare to attempt such a rôle as "Norma" for many years.

Now a last word to students who look with longing eyes toward a foreign stage career. Be sure that the voice is very unusual and perfectly trained. Discipline the mind by severe study of some kind. I studied law and it has proved the best thing I could have done for my career. Test well your power to suffer all kinds of humilation and endure all hardships. Have a well filled purse and a bank account upon which to draw constantly. Be prepared to work like a horse and be treated like a stray dog. Kill all fine feeling and high ideals, harden your heart against all affections, and then come over here and go on the stage.—*Alma Webster Powell, L. L. B.*

BERLIN, May 9, 1901.

THE ORGAN.

Organ and Choir.

ORGAN TUNING.

WM. HORATIO CLARKE.

Every organist should have a practical knowledge of tuning the various stops, because an expert professional tuner away from large cities cannot be obtained at short notice, and pianoforte tuners are not familiar with organ tuning. As a general rule, the flue pipes of the Organ, String and Flute tone seldom require tuning, but often an insect will lodge in some of the upper pipes and not only obstruct the speech, but cause them to be sharper in pitch. The accumulation of dust on the language will also cause the upper pipes to become sharper, and flatter when the flue is obstructed, and after twenty-five years it is customary to clean the metal flue pipes to free them from the dust of years. Where a daily service is held, this accumulation will occur in a less number of years. Occasionally a spider will weave its web inside of a pipe on which the dust will collect and injure the speech until it is removed. In a well constructed organ where the pipes are made of the best materials, and they have not been injured by unprincipled and inexperienced tuners, who "butcher" pipes by cutting into them and bending in the tops with their fingers, no amount of legitimate usage in playing can ever injure or wear out a pipe. If they have never been abused in handling, they will be as good at the end of two centuries as when first made.

The 4 ft. Octave or Principal is neatly cut to its pitch and these pipes throughout are tuned by "coning." The upper pipes of the other metal flue pipes, excepting the String Tone pipes in which with the 8 ft. stops the slot is carried through the five octaves, are also generally coned.

Every organist should possess a set of brass tuning cones. There are generally six in a set, two of them are simply hollow cones without handles for the larger pipes, and the other four of graded sizes, consisting of a handle connecting a solid cone at one end with a hollow cone at the other end. The solid end is inserted with a gentle tap in the open end of a pipe to sharpen the pitch a few waves, and the hollow end is tapped over the pipe to flatten it. The insertion of the pointed end opens the rim slightly, which shortens the length, and the hollow cone rounds in the rim, so shading the end of the pipe that the same effect is produced as if the pipe were made longer to flatten the pitch.

Metal pipes which are tuned by coning are first cut to the exact pitch, so that the ends of the pipes present a neat and regular appearance. The pipes which are tuned by rolled slots, or sliding tuners, are never coned, but present a uniform appearance of a regular smooth rim at the top. To sharpen a pipe with a tuning roll, the roll is slightly tapped downward with a metal rod, or tuning-knife, and to flat it, it is gently tapped upward just enough to bring the pipe in tune. This roll is not adjusted by the fingers, as the heat radiating from the hand would warm the pipe, which when cool would be out of tune. If the tuning roll should accidentally be rolled down too far and then rolled back, the speech of the pipe would be injured, because the interstices on each side of the roll would cause the vibrations of the column of air inside of the pipe to become irregular.

The wood pipes with stoppers or tampions are sharped by gently tapping the tampion downward, care being taken not to get them too sharp, because the tampions fit so tightly that to draw them upward to flat them, the pipes generally have to be taken out of the rack board to draw the tampion.

Before tuning a pipe one must always know whether it is to be made sharp or flat. With an open metal pipe the cone is brought near the rim of the top of the pipe to shade it. If this shading brings it in tune the pipe should made flat. If the pipe becomes more out of tune it is to be made sharp. With open wood flue pipes the tuning is done by opening or closing metal shades, or with horizontal metal rolls across the top.

To find if a stopped pipe needs to be made flat or sharp, the mouth is shaded by any tool long enough to reach it. If on shading the mouth the pipe becomes in tune it is to be flattened, but if the pipe sounds more out of tune by the shading, it is then to be sharpened.

To ascertain which way a reed pipe is to be tuned, it is shaded at the top as with an open flue pipe.

No attempt should be made to tune a pipe until it is known whether to sharp or flatten it. There should never be any experimenting in an organ with the tuning of the pipes.

In tuning an organ the calculations are all made by vibrations and not by the musical sense of intervals. A pipe which is out of tune manifests its discord by a series of vibrations, sounding like "wow-wow-wow-wow," in regular waves. When the pipe is brought in tune these conflicting waves cease.

When a good temperament is set in the 4 ft. Octave, it is only occasionally that a flue pipe will get out of tune so as to be a disturbing element, but the reed stops will require much attention with the changes of temperature to keep them in tune with the flue pipes.

The temperament being set in the 4 ft. Octave, the other stops are tuned to this, beginning with those in the front of the chest, the Open Diapasons. As softer stops "draw" into tune by sympathetic vibrations, a separate temperament is set in them, when the organ does not possess a Twelfth or Octave Quint. Even pipes tuned to an octave higher pipes, "draw" in tune for the time being, and then when played alone sound all out of tune.

If every pipe in the organ should be tuned with the Octave, the organ when played full, would sound greatly out of tune on account of this sympathetic "drawing" or attraction when individual pipes are tuned.

The tendency of pipes simply an octave apart is to "draw" in tune. Unison pipes have a still greater inclination in this respect. An 8 ft. St. Diapason tuned to an Open Diapason would so draw to it that it would not be in tune with itself when used alone. This would be worse with the Dulciana and soft String Tone stops. Fifths do no "draw" as do octaves and unisons. For this reason: after the 4 ft. Octave is tuned, the Twelfth is generally tuned with its perfect fifths or octave fifths. The softer stops in the middle compass of the keyboard are then tuned to the Twelfth by perfect fifths, so that there is no conflicting wave nor "drawing." A pipe tuned to another, two octaves apart in pitch, does not "draw" in tune, so having tuned the Dulciana, from tenor C upward two octaves to the Twelfth, the latter is shut off and the remaining pipes are tuned to those of the Dulciana, which are already in tune, keeping the keys on the manual two octaves apart. The Fifteenth, or Super Octave, is tuned with both the Octave and Twelfth drawn.

The first rough tuning with all the stops is to the 4 ft. Octave, and then every stop is carefully tuned and tested as with the Dulciana and Twelfth. Then the various stops are tested with each other, and if there is any discrepancy its cause is traced out. The Mixtures are tuned in their separate ranks.

In the first tuning of an organ the reed pipes are not put in until the whole organ is tuned. The two octaves, from tenor C upward, are tuned to the 4 ft. Octave, and then the reed stop is tuned to itself, holding the keys two octaves apart, and then tested first with the 4 ft. Octave and then with the 8 ft. Open Diapason.

Equal Temperament.

The organ is tuned to equal temperament, by which is meant that each of the musical keys represented by the twelve chromatic keys have the same relationships in regard to the divisions of the fourths and fifths of each letter as a tonic.

If a stop should be accurately tuned with perfect fifths and fourths in one octave, starting with middle C, so that each letter would have its perfect fifth, proceeding in the following order (Fig. 1):

Fig. 1.

the result at the end of each succession of six notes, the first series ending with F♯ and the second series with G♭, on arriving at the attempt to tune G♭ to D♭, it would be an impossibility, because in pursuing these perfect fifths and fourths, F♯ and G♭ would be almost a quarter of a tone apart. This could be clearly illustrated by having two sets of pipes, voiced just alike and placed on an "organ-voicer" (a small instrument for testing and tuning each set of pipes).

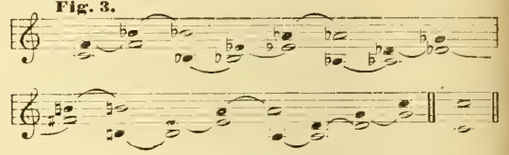
If one set of pipes should be tuned by perfect fifths in the following order (Fig. 2):

Fig. 2.

it will be found, on testing middle C, with its octave above (which, in the illustration, has been tuned as B♯ in the cycle of perfect fifths), that B♯ is more than a quarter of a tone sharper than what the octave above middle C should be.

If the other set of pipes should start with middle C tuned with the first set, and each fourth tuned perfect in the following order (Fig. 3):

Fig. 3.



On arriving at the last fourth in the cycle, the higher C will be found to be more than a quarter of a tone flatter than the true octave above middle C, so that no other than the chords of C would be in tune with the first set of pipes, and the chord of F with the second set, and even then the third interval of the chord would not be in tune. Consequently, the two sets of pipes would not be in tune with each other.

The first attempt to ameliorate this dissonant condition resulted in what is termed unequal temperament in which the keys of C, G, D, A, F, B♭ and E♭ could be played, but modulations into keys any more remote from C were so repulsive and harsh that in organ music the distant keys were avoided.

The more progressive German organists advocated the introduction of a system of equal temperament so that all keys could be played in, and in the course of time it became adopted in Germany as a standard. This method was advocated by John Sebastian Bach as early as 1722 and practically applied in his "Well-Tempered Clavichord," containing the Forty-Eight Preludes and Fugues. The system met with much opposition from organ builders, of whom Silbermann was one of the most celebrated. It is traditionally related that when Bach recognized him among his hearers when playing one of his instruments, he would introduce an improvised fantasia in the keys of A♭ or E; and more remote keys from C, in which the effect of the modulations were very repugnant with the unequal temperament, which dissonance would drive the excited builder from the room. On his expostulating with Bach for playing in those keys, which was done to illustrate the unmusical effect of the unequal temperament, the organist would humorously reply, "You *tune* the organ in the manner *you* please, and I *play* the organ in the keys *I* please!"

It is only within the last half century that equal temperament was accepted in England. The large organ in St. George's Hall in Liverpool, built in 1855, was tuned to the unequal temperament, but the effect in playing in remote keys was so dissonant that in 1867 it was retuned with the equal temperament.

The equal temperament met with much opposition from the theorists who insisted that it interfered with the law of enharmonic relationship which conflicted with the theory that D♯ and E♭ are two distinct tones, as well as all the other chromatic intervals in which every white key has three names, C, B♯ and D♭♭, which should convey to the mind the idea of three distinct tone-relationships.

Theorists have been so sensitive over this point, that at various times during the past century, organs have been built with several sets of pipes for one stop, with three or four keyboards to play this one stop.

In 1849. the late Henry Ward Poole invented and built an Enharmonic Organ with one manual, with several sets of pipes for each stop, having a complex pedal mechanism by which in modulating to any key, the pressing of the requisite pedal would bring on a set of pipes which would give perfect fourths and fifths. This instrument was used in Church service for a number of years and attracted much attention from a scientific point of view, but it was more of a curiosity than of practical value, because its modulations could only be from one key to its fifth or fourth above.

Mr. Poole was an enthusiast on this subject, and once brought me the drawings of an instrument of which he desired me to supervise the construction. The keyboard had 53 keys in the octave instead of the usual 12 chromatic notes. Its complication defeated the possibility of either its construction or manipulation.

The effect of equally tempered fifths and fourths is not unpleasant and the resulting sound waves are not perceived in the various harmonic modulations. In order to test this assertion I have often called the attention of organists and musicians, who have no knowledge of temperament, to the subject, and they had not noticed these tempered sound waves until I had illustrated an analysis of the theory of adjustment. Imperfect as it seems, theoretically, equal temperament has been universally adopted as a necessity in the present age of musical development. No voices sing together or instruments play together with as few dissonant sound waves as are produced with equal temperament.

In order to temper the fifths and fourths of each of the twelve keys so that each key will be the same in regard to all the intervals, each fifth above any given note must be a certain number of waves *short* (—) of a perfect fifth, and each fourth above any given note must be a certain number of waves *longer* (+) than a perfect fourth.

The method of setting the temperament in a new organ is thus illustrated: It is set in the 4 ft. Octave Stop, first in the voicing room before being placed in the organ. Each pipe is smoothly cut as near the temperament as possible before coning.

In Fig. 4 the open note represents a pipe which is tuned and the black note the pipe which is being brought into tune.

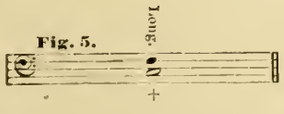
Having tuned the pipe, which is of 2 feet in length in the 4 ft. Octave, which sounds on tenor C of the manual, the *bearings* are first set with the fifth, fourth and octave above

Fig. 4.

the G is tuned to a perfect fifth with C and then is slightly made *flat* (—), so as to produce a sound wave of about 90 beats per minute, more or less, according to the pitch.

Tenor F is next brought to a perfect fourth (Fig. 5)

Fig. 5.



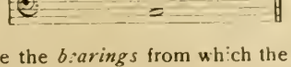
and then is sharped (+) just enough to produce the same number of beats per minute, as with the short fifth on G.

The fifth above F is then tuned perfect and flatted, so as to produce a similar sound wave, and then is adjusted in tuning so that there will be an equal series of sound waves when tested with G (Fig. 6).

Fig. 6.

If these beats have been correctly equalized, when this upper C is tested with octave below, will be in perfect tune with it (Fig. 7).

Fig. 7.



These are the *bearings* from which the adjustment of the temperament is to be made. The temperament is not tuned by octaves, but by fifths and fourths, the octaves only being used as a test of the correct adjustment of the temperament.

The adjustment will then proceed in the following order, first with the G side. After G has been tuned to C the D below G is next tuned to a perfect fourth and then slightly flatted so as to make a long (+) interval, with the requisite number of waves, comparing the waves vibrating with C and G. Thus proceed until B and the F♯ below are adjusted in their + relationship.

Then tune the F side, as indicated in Fig. 8, until D♭ and the G♭ are tuned. If the vibrations have been evenly divided, F♯ and G♭ will coincide in perfect tune, with no "wolf" resulting from an unequal distribution of the vibrations. To be more explicit, if the waves have been equally divided on the G side, ending with $\left|\begin{matrix}B\\F\sharp\end{matrix}\right.$ and the waves on the F side have also been evenly divided, ending with $\left|\begin{matrix}G\flat\\D\flat\end{matrix}\right.$ on tuning this last interval as a + fourth, the previous tuning of the F♯ will require no charge, as it will constitute the + fourth of D♭ or C♯, enharmonic differences not being recognized in equal temperament.

If a mistake has been made in tuning short fifths and long fourths it must be found, and if the sound beats have been too slow or rapid, experience only will make one familiar with this art:

Fig. 8. G side.

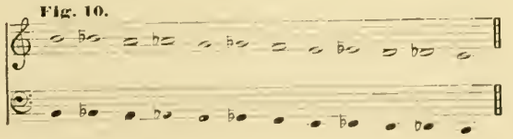
If 1 ♯ coincides with G♭, the temperament will proceed with the next octave above, testing C with the fourth and fifth below to see that there has been no change, as in Fig. 9:

Fig. 9.

And thus proceed for an octave higher.

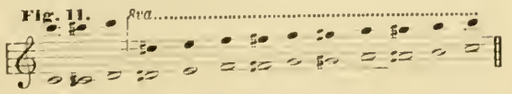
The lower octave is tuned as illustrated in Fig. 10, and the fifths and fourths tested:

Fig. 10.



The upper octave is thus tuned, as in Fig. 11:

Fig. 11.



This will complete the temperament in the 4 ft. Octave. The stop should then be tested with notes two and three octaves apart. In this method of setting the temperament, the thirds of each chord become properly tempered without any adjustment.

Although it requires much experience to set the temperament in an organ stop, the theory should be understood by every organist, and he can study these temperament vibrations in the instrument over which he presides. If he has occasion to tune any pipe within the temperament range, he can tune it to another pipe two octaves from that note.

SERVICE PRELUDE, No. 2.

In this pastoral movement in G, the sextuple theme is given in the first section of eight measures, followed by the second section which ends with the dominant chord. Next follows an episodial transition of two measures in E flat, imitated in the two following measures in B natural, leading to the theme which is taken up in E minor, concluding with a Coda ending in G major.

In playing this piece with the registration as indicated, the harmony is complete in the four manual parts. The 16 ft. Pedal Bourdon, uncoupled to the manuals, simply enters as an undertone. A sustained undertone in the pedal part is characteristic of the rustic theme of an organ pastoral.

As a Study, this melody may be played throughout on the II Oboe or Oboe Gamba with the right hand, accompanied with the left hand playing the alto and tenor on the I Dulciana, and the I manual coupled to the pedals, both feet playing the manual bass part.

Next, play the melody an octave lower on the I manual with the 4 ft. Flute with the left hand, the right hand playing the alto and tenor on the II manual with the Salicional, this manual being coupled to the pedals for both feet to play the manual bass part.

For a pedal study, couple I to Ped. and draw the 4 ft. Octave or 2 ft. Super Octave, and play the melody with both feet, beginning on the lowest G of the pedals. Play the alto and tenor with the right hand, and the manual bass part with the left hand, on the II manual with the Salicional and St. Diapason. Play the melody with the pedals so clean and legato that it will sound as smooth as if played by the fingers. Students who persist in this study of pedal playing will make rapid progress.

DEVOTIONAL CHOIR MUSIC.

WM. HORATIO CLARKE.

This subject has specific relation to the order of music connected with religious services. Public devotion is allied to the act of consecration to religious principles embodied in various forms of worship. To worship is to honor with reverence and live according to those divine truths which build up the moral and spiritual character. These divine truths are inculcated in the rites, ceremonies and symbols of public religious services.

Variety of Forms.

Church formalities consist of an acknowledgment of the Infinite in expressions of prayer, praise and the teaching of the doctrines peculiar to each sect, according to its conventional rules. On account of denominational differences these acts of devotion range from the simplicity of a lecture room essay, through various rituals, up to the most elaborate sacerdotal ordinances.

In all this variety of observances music forms an essential part, and its use extends from inappropriate reminders of secular and operatic melodies to the ascetic and devout Gregorian chant; from hymns, anthems and oratorio choruses to the ornate Latin mass, the grand Anglican Te Deum and the stately musical service of the Jewish temple.

Since there are more than a hundred different sects there cannot be a standard for all. The numerous orders of modern metaphysical healers, theosophists, etc., have their regular services of worship with their devotional hymns, which exert the same influence upon their followers as the more solemn forms of the historical cathedral service.

Therefore a very broad view must be taken in considering this subject, which will not exclude even the religionists who discard instrumental music as sinful, and who only permit certain metrical forms of psalms and hymns to be sung.

As each sect has its own style of vocal music the subject can only be alluded to on general principles. Yet there should be a specific reverential style in all devotional music, excluding reminiscences of secular associations. It should possess a form which is at once suggestive of consecration to a holy purpose and leading to religious contemplation.

The Body and Spirit of Music.

Devotional music has an external and internal form—a body containing a living spirit. The external form appeals to the esthetic sense and should be adapted to the degree of culture of both the singer and hearer. Within this external form there is a

deeper meaning than appears in the vestment of the sensuous sound.

The spirit of music symbolizes a life in harmony with divine laws. Divine laws are incarnated in the life by obedience to those Two Great Commandments which contain the fundamental principles concerning our relation to the Infinite Life and humanity. These are the foundation stones of all temples of worship, the pediment on which rests the fountain whence all the virtues emanate and to which the highest art points and leads.

Religious Meditation.

Devotional music is allied to sacred words which influence the mind to reflect upon these heavenly virtues which constitute what is called eternal life. This meditation induces a condition of thought which leads to the examination of the motives in all our actions and incites us to discover and reject the love of self, and to incorporate in its place a regard for the welfare of others in all our thoughts, speech and action.

This examination of the motives constitutes religious contemplation, and devotional music clothes these serious thoughts with melody and harmony. Thus it aids in creating a feeling of reverence in impressing a holy state upon the mind.

According to his education and affiliations the form of religious expression of every thoughtful person is holy to him, and the more artistic and consonant are the environments of the place consecrated to public worship, the more he reveres the external associations of the sanctuary.

A Ritualistic Standard.

Let due honor be ascribed to the memory of those who built and to those who sustain the grand cathedrals and temples in their wealth of magnificent architecture which enshrine the symbols of a higher life! Here the noblest music pervades each lofty arch and resounds from wall to wall inspiring thoughts which lead the mind to hope for realities hid within the veil of mystery yet to be solved. Here the ecclesiastical form of devotional music has full sway, which is never desecrated with trivial and sensational associations, and it is well to hold in deep veneration such consecrated places where the dignified music is in harmony with all the emblems of worship.

Uncanonical Music.

But there are minds who feel the Infinite Presence as the Life of all things whose constant thought is: "Wherever I am, God is present, for my life is His life in me." Such minds often have no interest in the sphere of formal services where reverent attitudes, adorned altars, surpliced choristers and grand organs are held in devout esteem. Yet they meet with other minds of kindred spirit and unite their voices in sacred hymns, thus receiving inspiration without the aid of stately ceremonials.

The Purpose of Church Music.

The object of devotional music is by means of the external sound, to aid in awakening and intensifying the internal idea for which music stands, according to the needs and associations, which are the most congenial and helpful to the order of thought which a person holds.

Country Choirs.

As a matter of art the music should always be of the best character and appropriate to the words, and it should be sung in tune. In a religious service no attempt should be made by singers to render music which is beyond their capacity to execute well and in tune, for there are often sensitive listeners, who are irritated by music poorly rendered, which destroys all devotional feeling.

It is commendable to cultivate a high ideal of church music and at choir rehearsals to study the best order of compositions, but when such music is beyond the attainments of a choir they should sing in the devotional services only those melodies and harmonies which best promote a religious sympathy, such graded music of a good quality always being obtainable from the publishers.

Irreverent Personal Display.

If the music in a church service partakes of or is suggestive of a concert and attention is attracted to the singers rather than to the object of devotional music, the purpose is not fulfilled. There shou'd be no attempt at personal display on the part of a singer or organist in a devotional service, and there should be a marked difference between such a service and a concert or festival occasion.

ANSWERS TO QUESTIONS.

Country Choir Leaders.

S. F. A.—"Will you please give in The Musician, a list of anthems of the first and second grades for village or country choirs? I should like to have included those which have been tested by constant use in past years. I cannot judge of them by simply seeing the names in catalogues. I hope that you will give a great deal of information for the country choirs, for it will be appreciated. Many of our choirs in this section have a very limited knowledge of music. Will you also request that other choir leaders send you lists of easy anthems which have been popular with their choirs?"

Answer.—Beginning with the July number of The Musician, a column or more will be devoted to notices of anthems which time has proved to be worthy of commendation, and new choir pieces which are meritorious, and none will be mentioned which will be disappointing. They will all be graded from a personal examination and commended without regard to authorship. Your suggestion that other choir leaders send in the names of their most popular anthems is commended to the attention of choir masters and singers. Communications and queries from leaders, singers and music committees will be welcomed in this department. A good church choir is a strong factor in the education of musical taste in villages and country sections.

An Egoistic Obstacle.

W. A. W.—"I am a member of a chorus choir in whose success I am deeply interested. We have a vocal leader who is so absorbed in singing his own solos, that each Sunday he introduces music in which he can exhibit his proficiency to the best advantage in nearly every anthem which we sing. On account of his ambition to give his voice undue prominence, all the choir music is selected for this purpose, our parts always being made subordinate as a background of support.

"We have borne this a long time without complaint, but it is having a deleterious effect upon the interests of the choir, and we are tired of it. We now earnestly desire to have this exhibition of personality discontinued, as it is putting a damper on our efforts. The singers are dissatisfied, and members of the congregation are passing unfavorable comments to our detriment as a choir.

"Is there any courteous way in which we can approach him without giving offence, with a request that his solos shall either be omitted or lessened in number, and anthems selected and thoroughly drilled upon which will better serve the purpose for which our choir was organized?"

Answer.—You have touched upon an important matter concerning choir leadership pertaining to the removal of a serious obstacle in musical progress. A choir leader should fully understand and be in sympathy with the object of devotional music. As the true minister is one who serves others in spiritual affairs without asserting himself, so the choir leader should desist from attracting attention to himself. His real personality will exert its influence in well directed efforts to perfect the attainments of his choir in guiding them toward the accomplishment of the object for which they are organized. If he is a composer he will be very chary in introducing his own pieces unless written for a special occasion. He will recognize and welcome the contributions of other church musical writers, and delight in introducing anthems which will please and stimulate his choir to higher progress.

The exhibition of personal vanity in public is always obnoxious to others, and the craving for adulation not only meets with no response, but defeats itself. If such manifestations are persisted in by a choir leader, a volunteer choir will be broken up. A paid choir is held together by the pecuniary emolument, but a chorus choir is kept united by their interest in good music, and by the appreciation of their services on the part of the congregation.

The idiosyncrasy of a self-exalted musical nature is such that you cannot approach your leader upon the subject in any way without giving him great offence, which will doubtless lead to his resignation. A singer having the characteristics which you mention, estimates his voice and talents as the chief elements of his personality, as if they constituted his character, and his pride cannot be wounded without his experiencing a feverish mental sickness in which state he views any unsympathetic expressions with repulsion, and attributes such as the outgrowth of envy and lack of musical culture.

If you feel called upon to act as the mouthpiece in giving expression to the opinions of the choir, do so in a courteous, honest and direct manner in a private personal interview. If he repels you with indignation, for which you must be prepared, interview him again, having with you two or three members of the choir, without giving it publicity. If this fails, a kindly-worded petition, signed by the members, will avail. Use your best judgment in the interest of harmony, but do not let your choir become disorganized on account of one man.

Chorus Choir Music.

During the past month more than fifty anthems and services were received for review and grading, and out of this number there was not one which could be recommended for Sunday use in American choirs. Many of them were composed for the full Cathedral Service, with obbligato organ accompaniment, requiring the highest order of instrumental and trained vocal talent, with a knowledge of harmony by the singers.

In the full Cathedral Service the choir of boys and men is equally divided into two sections. The Cantoris division is seated on the north side of the Choir with the Precentor or Cantor, an officer in a Cathedral who in dignity ranks next to the Dean.

The Decani section is located on the opposite side which is called the Dean's side. When the music is indicated as "Full," the Decani and Cantoris voices unite, and when either side is to sing separately or responsively, the music is marked "Dec." or "Can." and when the parts are to be sung by single voices, the passage is marked "Verse."

With the exception of those Episcopal Churches where a trained Cathedral Choir is maintained, this music cannot be effectively rendered.

American Church Choirs are composed of mixed voices in paid quartets, or volunteer chorus choirs.

Some of the anthems reviewed were of the highest order of structure, which could only be rendered by professionally educated singers. Such music could only be understood and enjoyed by cultivated musicians, and its place is in the sacred concert, or some special occasion in which music has a distinctive part. Such an order of composition does not belong to the Church service, where the music should lead to devotional thought.

Some of the anthems graded were transcriptions from secular part songs, such as Pinsuti's "Good-Night, Beloved," arranged to "We Stand in Deep Repentance, Before Thy Throne of Love." It is a beautiful part song as associated with the original words, but incongruous when set to the religious text. There should be a distinct line drawn between devotional and secular music when allied to sacred words. One of these anthems consisted of a medley introducing "Blue Bells of Scotland" and "Home, Sweet Home." The accompaniments to some of them were arranged in broken pianoforte style of chords without continuity or progression.

Others were too pusillanimous for consideration, both in melody, harmony and rhythm. Among these was one entitled, "There Arose a Great Storm," in sextuple measure, while the soprano is singing over and over, "And Jesus asleep on a pillow, And Jesus asleep on a pillow," the other parts are keeping up a tripping accompaniment with the words:

> "On a pillow, pillow, pillow,
> On a pillow, pillow, pillow!"

The performance of this piece in a Church service would make a sensitive listener involuntarily exclaim, "O, give us a rest!"

No music will be noticed in this department which will not be of practical use in American choirs as a standard of Church music according to the grade indicated, and the lowest grade mark will be only for good music, the marking being for the degree of difficulty. No music will be criticised nor defects mentioned, because such a class of anthems would be of no use to any choir; but those which time has proved to be useful in devotional services will be included as well as new compositions.

If the various publishers will send to my address* new anthems which they know are in harmony with this standard, and older pieces for which there has been a steady demand, I will give them a grade marking from 1 to 7, and call the attention of choir leaders and singers to these publications according to gradation and serviceableness, and due credit will be given each publisher.

---

* Reading, Mass.

IN THE MUSICAL WORLD.

AMONG OUR SCHOOLS AND TEACHERS.

Pupils of Miss Rose W. Hicks, of Trenton, N. J., gave an interesting musicale at her residence, on April 20. Miss Hicks is a pupil of Joseffy.

Mr. Cecil Carl Forsyth, organist of the Knox Presbyterian Church, of Perth, Ont., Can., gave a recital on May 7, which was successful and called forth the praises of those who were present.

A comprehensive program, which included some excellent music, marked the inauguration of Mary Emma Woolley, as President of Mount Holyoke College, South Hadley, Mass., on May 15.

A recital at Ad. M. Foerste 's Studio on Wednesday, May 22, 1901, presented compositions by Mr. Foerster: Falrest of the Rural Maids; Serenade; S'eep, Little Darling; Proposal; Fair Rosaliud; Sonnet, Op. 13; Fantasy; Ilc Loves Me; Water Sprite; Cradle Song; The Young Rose; Old Proverb; f Love thee; Lamentation; Exultation; Adoration; f Saw Thee Weep; Love's Philos phy; An Evening in Greece; Suite, Op. 46. Part-Songs: Spring's Verdure; May Song.

The eighth grand concert given by the Normal Choral Club Tuesday evening, May 7, Miss Julia E. Crane, conductor, was a very successful one and ranks among the best yet given by the Normal School forces. The first part of the program was miscellaneous in character and, perhaps, the most pleasing to the general audience, although the "Hymn of Praise" was a much more severe test, musically and techuically, for the chorus, soloists and orchestra. Miss Crane is to be congratulated upon the success of this entertainment.

Pupils of Mr. and Mrs. Ernest Lent, of Washington, D. C., gave a musicale, May 24, at which the following interesti'g program was played: Gounod, Faust-Fantasie for string orchestra and pianos; Raff, Tarantelle for two pianos; Dancla, La Straniera for violin; Alard, Berceuse for violin; Beriot, Sixth Air varié for violin; Loew (a) Peasant's Dance, (b) In the Swing, for piano; Thome, Under the Leaves, for piano; Nevln, Dreamland, for piano; Mendelssohn, Trio for piano, violin and vloloncello; Mozart, Allegro for string-quartet; Godard, Mazurka for piano; Raff, Etude Melodique for piano; Raff, La Fileuse for piano; Daniels, Barcarole for violoncello and piano; Godard, Berceuse for violoncello; Beriot, Scene de Ballet for violin; Wieniawski, Airs russes for violin; Hiller, Luetzow's Wilde Jagd for two pianos.

The twenty-eighth recital of the music department of the Fremont (Neb) Normal School, on April 9, was devoted to the compositions of Mendelssohn. The program was as follows: Vocal Duet, "I Would That My Love," Miss Sophia and Dinah Kvam; Piauo Solo, "From the Christmas Pieces," Op. 72, Nos. 3-4, Miss Florence Brooks; Violin Solo, "Wedding March," Mr. Lucius Lumbard; Vocal Solo, "Italy," Miss Sophia Kvam; Brief sketch of the life and works of Mendelssohn; Piano Solo, "Hunting Song," Op. 19, No. 3, Miss Laura Stoddard; Terzetto, "Lift Thine Eyes" (from "Elijah"), Misses Lamb, Perdee and Mrs. Wilson; Violin Solo, "Spring Soug" Miss Florence Brooks; Piano Solo, "Spinning Song," Op. 69, No. 4, Miss Edith Perdee; Aria, "Hear Ye, Israel" (from Oratorio "Elijah"), Miss Virginia Francis: Piano Solo, "Rondo Capriccioso," Miss Jessie Newcom.

Abram Ray Tyler, organist of the New York Avenue M. E. Church, of Brooklyn, gave his twenty-seveuth recital (during seven years connection with the Church) as a farewell, on April 24. He played the following program: (a) Prelude—C major, (b) Fugue—A minor. John Sebastian Bach; Aria for Bass—O God have mercy (St. Paul), Mendelssohn; (a) Pastorale, Edwin H. Lemare; (b) Andante Cantabile, Charles Marie Widor; (c) Canzona, King Hall; (d) Ecloque (transcribed by the performer), Franz Liszt; Aria for Soprano—With Verdure Clad (Creation), Haydn; Sonata Pascale—(a) "Sonata Pascale" (Allegro), (b) "Adoration" (Andante), (c) Finale "Allelula;" (a) "At Evening" (fdyf), Dudley Buck; (b) Concert Piece, Horatio W. Parker; (c) Romance (No. 1, in E), Harry Rowe Shelley; (d) Fugue, Henry M. Dunham; Duett for Soprano and Bass—Scene from "Elijah," Mendelssohn; Improvisation by the performer. On Sunday, May 28, he concluded his labors with a fine presentation of Dudley Buck's Cantata, "The Triumph of David."

The Twentieth Century plans of the New Eugland Conservatory of Music, Boston, have been matured, after prolonged investigation and efforts made by the trustees. A new conservasory is to be built near the coner of Huntington and Massachutetts avenues, thereby adding to the musie halls of the vicinity of this institution, which will aggrandize the region as the musical and art centre of Boston. The fire-proof conservatory edifice costing $400,000 will be devoted wholly to the detail work of professional teaching and study, or to the work of the eduea-tional department alone. It will occupy over 30,000 square feet of land, will be three stories high and will contain over sixty recitation rooms and two fine auditoriums, one seating 1,000 and the other 400 persons. In the large auditorium one of the finest pipe organs in this country will be built. The style of architecture will be Grecian and the stage will be specially adapted for chorus and orchestral concerts and for the performance of operas. The smaller hall will be devoted to lectures and pupils' recitals. All the furnishings and appointment of the building will be modern and provide for health, convenience and utility, and the exterior and interior will be a monumental and artistle addition to the architecture of the city.

A series of three song recitals were given by pupils of Mrs. Nellie Evans Packard, of Brockton, Mass., May 24, 25 and 27. The programs well selected and arranged and are printed herewith: "When You Are Coming," Roeckel; "Mignon," d'Hardelot; (a) "A White Rose," (b) "There, Little Girl, Don't Cry," Norris; "The Thought of You," Dennee; "Were I Gard'ner," Chaminade; "A Red, Red Rose," Hastings; "The Brigand," Spence; "Summer's Here," Aspinall; "Serenade to Junanita," Jouberti: "My Beloved Queen," Rose; "The Bird and the Rose," Horrocks; "Blow, Blow Thou Summer Wind" (from "Florabel"), Rogers; "Who'll Buy My Lavender?" German; "Vulean's Song" (from "Philemon et Baueis"), Goun d; "When," Bevan; "The Spirit of Spring," Parker: "The Lonely Rose," Hermes; "A Winter's Lullaby," DeKoven; "Little Boy Blue," Nevin; "Sweet Land of Dreams" Waltz, Ashford; "Fiddle and I" (with violin obligato), Goodeve; "The Shoogy-Shoo," Ambrose; "The Gleaner's Slumber Song," Walthem; (a) "The Iciele," Rice; (b) "The Virgin's Lullaby," Gounod; (a) "Four Leaf Clover," Brownell; (b) "Violets," Wright; "Grecting," Hawley; (a) "Serenade," Neidlinger; (b) "Oh Fair, Oh Sweet and Holy," Cantor; "A Gypsy Maiden, f," Parker; (a) "Beam from Yonder Star," Bullard; (b) "When Love is Done," Alling; "The Viking's Song," Adams; "Flower Girl" (canzone from "La Fioraja"), Bevignani; "O Thou Afflicted (from "St. Peter"), Benedict; "I Will Extol Thee" (from "Ell"), Costa; "How Long Will Thou Forget Me, O Lord?" (from "Triumph of David"), Buck; (a) "The Sweetest Flower that Blows," (b) "f Walt for Thee," Hawley; "Magnetic Waltz," Arditi; "Honor and Arms" (from "Samson"), Handel; "Farewell, Ye Hills" (Joan's Aria from "The Maid of Orleans"), Tschaikowsky.

An enjoyable piano recital was given in the St. Cecilia Auditorium of St. Mary's-of-the-Woods, Indiana, conducted by the Sisters of Providence, on May 28th. Miss Maude Helm, a pupil of the institutiou, assisted by Miss Helen Hanna, soprano, rendered the following program with much taste and skill: Fantasia Chromatica, D minor, J. S. Bach; Sonata, Op. 10, No. 3 (Presto, Largo e mesto), Beethoven; Sing On, Luigi Denza; Etude Poesie, No. 3, Haberbier; Nocturne, Op 62, No. 1, Chopin; Alla Stella Confidente, Rabandi; Ich Liebe Dich! (transcription), Grieg; Rondo Capriccioso Op. 14, Mendelssohn; Pretty Zingarella, Millard; Toccata, Op. 30, No. 3, Foote; Etude de Concert, F minor, Liszt; Concert, Op. 25, Mendelssohn.

The thirteenth annual meeting and festival of the New York State Music Teachers' Association occurs at Glen Falls, N. Y., Tuesday, Wednesday and Thursday, June 25, 26 and 27. Under President Louis A. Russell, vigorous efforts are being made to have this meeting the best so far held. Mr. J. de Zielinski, chairman of the program committee, announces the following array of brilliaut artists: Piauo: Alberto Jonas, Alf. Klingenberg, Jessie Shay, Anna E. Wilbur, Marvin Grodzinsky. Violin: Frederick E. Hahn, Rebecca Wilder Holmes. Organ: Wm C Carl, Wilhelm Kaffenberger, Carl G. Schmidt. Trio Club: J. de Zielinski, piano; F. E. Hahu, violin; Mark Skalmer, 'cello. Sopranos: Charlotte I. Bord, Gertrude Harrison, Louise B. Voigt, Marie Zimmerman. Contraltos: Adele Laeis Baldwin, Grace Preston, Antonia Sawyer. Tenors: Robert Burton, J. Henry McKinley. Baritone and Basses: W. E. Chamberlain, Dr. Carl Dufft, Adolf Dahm-Petersen, Lewis Williams. Excelsior Male Quartet, Glen Falls Choral Union, Wm. F. Merihew, conductor; Festival Chorus of 100 voices; Orchestra of twenty-five players, to give the Messiah, L. A. Russell, conductor. Essayists: Miss Amy Fay, Mr. A. J. Goodrich, Mr. H. W. Greene, Mme. K. von Klenner. Mr. Frank H. Shepard, Mr. Albert Gerard Thiers. The prospect for a fine meeting is thus assured, for of reeent years no such array of prominent soloists has been secured. The essayists will all present live issues in attractive form, and the opening banquet Monday evening, June 24, is now being planned. All members are urged to attend this enjoyable function. Special railroad fare, Hudson River boats, excursion to Lake George, are a few of the inducements. Anyone can join this Association ou payment of $2.00. For further information, address F. W. Riesberg, Sec.-Treasury, 954 Eighth Avenue, New York.

AT HOME.

It is said that Earl Gulick, the well-known boy singer, is losing his voice.

The Arkansas Music Teachers' Associatlon meets at Little Rock, June 12 and 13.

Mr. William C. Carl, the organist, will give three recitals at the Pan-American Exposition in October.

Religious Music, a figure-group by Isidore Konti, is one of the fine bits of sculpture at the Pan-American Exposition.

The Pittsburg season of the Grau Opera Company was a distinct financial success. The total receipts for the five operas given there were $38,307 50.

Rev. L. H. Sherwood is dead. He lived in Lyons, N. Y., and founded the Lyons Musical Academy. Among his pupils was his son, William H. Sherwood.

The Missouri State Music Teachers' Association meets at Columbia June 18 to 21. Mr. W. H. Pommer is the President, and Mr. H. E. Rice, Secretary and Treasurer.

The New York State Music Teachers' Association will hold its meetings at Glen Falls, June 25, 26 and 27. The closing concert will be a performance of the "Messiah."

Sousa has been honored by the French Government. He has been appointed "Officer of the Academy," an honor reserved for those who win distinction in the field of arts and letters.

Saint-Saëns has returned from Algeria, bringing with him his new work, "Barbares," written during this trip for the opera at Paris. Those who have seen the score affirm that it is fully equal to the "Samson and Delila."

The great organ in the Temple of Music, at the Buffalo Pan-American Exposition, will be equipped with every device kuown to organ builders. Of the four manuals, the great and small organ will each have fourteen stops, the choir organ eleven, the solo organ four, the pedal organ ten.

The Newark (N. J.) *Sunday Call* printed in a recent issue an excellent article on the old English song, "Sumer is lcumen in," and reproduced the original manuscript. Thus were thousands of readers taught a bit more about art. A worthy manner of using space. May others follow the example!

The Newark Symphony Orchestra, under the direction of Louis Arthur Russell, gave a concert Friday night, May 10, the program being of a popular nature, with some good old music, and much that was good from modern composers. The soloists were Miss Marjorie Fee, contralto and Henry Goldberg, baritone.

Mr. Nathan H. Allen officiated as organist at the organ opening in the First Congregational Church, Bridgeport, Conn. Mrs. Josephine Jennings Percy, soprano, of New York, and Mr. W. R. Clarke, basso, of Bridgeport, assisted. The organ was built by Müller and Abel, of New York. The instrument is a two-manual and pedal organ of the larger type, Gothic in style.

A number of American musicians have taken advantage of the prize fund established by Paderewski a few years ago, when he gave $10,000 for the encouragement of native composers. The judges have received sixty-eight works, among which are thirty-one for orchestra, nine for chorus, twenty-eight pieces of chamber music. There are seven symphonies, four symphonic poems, and eight overtures.

Leonora Jackson, the young American violinist, has filled 160 engagements in a concert tournee during the season just closing, which included the Pacific Coast, Canada and the South. Miss Jackson has postponed her return to Europe this summer, and, supported by Harry J. Fellows, tenor, and William Bauer, pianist, she will remain in America for the seasons 1901-1902, and will make another tour.

Local papers of Potsdam, N. Y., spoke highly of the concert recently given there by the Normal Chorus Choir, directed by Miss Julia E. Crane, and assisted by Miss E. Grace Wood, soprano; Mrs. Harriet Crane Bryant, contralto; Francis Ten Eyck Sisson, tenor; and Mrs. Agnes Brady, Miss Alice Houghton and Miss Lucy LaDuke, accompanists, with Martin Anstead in charge of the orchestra. The first part of the program was miscellaneous, while the latter part contained Mendelssohn's "Hymn of Praise."

Mr. B. J. Lang, of Boston, has declined to continue as conductor of the Apollo Club. The Club has issued the following statement: To Mr. Lang, who has been its conductor ever since the formation of the Club, in 1871, and who now, to its infinite regret, positively declines a renomination, the Club wishes to make earnest acknowledgement of his devoted services and his eminent musicianship. To him not only the Club but our whole community owes an everlasting debt of gratitude. May he live long to enjoy the fruits of his labors, and to see an advance in the cause of music in the coming generation as great as he has seen, and has been largely instrumental in accomplishing, since he began his long and successful musical career!

The Pan-American Temple of Music occupies a plot of ground one hundred and fifty feet square. The building is octagonal and has a seating capacity of two thousand two hundred. It is provided with one of the finest organs in the world.

J. H. Hahn, chairman of the Program Committee, of the Michigan State Music Teachers' Association, has secured an array of artists and educators of the first rank in each specialty, and it will be promptly understood from the annexed list of participants that exceptionally attractive programs will be presented. Negotiations are still pending with other artists, and this announcement is simply preliminary. Pianists, Howard Brockway, New York; Constantin von Sternberg, Philadelphia; Arthur Depew, Detroit; Arthur Bostick, Ypsilanti, Mich.; Edna Apel, Detroit. Essayists, N. J. Corey, Detroit. Vocalists Sidney Lloyd Wrightson, Chicago; Maurice De Vries, Detroit; Edyth Belmont Lott, Detroit; Miss Esther H. St. John, Detroit; Miss Cora Cross, Detroit; Fred. Ellis, Ypsilanti; W. H. Neidlinger, Highland Park, Ill.; Belle Louise Brewster, Bay City, Mich. Orgauists, A. W. Platte, Saginaw; Lewellyn Renwick, Ann Arbor; Stanley R. Gaines, Cleveland. Violinists, Henri Ern, Detroit; Ella Schroeder, Detroit. 'Celllst, Miss Emma McDonald, Detroit; Public School Music Section in charge of Mrs. Emma A. Thomas.

ABROAD.

Clara Butt will not sing in public until September next.

"Angelo," an opera by Caesar Cui, was received with marked favor in Warsaw.

Mr. Jean Gerardy, the Belgian 'cellist, is announced as about to tour Australia.

A new opera by Leoncavallo, "Zaza," has had its first performance in Turin, Italy.

"The Nibelungen Trilogy" will be given in Turin in its entirety for the first time.

Crag-y-Nos, the castle in South Wales, belonging to Mme. Patti, is to be offered at public sale June 18.

Two scores by Mozart, of hitherto unknown quartets, have been discovered in a second-hand shop in Venice.

Etelka Gerster, once as famous a colorature singer as Melba is still living in Berlin, where she has established a music school.

W. H. Bell, a brilliant young composer scarcely in his twenties, is commissioned for an orchestral work for the Gloucester Festival in the autumn.

Paderewski's "Mauru," opera in three acts, is in rehearsal in Lemberg, Austria. The date now announced for the first performance is June 5.

"Weihnacten," opera by Alberto Gentill, has had its initial performance (Munich). The composer, a native of Venice, is but twenty-five years of age.

Eduard Strauss' orchestra has been disbanded and the well-known director has retired. The position as Court Ball Director was created, in 1846, for Johann Strauss.

Arrigo Boito's Opera, "Nero," is to be given at La Scala in Milan. The Paris Opera has signified its desire to give the work immediately after its initial performance in Italy.

Another great musician is to have a monument in Vienna. Johannes Benk is at work on a marble monument to Johann Strauss, which he expects to complete by October.

"Paradise and the Peri" will be performed at the unveiling of the monument to Robert Schumann, at Zwickau, June 8. Carl Reinecke has written an overture to be performed on this occasion.

Hans Richter is to conduct a Wagner concert at St. James Hall, London, June 10. Selections from all the operas and music dramas, from "Rienzi" to "Parsifal," will be given in chronological order.

Dvorak's new opera, "Roussalka," has lately been produced at Prague with great success. The subject is taken from an old Sclavic legend. The scenic arrangements are said to have been very brilliant.

"Roland of Berlin," opera by Leoncavallo, is to be heard in Berlin. The libretto is founded on the story of Margrave Frederiek, of Brandenberg. The opera was written at the order of Emperor William.

The Oxford and Cambridge Musical Club has recently given a dinner to Dr. Joseph Joachim on the occasion of the celebrated violinist's first visit to this country since his election as president of the club. The Lord Chief Justice (Lord Alverstone) presided.

Hans Richter will conduct some of the performances at Bayreuth, presumably the first cycle of "Der Ring," which was originally produced under his direction just twenty-five years ago. The other conductors will be Dr. Muck and Herr Siegfried Wagner.

Lord Alverstone follows a succession of musical judges, among them the late Justice Chitty and the late Lord Hershell. He still sings (tenor) at the Kensington Church and is regular in his attendance at the Abbey Glee Club and other musical societies to which he belongs.

Admirers of Grieg will be glad to hear that he is quite well again. At the unveiling of the Ole Bull statue in Bergen, Norway, the other day, he conducted the first performance of his new cantata written in honor of that famous violinist, who, like Grieg, was born at Bergen.

Antonio Ceppi, once a tenor of the Grau Opera Company, died lately in Turin. He was 31 years of age and leaves a widow. Ceppi was for many years a prize fighter and did feats of strength in the Italian music halls. Some one discovered his voice and he was induced to study music, but though he had a voice of unusual power and beauty and might have been a great singer, he took little pleasure in his art, passing most of his time in the society of acrobats.

The first of the projected "In memoriam" concerts in London fell rather flat, and although Marchesi and Ben Davies were singing, the attendance was not good. The first part was taken from the Requiem, the quartet being completed by Gertrude Calvert and Thomas Meux. In the second part to airs from the operas "Alda," "Traviata," "Il Trovatore," and "Don Carlos," was added the duet from "Otello," and the quartet from "Rigoletto." The effect was rather unsatisfactory. A program offering more relief might have been devised. Both of the chief singers were in excellent form.

At a meeting of the Abbey Glee Club at Westminster, the Lord Chief Justice introduced a charming example by John Hullah, which has never been published in this country, but which he had just discovered in a German edition; it is termed a dirge: "If thou wilt ease thine heart." In all 14 glees and part songs were sung, among them being comparatively modern compositions such as "How beautiful is night" (Harper Kearton); "All hail! Queen of night" (Martin); and "When evening twilight" (Hatton). For the rest Stevens, Beale, Bishop, Callcott, Spofforth, Averio, Reichardt and Barnby supplied choice fare.

PUBLISHERS COLUMN.

The free, erratic flight of the butterfly is well portrayed in the opening piece of the music supplement. Light and graceful is "Amour de Papillons," by W. F. Siep. It demands delicacy of touch and clearness of tone to properly produce its effect. "Life's Mystery," by Joseph L. Roeckel, is a good example of this well known song writer's work. It is interesting and will appeal to both singer and listener. "The Flight of the Dragonfly," by Oscar Köhler, is a dainty characteristic piece of tone portrayal. It well illustrates the darting flight of the dragonfly, and is a good study in arm control. "Love's Sweet Whisper," by Frank Hobson, is a decidedly attractive song. It suits the voice and inspires the singer. It can be made very effective. The duet, "Chime of Bells," by Géza Horváth, is a quaint gavotte, pleasing in rhythm, melody and harmony. Its arrangement for four hands makes it particularly effective, if it be played with discrimination and intelligence. A good staccato and proper phrasing are essential. "The Miller's Song," by Imre Székely, attracts by its freshness and bright cheeriness. It is a good study in repeated notes. The next piece, full of jollity, is well named, "Oh! Such Fun Waltz," by O. R. Blum, runs over with good nature. It is easy and melodious.

The supplement is closed by a "Short Service Prelude for the Organ," by Wm. Horatio Clarke, which is described in the pages devoted to the organ department.

***

THE MUSICIAN for June unites, to a considerable degree, the entertaining and instructive. Its pages are well filled with articles of an educational nature; these are supplemented by a little lighter reading, from which the mind can gain relaxation and renewed vigor. The M. T. N. A. announcements and the report of the important Bach Festival at Bethlehem, Pa, are of wide interest. In addition to these, the numerous short articles are pithy and stimulating. As our readers are looking forward to their vacation period, the publishers hope they will take THE MUSICIAN with them.

***

Our Latest Publications are both practical and useful. "Modern Foundation Studies" and "Modern Studies in Phrasing and Interpretation," both by W. F. Sudds, are the outcome of the author's experience of many years' teaching, and young teachers should give them the careful attention they deserve. "Fingering," by Gordon Saunders, is a comprehensive and extended work in this important branch of piano playing. The author's treatment of the subject, illustrated by extracts from the works of celebrated authorities on pianistic art, is practical, clear and pointed.

Other important works are in preparation. Our aim is to publish and supply the BEST, and our success in obtaining and holding trade is evidence that we are tending in the right direction.

***

The Musician's Premium List. This list, made up of musical works and articles needed by all musicians—students as well as teachers—offers some remarkable inducements. With but little effort, each of our subscribers can secure one or more new subscriptions, and we offer liberal premiums for any interest they may take in extending the circulation of this journal. Send for the list, and build up a library of choice musical works without the expenditure of any money.

***

This issue of THE MUSICIAN will reach our readers as they are preparing for the long vacation. With it go the best wishes of the publishers and editor that its readers may have a period of mental and physical recuperation. Rest is not in idleness, but in change of scene and labor. Take the opportunity to furnish your mind with new ideals, new thoughts, more concentrated powers.

***

Our Publications are noted for correctness and beauty. We carry a complete line of all Foreign and American publications. Our facilities for promptly filling all orders are unequalled.

Our *Special Novelty Offer*—an original plan by which you can obtain one copy each of our new sheet music publications at nominal cost—will interest you. Full particulars will be sent upon application.

***

The Children's Corner—E. Hasse, Op. 52 (Hatch Edition No. 73) is the latest addition to our series of standard works. It is a collection of Ten Easy Pieces, all of which will be found interesting and useful for pupils of the second grade. Send for a copy—subject to examination.

As a representative or agent of The Musician, vacation season can be made profitable. It makes no difference whether vacation is spent at home, in the country, in the mountains, or at the seashore, musicians—professional and amateur, teachers and students—will be found at all places. While THE MUSICIAN has a very large and constantly increasing circulation, nevertheless this is an immense country and our journal is known to only a small percentage of those who should be acquainted with it and the good work which it is doing. An hour or two each day, devoted to soliciting subscriptions, will pay. We have agents who give only a portion of their time to the work and they obtain from 30 to 40 new subscribers each week. THE MUSICIAN appeals to all who are interested in music, to the student as well as the teacher, and it is an easy matter to take subscriptions. Its price is another consideration. $1.50 per year is a trifling amount for twelve numbers of a journal which contains 288 pages of sheet music and 480 pages of musical literature, of a high order of excellence. The quality, as well as the quantity, of matter, is unequalled by any similar publication. Sample copies, order blanks, receipts, full particulars regarding commissions, and all other information will be promptly furnished those who wish to act as agents.

***

Wants.—The time is at hand when it will be necessary to make plans for next season. Teachers who desire to make changes, and schools and colleges needing new or additional help, should take advantage of the *Want Column* of THE MUSICIAN. Wants not exceeding five lines are inserted free, and but a nominal charge is made for advertisements exceeding this limit.

As much space as may be needed to help its readers secure positions or obtain help will be used.

***

Special Notice: According to the conditions upon which music is sent "*On Sale*," returns and settlements are due in June of each year. Unless otherwise specified at the time of shipment, all unused and unsold music sent out during the twelve months ending with the first of the present month, should be returned prior to July 1st. Customers will oblige us by making *prompt returns*. Compliance with this request will enable us to give proper credit and render a full and complete statement of amount due and payable prior to the first of next month.

In order to avoid errors and to insure proper credit, *write your full name and address* (preceded by the word *From*) on all returned packages. Please address packages *plainly*, as follows: Hatch Music Company, 8th and Locust Sts., Philadelphia, Pa. Customers residing at considerable distance may find it cheaper to make returns by mail. If so, make them up in four-pound packages—*Flat. Do not return music in rolls.*

***

Music on Sale for the Summer Months.—With many teachers the summer months are the busiest of the year. We supply selections of music for use during these months, and returns need not be made until October 1st. A majority of publishers object to sending music "on sale" during the summer, hence our offer may be appreciated. Complete catalogue from which you can make up your own selection, if you prefer to do so, will be sent upon request, or we will make the selection on receipt of information as to as to number of pupils, grades, style of music desired, etc.

***

Are You Certain that you are buying your music at as good rates of discount as your fellow teachers? If not, you are doing business at a *disadvantage*. *We claim* that the discounts we allow teachers are MUCH BETTER than offered by other dealers, and unless you have had our latest quotations, you *cannot* be sure that you are not paying *more* for your supplies. This applies not only to our own publications, but to ALL the music you use. On our own publications we offer such liberal discounts (which will be supplied on request) that, no matter how far distant you are, or the cost of Postage or Express, we GUARANTEE you a saving when purchasing from us. In this connection you should remember that we send liberal selections of the latest and most desirable music "ON SALE," with the privilege of returning and having credited, at the end of the teaching season, all that has not been sold or used. Full particulars regarding this department of our business may be had on request. We also offer numerous additional advantages which it is impossible to mention in the limited space of this page. *Write us!* No trouble to answer your letters and inquiries. It will pay you to correspond with a house that is progressive and up-to-date in all of its dealings. We can save you time, trouble and money. We suggest that you give us an opportunity to demonstrate this fact by sending us a trial order, it will bring us your steady patronage.

THE MUSICIAN *wants to keep in close touch* with teachers and schools in all sections, and the editor believes that space devoted to reports of concerts, recitals, lectures on musical subjects and musical events of general interest would prove interesting to readers. You can aid him in making an interesting feature of this department by sending reports of musical happenings that will interest your fellow teachers in other localities.

***

Agents Wanted.—THE MUSICIAN wants good, live representatives to solicit subscriptions. Those having a knowledge of music preferred. Full particulars, including sample copies, order blanks, other helps and terms, will be sent to all who desire to make a trial of this work. No other field of subscription work offers such liberal inducements.

***

Our Offer to send a complete set—seven grades—of the "National Graded Course" (together with a specially prepared pamphlet entitled: "Hints for Obtaining the Best Results in Using the National Graded Course") subject to examination and approval, without any obligation to purchase, is still open. Hundreds of teachers and schools, now exclusively using this Course, became acquainted with its merits by taking advantage of our offer. It bears examination, and the longer it is used, the better it is liked. The "National" is gradually taking the place of other works, and is rapidly becoming the standard method of instruction for the piano. Why not allow us to send you a complete set (seven numbers), so that you may carefully examine the works during vacation. We are confident that it will please you, and that you will conclude to use it—that's our experience with all teachers and schools to whom it has been sent for examination, and comparison with other courses.

THE BURROWES MUSICAL KINDERGARTEN METHOD

INSTRUCTION FOR TEACHERS BY HOME STUDY

The many Music Teachers who have signified their desire to acquire this charming method in time for their September Openings are advised as follows:

1. Orders should be sent in as soon as possible.
2. The new, improved and enlarged edition of the Teachers' Manual is ready for distribution.
3. It is well for teachers to familiarize themselves with the method early so that they can spread its fame during July and August, and try and get some newspaper notices They will then be able to begin the autumn term with better prospects of great success.
4. Teachers may apply the Method to their summer classes, and thus obtain testimonials from parents, which will prove of great value in obtaining pupils for the autumn classes. Do not underestimate the value of an early beginning.

THE BURROWES METHOD was built up for children and from actual study of the needs, preferences, character, and even the whims of children. The authoress has taught a musical kindergarten for many years, during which she has composed songs, invented games, and constructed apparatus too numerous and varied to mention or describe; and of these only the most valuable have been retained. Everything that was dull, cumbersome, ineffective, or unchildlike has been abandoned, and what remains has been tested through and through, and its value proved beyond the shadow of a doubt. There is nothing in it that is not agreeable and entertaining. **IT IS NOT BUILT ON MERE THEORIES.** It is not the inspiration of a day. It is, on the contrary, the **CREAM OF FIVE YEARS OF SPECIAL EFFORT,** and the fruit of many other years of toil and study. The results speak for themselves.

MUSIC TEACHERS OF ALL GRADES should investigate this work. **ADVANCED TEACHERS** will profit largely by establishing kindergarteus in charge of an assistant or partner, thus creating a preparatory department which will act as a feeder to the advanced classes. The advantages of the Method to **YOUNG TEACHERS** are obvious.

All Teachers who have not seen the Art Souvenir Booklet (mailed Free to Teachers) should send their addresses at once.

KATHARINE BURROWES, A 1302 PRESBYTERIAN BUILDING, FIFTH AVENUE, NEW YORK.
WESTERN ADDRESS, 618 SECOND AVENUE, DETROIT, MICH.

Fletcher Music Method

(SIMPLEX AND KINDERGARTEN)

The aim of the Method is to eliminate the drudgery of the study of music and to give a fundamental, systematic and logical musical education in a thorough, natural and pleasurable way; and so make it possible for Music to exercise her three-fold power of development. The System was originated by Evelyn Ashton Fletcher, and the following are a few of the many endorsers and a partial list of the Conservatories in which the System has been adopted.

Dr. Wm. Mason, New York.
Mrs. John Vance Cheney.
Madame Hopekirk.
Philip Sousa.
Franklin Taylor.
Dr. Gerrit Smith, New York.
Wm. Tomlins, Chicago.
Dr. Hugo Riemann, Leipsic.
Dr. Wm. Cummings, London, Eng.
Thomas Tapper.
Kate S. Chittenden, New York.
And others.

University of the State of New York.
Institute of Applied Music, New York.
Departments—**Metropolitan College of Music, Metropolitan Conservatory of Music, American Institute of Normal Methods, Synthetic Piano School, Fletcher Music Method.**
American Conservatory, Chicago.
Gottschalk Lyric School, Chicago.
Mrs. John Vance Cheney School, Chicago.
Detroit Conservatory.
Broad Street Conservatory, Philadelphia. And others.
Also in the Eleven Leading Conservatories or Colleges of Music in Canada.

There are already over 250 teachers of the System, but the demand is greatly increasing Miss Fletcher studied for five years in Europe, and has already successfully introduced her System in the European centres, Leipsic, Berlin, Brussels and Paris. Special advantages to those willing to go abroad with the System. The different sets of apparatus invented by Miss Fletcher are fully protected by patents in Canada, the United States, England, Germany, France, Switzerland, etc. This System can not be taught by mail, and the Fletcher certificate of authorization to teach is only obtainable, with the apparatus, by taking the course of instruction. Write for information and circulars with letters of endorsement, to Miss Evelyn Ashton Fletcher, 1125 Madison Ave., or Mrs. E. A. Sturgeon, 5155 Cornell Ave, Chicago, or to the Corresponding Secretary of the Fletcher Musical Association, Miss La B. Brown, the Nightingale, Dudley St., Roxbury, Boston.

MODERN STUDIES
In Phrasing and Interpretation.

By W. F. SUDDS.

It is now very generally admitted that a separation of the mental and physical features is the best plan for imparting instruction in the study of music. Both may be studied at one time, but it is a mistake to suppose that mental training is the result of physical effort.

To insure proper performance of a composition, the mental concept must be perfect. A pianist possessed of brilliant technic, acquired only by long and faithful practice, may mar a good work because of inability to interpret the author's ideas, just as one may recite the *words* of a poem without a proper appreciation of their meaning and without a correct grouping into phrases. To thoroughly enjoy a musical work one must be able to analyze it, and "Modern Studies in Phrasing and Interpretation" presents the means of doing this in a most comprehensive and intelligent form.

Want of space prevents a detailed description, but we shall be glad to send the work subject to approval, so that any one may test our assertion that this is a thoroughly modern and practical exposition of the subject.

FOR ANYTHING NEEDED IN MUSIC.

What Mr. W. S. B. MATHEWS says in "MUSIC," January, 1901.

MUSICAL RHYTHMS FOR PIANO, For Educational Purposes. By Arnold D. Scammel. With an Introduction by Mrs. Crosby Adams, Chicago.

A collection of fifteen little pieces, of about two pages each, all in sprightly rhythm, mostly dances, and named with nursery titles, such as: "The Wunk's Party," "Pussy Cat Gavotte:" "March of the Hoogie Googies," "The Doodle Bug's Charm," etc. They are designed to please children when played to them. It is even thought that such examples of music might be learned by the older little ones, in connection with their playing lessons. The book therefore appeals to a large constituency. From the standpoint of invention, the music is very good. Some of the pieces might have been written by Ethelbert Nevin, so well are they done from a melodic standpoint. It appears thus that the term "Musical Rhythms" covers only a small part of the contents of the music.

In her charming introductory essay, Mrs. Crosby Adams writes in a cultured way of the desirability of giving young pupils music with pleasing rhythms—an educational idea which nobody disputes, the only difference lying in the inability of some teachers to ascertain what it is which will interest the child. Upon another occasion this essay will perhaps be reproduced. All the pieces in this collection lie below the close of the third grade of piano; and, considering their number and the limitations purposely imposed, they contain an unusual proportion of variety. Therefore, the author is to be praised. The publisher also deserves a word, since not only has he made a most attractive exterior (the die for title being a remarkably clear-cut and fine-looking one), but the whole typographical execution is admirable and the price, one dollar, very reasonable for a collection of thirty-five well printed pages.

WITH
Practical Suggestions
TO
Students of Music.

Is Entirely New and Superior to Anything of Similar Character That Has Ever Been Offered.

The Tablet is 6⅞ x 10⅜ Ins.

It contains 100 Sheets—each with 12 staves. The paper is first-class—suitable for writing with either pen or pencil. The leaves are perforated so that they can readily be removed. Second page of cover contains, for ready reference, the following: Notation, Display of Tetrachords, Cycle of Keys, Condensed History of the Minor Scale, Relationship of the Minor Scale. Manchester's is so much superior to all other tablets, that an examination will insure its use.

Price, 20 Cents.
By Mail, 28 Cents.

Liberal discount when ordered in quantities.

Carcassi's Complete Method for the Guitar

So far as the musical public is concerned, there is no excuse for a new edition of an old favorite unless it offers some special advantage. It must be superior to all other editions if it is to supplant them. By the use of new plates, an excellent quality of music-book paper, careful presswork and substantial binding, we have produced a book which cannot fail to take the place of the inferior editions so long in use. Compare ours with that which you have been using; nothing more is needed to win your favor. The cover of our edition is illustrated by a guitar and a full scale of the instrument. *English and French Text.*

Half Cloth Binding. Price, $1.50.

Musical Memory and its Cultivation

Also an Investigation into the Forms of Memory Employed in Pianoforte Playing and a Theory as to the Relative Extent of the Employment of Such Forms

By FREDERICK G. SHINN, Mus. Doc., Dunelm.

The purpose of the work is twofold: *First*, an inquiry into the various forms of memory employed in piano playing and the formation of a theory with regard to the relative extent of the employment of the various forms by different individuals. *Second*, to repeat, with the strongest possible emphasis, that Ear-training, which is largely a cultivation of the musical memory, is THE FACT of all musical education.

"MUSICAL MEMORY AND ITS CULTIVATION" is divided into two parts. *Part 1* contains seven chapters, as follows: General and Special Memory; Musical Memory; Musical Memory in Connection with Practical Execution; Muscular Memory; Visual Memory; Intellectual Memory; Relative Extent of the Employment of the Different Forms of Memory. *Part 2* contains six chapters, as follows: Necessity for the Cultivation of Musical Memory; General Conditions Favorable to Memorizing; Suggestions for a Scheme of Memory Training; Method of Studying Pieces for Memorization; Memory Training and Examination Schemes; Memories of Musicians.

A valuable work which should be read and studied by all musicians.

Paper Binding. Price, 50 Cents.

CLASSIC PIANO SOLOS

VOLS. 1-2.

Superb Collections by Eminent Authors.

While the contents of Volume 1 is largely made up of the works of the older masters, with but few exceptions the pieces included in Volume 2 are the works of the more modern classical writers, many of whom are still living. All of the compositions of both volumes are within the capabilities of the ordinarily good performer and will be found most interesting whether used for purposes of recreation or instruction. We ask a critical examination and comparison with works of similar character.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

Sieber's 36 Elementary Vocalises

Op. 92-97 Inclusive

FOR SOPRANO, MEZZO SOPRANO, ALTO, TENOR, BARITONE AND BASS

With Introductory Notes by FREDERIC W. ROOT.

Sieber's 36 Eight Measure Vocalises, for all voices, are well known and appreciated by teachers. The composer had a double object in view and prepared them for use in the school, as well as for self-study at home. The book for each voice differs from the companion volumes, as the exercises were written with especial regard for the voice part under consideration. Each study is contained within eight bars—therefore do not become tedious—and are written with the *sol fa* syllables, also with an ingenious and effective set of vowel sounds designed by the composer, who is a teacher of European celebrity. All of his studies are melodious and interesting.

Our new edition is, in every respect, the finest in print. These studies have, heretofore, been published only in sheet music form, at $1 50 each. While our new edition is of much more convenient size and much handsomer in every way, it is sold for 50 cents per copy.

Mr. Frederic W. Root says: "The new edition of Sieber's Exercises are beautifully gotten out and I hope will be properly appreciated. I congratulate you upon the edition and hope to use it in my teaching for many a year."

Paper Binding. Price, 50c. Each.

Classic Piano Solos for Young People

VOLS. 1-2.

ELEGANT COLLECTIONS BY WELL-KNOWN WRITERS.

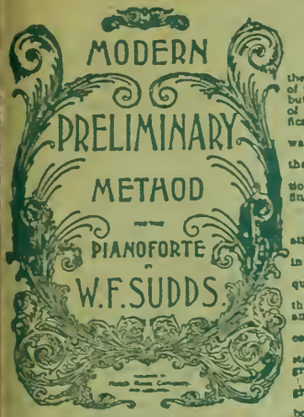
Classics selected for the young are frequently of the dryest character and students are too apt to absorb the idea that good music *must be dull*. In the preparation of these collections the requirements of the youthful mind were kept in view, and the selection of works will prove that music of an advanced standard can be pleasing as well as useful in the formation of a correct and pure musical taste. These works are unequalled by any similar publications of corresponding grade. A critical comparison will establish our claims of superiority.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

Standard and Popular Books Published and For Sale by the Hatch Music Company.

MODERN PRELIMINARY METHOD
FOR THE PIANOFORTE

Embodying the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation



By W. F. SUDDS.

As its title implies, this Method is modern, contains the newest ideas and their practical application. The bulky and voluminous instruction book is a thing of the past. The Method of to-day deals with more subjects than its predecessors, but deals with them in a terse and effective manner. It recognizes the importance of practical exemplification of the principles involved, but wisely leaves the amplification of various points to future study.

Among the many excellent features of the Modern Preliminary Method, we direct attention to the following:

The Rudiments are very progressive and explained with such clearness that the pupil cannot fail to comprehend them.

The Various Touches are clearly set forth and are accompanied by illustrations, drawn and engraved expressly for this work, showing the movements of finger, hand and arm.

The Correct Principles of Touch and Technic are illustrated by examples.

The Scales are introduced in an effective manner.

Proper Use of the Pedals, a matter generally disregarded, is given particular attention.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

Five-finger Exercises are judiciously used, but not in the usual enormous quantity that disgusts and discourages the pupil.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a Complete Preliminary Method—a work which cannot fail to interest both the practical teacher and the earnest student.

MODERN PRELIMINARY METHOD is the result of many years' experience as a teacher, by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates on the best grade of music-book paper.

Half Cloth Binding. Price, $1.00.

Magnificent Editions of Standard Piano Methods

Particular attention is called to the "HATCH EDITION" of the works named below. No expense has been spared in the preparation of this edition. While all have been carefully edited by teachers of national reputation, prices have not been increased. The best is, therefore, offered at the cost of inferior editions.

Köhler's Practical Method for the Piano. Op. 249. Vols. 1-2-3. Paper Binding. Each $ 75
Revised, Fingered and Annotated by Thos. a'Becket.

The only ANNOTATED edition: the only edition in which the PHRASING is presented in accordance with the latest and most advanced ideas; the only edition that has had a comprehensive and thorough revision.

Löw's Practical Four Hand Piano Method. Vols. 1-2 . . . . . Paper Binding. Each $ 75
Revised, Fingered and Annotated by Wilson G. Smith.

Designed as a companion to all books of instruction for the piano, this method is a favorite with teachers. The perfect ensemble players are those who blend their individual characteristics in order to form a perfect whole, and this important accomplishment may be obtained by careful and conscientious study of Löw's Method.

Wagner's First Instructor for Young Beginners. Vols. 1-2 . . . Paper Binding. Each $ 75
New and Revised Edition. English and German Text.

This work, designed for the instruction of young beginners, presents a thorough and exhaustive course for the systematic training of children. The original edition (published with German text only) is a great favorite with leading German teachers in this country, while it holds a commanding position in Germany where it is a recognized standard not only for children, but for adults who take up the study of the piano.

All works included in the "HATCH EDITION" are printed from new plates. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Ask for the "HATCH EDITION," and take no other if you want the best.

KULLAK'S SEVEN OCTAVE STUDIES
From the School of Octave Playing. Op. 48, No. 2.

Revised and Annotated, with Introduction and Practical Directions for Study, by

WILLIAM H. SHERWOOD.

While numerous exercises for the practice of octaves have been presented to the musical world by virtuosi and masters Kullak's is the only method or "School" of octave playing that has become a standard. But good as they are in their original form, it is remarkable how much the usefulness of these studies has been enhanced by Mr. Sherwood's revision and annotations. A broad foundation embodying the general principles involved and the method by which the end may be most satisfactorily attained is laid in his Preliminary Remarks; instructions and suggestions for technical preparation are given in his "Notes on the Studies;" each study is *treated in detail*. Each movement of the hand and arm is designated by an ingenious device and these characters, elaborately used throughout the text, show the student *exactly* how the hand should approach and leave the keyboard in performing various passages. The progressive teacher will appreciate the importance of Mr. Sherwood's editorial work, and especially so since he gives, for the first time, his system of of instruction in octave playing.

Regardless of the great expense involved in the preparation of this edition, the price is the same as that charged for the ordinary reprint.

Paper Binding. Price, $1.25.

Magnificent Editions of Piano Studies

Particular attention is called to the "HATCH EDITION" of the works named below. No expense has been spared in the preparation of this edition. BUSSLER'S PRACTICAL HARMONY
Newly Revised and Corrected Edition
Authorized Translation from the Third German Edition by N. GANS.

Without exception, the best and most practical work on this subject ever published. The author is a noted German theorist, whose works are known, used and held in high esteem at all the most prominent European colleges and conservatories. The demand for PRACTICAL HARMONY has been so great that three revised editions have been printed in Germany. Ours was translated from the third German edition, by a writer selected by the author. It is, as its title indicates, a thoroughly practical work, embracing the latest and most approved methods. It is simple, is illustrated by practical examples, and is eminently suited for a self-instructor. Its price brings it within the reach of all.

For class instruction or for self instruction, Bussler's Practical Harmony is unequalled. It makes the study of harmony easy, rapid and entertaining.

Cloth Binding. Price, $1.00.

THE HARMONIZING OF MELODIES
A Text Book for Students and Teachers
By HENRY C. BANISTER.

The harmonizing of melodies, generally termed the knowledge of harmony, is one of the most practical applications of the knowledge of chords and their treatment. One may know the meaning of a number of words and still be unable to construct a sentence: he who lacks the ability to use chords in harmonizing a melody is in a similar position.

"Harmonizing of Melodies" will prove a most helpful aid to the student of harmony. It is extremely practical and abounds in examples which will readily be understood. No point has been overlooked, and all important subjects are treated at considerable length. Various methods of handling the same melody are shown, and valuable information as to the best choice, with reasons for the selection, are given. Many excellent hints as to taste and ornamentation, culled from the experience of the writer, are included.

Paper Binding Price, 50 Cents.

DICTIONARY OF MUSICAL TERMS
By STAINER and BARRETT.

100 Pages. 6 x 9 Ins.

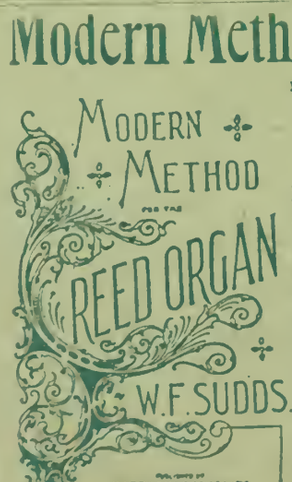
Compressed from the Imperial 8vo Edition, by K. M. ROSS.

We take pleasure in presenting a compressed edition of Stainer and Barrett's valuable work. Mr. K. M. Ross, in his preface, says: "In reducing this book from the author's larger work, we have endeavored to omit only such terms as are not in general use, but have been compelled to eliminate an amount of details, in order to keep within reasonable limits. To the general public it is hoped that this edition will be found of practical utility."

"Dictionary of Musical Terms" is a neat and attractive book. It is offered at a nominal price with the hope that it may prove of incalculable value to those in need of a handy reference book.

Paper Binding. Price, 25 Cents.

Modern Method for the Reed Organ



Embracing the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation; also Containing Various New and Important Features, such as Registration, Stop Nomenclature, Adaptation of Piano Music, etc., etc., Not to be Found in Any Other Work of the Kind

By W. F. SUDDS.

As the title implies, this method is modern, the newest ideas, and their practical application, governing its compilation. It treats all subjects in a terse and effective manner.

Among the many excellent features of the Modern Method, we direct attention to the following:

It begins with Dictated Lessons.

The Rudiments are explained with remarkable clearness.

It is Carefully Graded.

It is sure to Awaken the Musical Instincts of the pupil without smothering the soul with too much drudgery.

The Fingering is the so-called Foreign, thus according with all the better class of modern musical publications for either Organ or Piano.

It contains a complete treatise on registration as applied to the modern Reed Organ; also full information and comparison in the matter of Stop Nomenclature.

It is the only work of the kind treating the subject of Adapting Piano Music to the Reed Organ.

Every variety of Touch is clearly set forth, accompanied by illustrations (drawn and engraved expressly for this work), showing the movements of finger, hand and arm.

The Scales are introduced in an effective manner.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a work which cannot fail to interest both the practical teacher and the earnest pupil.

MODERN METHOD is the result of many years' experience as a teacher by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates and on the best grade of music-book paper.

Half Cloth Binding. Price, $1.00.

Benj. L. Whelpley
Harrison M. Wild
Herve D. Wilkins
Arthur L. Manchester

GRADE 1.

The Corner Stone of the Course.

Table Exercises; Instructions from the Very Beginning, Most Carefully Graded; Difficulties Introduced in Logical Order; Interesting Exercises and Etudes; No Octaves; Exercises for Free Wrist; Major Scales—*Written*, but *not* Played.

GRADE 2.

Introduction of Scale Playing: Exercises for Passing Under the Thumb; Minor Scales Written; Beginning of Arpeggio Work (Broken Chords); Major and Minor Chords Awakening of the Ideal of the Singing Touch; Interesting Etudes; Careful Grading of Difficulties.

The Preparatory Gymnastic Exercises, in Grade 1, are Practical and Helpful.

GRADE 3.

Velocity Assumes Some Importance; Attention Given to the Staccato, while Cantabile Playing Is Carried Along with Equal Care; Etudes Become More Like Pieces; Polyphonic Playing Introduced; Exercises for Weak Fingers in Each Hand.

GRADE 4.

Polyphonic Playing Carried Forward; Rhythmical Problems (Two Against Three) Introduced; Greater Richness in the Etudes; Etudes for Melody Playing, Rapid Runs, Trills, Arpeggi, Marked Rhythms, Extreme Agility, Fourth and Fifth Fingers Interest Maintained Throughout the Grade.

GRADE 5.

Musical Material of Great Beauty; Etudes for Left Hand, Octaves, Polyphonic Playing, Staccato, Double Notes, Grand Arpeggi, Fourth and Fifth Fingers. In Singing Tone, Touch, Velocity and General Intelligence, Much More is Demanded of the Pupil.

GRADE 6.

Etudes for Extended Finger Touches, Staccato, Doubl Notes, Extreme Rapidity in Staccato and Runs; More Attention Given to Octaves; Pupil's Task Steadily Increasing in Difficulty—Greater Requirements in Regard to Touch, Interpretation, Color and Phrasing.

GRADE 7.

Pieces and Etudes by Saint-Saëns, Henselt, Kullak, Chopin, Mendelssohn, Raff, Alkan and others. These, Making Greater Demands upon the Pupil, advance his Technical Skill to the Highest Efficiency and Insure Ability to Interpret the Greatest Works for the Piano.

Several Opinions.

WILLIAM H. SHERWOOD: I am happy to state that the "National Graded Course" is remarkably adapted to the needs of teachers and students of music. Your claim in regard to the excellent grading of the studies is a thoroughly just one. I do not think that I have ever seen as good a succession of topics and exercises arranged as they are from the beginning on, using the best kind of materials from all sources and without any superfluous pages.

WILSON G. SMITH: I have been particularly impressed with the practical value and uniform excellence of the "National Graded Course."

AD. M. FOERSTER: The "National Graded Course" is destined to hold a foremost position among the works of its class. I do not know of a better work, one containing a more interesting and valuable selection of studies and pieces for the various peculiarities to be mastered. A list of desirable pieces that may be added to each part, if found necessary, is given in each grade, also definitions of all musical terms used in this work. The work is bound to find favor with thoughtful teachers and students.

O. R. SKINNER: I like the "National Graded Course" much better than any other work I am familiar with. The editing seems to be thoroughly well done, and the print leaves nothing to be desired.

(Want of space alone prevents printing the opinions of hundreds of well-known teachers in all sections of the United States and Canada.)

It Will Help YOU in Your Teaching.

Because

- It embodies the work of the most eminent pianists and teachers in America.
- It can be readily adapted to your "method," no matter what that may be.
- It is the LATEST work of the kind.
- ALL of the studies are carefully annotated, fingered and edited.
- It is the most carefully graded of any course before the public.
- It begins at the beginning of study.
- It saves the time that otherwise would be spent in laborious and often unrewarded search after that which is good and up-to-date.
- It covers the entire field of piano literature in an eminently practical, interesting and stimulating manner.
- Hundreds of your fellow teachers from all parts of the country have sent us, unsolicited, enthusiastic commendations of these very features.

This complete work (7 grades) together with a specially prepared pamphlet entitled: "Hints for Obtaining the Best Results in Using the National Graded Course," will be sent upon request, subject to examination and approval—without any obligation to purchase.

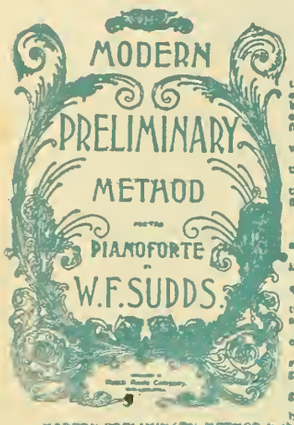
MODERN PRELIMINARY METHOD
FOR THE PIANOFORTE

Embodying the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation



By W. F. SUDDS.

As the title implies, this Method is modern, contains the newest ideas and their practical application. The bulky and voluminous instruction book is a thing of the past. The Method of to-day deals with *more* subjects than its predecessors, but deals with them in a terse and effective manner. It recognizes the importance of practical exemplification of the principles involved, but wisely leaves the amplification of various points to future study.

Among the many excellent features of the *Modern Preliminary Method*, we direct attention to the following:

The Rudiments are very progressive and explained with such clearness that the pupil cannot fail to comprehend them.

The Various Touches are clearly set forth and are accompanied by illustrations, drawn and engraved expressly for this work, showing the movements of finger, hand and arm.

The Correct Principles of Touch and Technic are illustrated by examples.

The Scales are introduced in an effective manner.

Proper Use of the Pedals, a matter generally disregarded, is given particular attention.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

Five-finger Exercises are judiciously used, but not in the usual enormous quantity that disgusts and discourages the pupil.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a Complete Preliminary Method—a work which cannot fail to interest both the practical teacher and the earnest student.

MODERN PRELIMINARY METHOD is the result of many years' experience as a teacher, by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates on the best grade of music-book paper.

Half Cloth Binding. Price, $1.00.

Magnificent Editions of Standard Piano Methods

Particular attention is called to the "HATCH EDITION" of the works named below. No expense has been spared in the preparation of this edition. While all have been carefully edited by teachers of national reputation, prices have not been increased. The best is, therefore, offered at the cost of inferior editions.

Köhler's Practical Method for the Piano. Op. 249. Vols. 1-2-3. Paper Binding. Each $ 75
Revised, Fingered and Annotated by Thos. a'Becket.

The only ANNOTATED edition; the only edition in which the PHRASING is presented in accordance with the latest and most advanced ideas; the only edition that has had a comprehensive and thorough revision.

Löw's Practical Four Hand Piano Method. Vols. 1-2 . . . . . Paper Binding. Each $ 75
Revised, Fingered and Annotated by Wilson G. Smith.

Designed as a companion to all books of instruction for the piano, this method is a favorite with teachers. The perfect ensemble players are those who blend their individual characteristics in order to form a perfect whole, and this important accomplishment may be obtained by careful and conscientious study of Löw's Method.

Wagner's First Instructor for Young Beginners. Vols. 1-2 . . . Paper Binding. Each $ 75
New and Revised Edition. English and German Text.

This work, designed for the instruction of young beginners, presents a thorough and exhaustive course for the systematic training of children. The original edition (published with German text only) is a great favorite with leading German teachers in this country, while it holds a commanding position in Germany where it is a recognized standard not only for children, but for adults who take up the study of the piano.

All works included in the "HATCH EDITION" are printed from new plates. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Ask for the "HATCH EDITION," and take no other if you want the best.

KULLAK'S SEVEN OCTAVE STUDIES
From the School of Octave Playing. Op. 48, No. 2.

Revised and Annotated, with Introduction and Practical Directions for Study, by

WILLIAM H. SHERWOOD.

While numerous exercises for the practice of octaves have been presented to the musical world by virtuosi and masters Kullak's is the only method of "School" of octave playing that has become a standard. But good as they are in their original form, it is remarkable how much the usefulness of these studies has been enhanced by Mr. Sherwood's revision and annotations. A broad foundation embodying the general principles involved and the method by which the end may be most satisfactorily attained is laid in his Preliminary Remarks; instructions and suggestions for technical preparation are given in his "Notes on the Studies;" each study is *treated in detail*. Each movement of the hand and arm is designated by an ingenious device and these characters, elaborately used throughout the text, show the student *exactly* how the hand should approach and leave the keyboard in performing various passages. The progressive teacher will appreciate the importance of Mr. Sherwood's editorial work, and especially so since he gives, for the first time, his system of of instruction in octave playing.

Regardless of the great expense involved in the preparation of this edition, the price is the same as that charged for the ordinary reprint.

Paper Binding. Price, $1.25.

Magnificent Editions of Piano Studies

BUSSLER'S PRACTICAL HARMONY
Newly Revised and Corrected Edition
Authorized Translation from the Third German Edition by N. GANS.

Without exception, the best and most practical work on this subject ever published. The author is a noted German theorist, whose works are known, used and held in high esteem at all the most prominent European colleges and conservatories. The demand for PRACTICAL HARMONY has been so great that three revised editions have been printed in Germany. Ours was translated from the third German edition, by a writer selected by the author. It is, as its title indicates, a thoroughly practical work, embracing the latest and most approved methods. It is simple, is illustrated by practical examples, and is eminently suited for a self-instructor. Its price brings it within the reach of all.

For class instruction or for self instruction, Bussler's Practical Harmony is unequalled. It makes the study of harmony easy, rapid and entertaining.

Cloth Binding. Price, $1.00.

THE HARMONIZING OF MELODIES
A Text Book for Students and Teachers
By HENRY C. BANISTER.

The harmonizing of melodies, generally termed the knowledge of harmony, is one of the most practical applications of the knowledge of chords and their treatment. One may know the meaning of a number of words and still be unable to construct a sentence; he who lacks the ability to use chords in harmonizing a melody is in a similar position.

"Harmonizing of Melodies" will prove a most helpful aid to the student of harmony. It is extremely practical and abounds in examples which will readily be understood. No point has been overlooked, and all important subjects are treated at considerable length. Various methods of handling the same melody are shown, and valuable information as to the best choice, with reasons for the selection, are given. Many excellent hints as to taste and ornamentation, culled from the experience of the writer, are included.

Paper Binding. Price, 50 Cents.

DICTIONARY OF MUSICAL TERMS

100 Pages. By STAINER and BARRETT. 6 x 9 Ins.

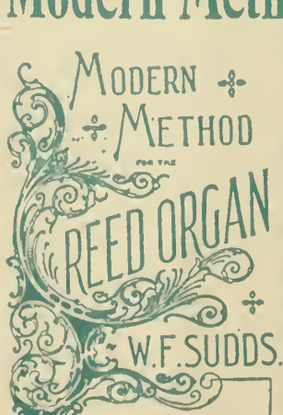
Compressed from the Imperial 8vo Edition, by K. M. ROSS.

We take pleasure in presenting a compressed edition of Stainer and Barrett's valuable work. Mr. K. M. Ross, in his preface, says: "In reducing this book from the author's larger work, we have endeavored to omit only such terms as are not in general use, but have been compelled to eliminate an amount of details, in order to keep within reasonable limits. To the general public it is hoped that this edition will be found of practical utility."

"Dictionary of Musical Terms" is a neat and attractive book. It is offered at a nominal price with the hope that it may prove of incalculable value to those in need of a handy reference book.

Paper Binding. Price, 25 Cents.

Modern Method for the Reed Organ



Embracing the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation; also Containing Various New and Important Features, such as Registration, Stop Nomenclature, Adaptation of Piano Music, etc., etc., Not to be Found in Any Other Work of the Kind

By W. F. SUDDS.

As the title implies, this method is modern, the newest ideas, and their practical application, governing its compilation. It treats all subjects in a terse and effective manner.

Among the many excellent features of the MODERN METHOD, we direct attention to the following:

It begins with Dictated Lessons.

The Rudiments are explained with remarkable clearness.

It is Carefully Graded.

It is sure to Awaken the Musical Instincts of the pupil without smothering the soul with too much drudgery.

The Fingering is the so-called Foreign, thus according with all the better class of modern musical publications for either Organ or Piano.

It contains a complete treatise on registration as applied to the modern Reed Organ; also full information and comparison in the matter of Stop Nomenclature.

It is the only work of the kind treating the subject of Adapting Piano Music to the Reed Organ.

Every variety of Touch is clearly set forth accompanied by illustrations (drawn and engraved expressly for this work), showing the movements of finger, hand and arm.

The Scales are introduced in an effective manner.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a work which cannot fail to interest both the practical teacher and the earnest pupil.

MODERN METHOD is the result of many years' experience as a teacher, by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates and on the best grade of music-book paper.

Half Cloth Binding. Price, $1.00.

THE LORLEI.

Once more the blind magician of the keys
Sits down and plays "The Lorlei." Once again
Under the magic of the master's hand,
I listen to the subtle melody
And the old legend comes before my eyes.

I.

The beautiful Rhine
Flows swift and free;
Her rippling waves
Laugh merrily.
And under the gladness,
With silvery sadness,
Sounds the "inner voice" of the river.

II.

With brown cheeks glowing,
And boisterous glee,
The boatmen ply their oars;
Their hearts are happy and light and free,
They fear no foe on land or sea—
They laugh at the tempest's roars.

III.

But sudden there sounds
On their wondering ears
A song so wild and sweet.
It thrills each soul with a great unrest,
It wakens a longing within each breast—
It quickens each brave heart's beat!

IV.

On the rocks the Lorlei sits,
Combing her golden hair;
And the wondrous song she sings
Fills the boatmen with despair!

V.

Thro' the spray they see her now,
And her beauty lures them along—
And wilder and sweeter, and still more sweet
Rings out the siren's song.

VI.

The waves are dashing!
The rocks are near!
But the Lorlei's song is all they hear!
And over the cruel, cruel falls
With the fatal song still ringing,
They go to death! And still—and still—
The Lorlei is wildly singing!

VII.

Then, shaking her golden hair,
She glides down the flowing stream;
And her wild song dies away
Like the echo of a dream.

VIII.

And the beautiful Rhine
Flows swift and free;
Her rippling waves
Laugh merrily.
But under the gladness,
With silvery sadness,
Sounds the "inner voice" of the river.

A SUMMER REGIME FOR THE PIANO STUDENT.

AIMEE M. WOOD.

"Taking lessons" is so universally considered the gauge and essential factor of progress in music, that the question "Shall the child continue his study in summer?" speedily promotes a discussion of pros and cons. In the opinion of many, who regard "an education" as the chief end of the juvenile estate, a child not under the direct supervision of a teacher, is leading a profitless and aimless existence. The necessity they do not question, as recurring in the vacation seasons, but it means a cessation of progress, nevertheless, and matters are only once more adjusted when the holiday is over, and the student again at his tasks. Parents and friends and teachers who look more deeply, fulfill Carlyle's statement, in the sense of seeing more broadly and harmoniously, and recognize that there must be constant growth, both music-ward, and in all ways for which the foundations have been once rightly established. For the mind, given healthy conditions, is like the acorn, and there can be no stagnation or retrogression. But in the matter of the young student of music being allowed, or expected, to continue study in summer, both those in favor of it, and those against it, are in a measure right. Their arguments are based, however, upon their point of view.

Since activity is incessant, it is well that it be wisely directed, and to the best advantage for the individual, even during so-called periods of rest.

The feverish ambition, awakened by the recognition of the boundlessness of knowledge, and the apparent shortness of time, welcomes the further recognition of the equally limitless energy which it expresses, and which may, by the individual's prerogative of free-will, be directed as he elects. "Rest, change, progress," he writes down as synonyms, and reaps thereafter the results of the added bit of knowledge.

To the child, to the young student, and even to many somewhat advanced, discipline of the energy is an unknown experience. "Tons of energy" are wasted, for lack of this knowledge, and through activities misdirected, not only during the school year, but more especially throughout vacation time. Teachers complain that pupils return to their tasks listless, and unrefreshed. Ways and means must be sought out to awaken, and rekindle the interest. Time is consumed in picking up the dropped threads, and although in many ways the mind has, necessarily, matured, the fluttering attention, the unconcern, the nervous haste and lack of poise, and of ability to directly concentrate the thoughts, tell their own story of weeks of reckless waste of power.

Let rest mean change, and the change progress, for the teacher's sake, as well as the student's. A summer course of study should be arranged by teachers for each pupil. Better if he might have the aid direct, but if lessons are to cease for weeks, the teacher should the more strongly throw his influence about each member of his class, during the interim. A program that is novel, but filled with interest, and adapted especially for each pupil's need, will serve a fourfold purpose, and with even added advantages that can scarcely be estimated. The minds of teacher and pupil will still be working together harmoniously; the influence of the teacher will remain unbroken; there will be also the continued drill in mental and nerve discipline,—in focusing the energies, in concentration, and attaining poise;—and lastly, the unfoldment mentally, physically, æsthetically, will be all that could be desired.

The time to be devoted can be fixed by the teacher's judgment. An hour, daily, would give excellent results, provided drill in concentration had been previously sufficiently thorough.

Instruction for the course to be carried out by the pupils individually, apart from the teacher, may be given in several class meetings held for the purpose. All should be required to be present, and each provided with pencil and paper. The instruction regarding hand, arm, and wrist gymnastics, apart from the instrument, exercises for breathing, for concentration, and for developing mind and nerve control, would occupy little time, if already a part of the teacher's system. They should be performed by the class, all counting the movements aloud with the teacher, and afterward writing them down in their order, together with the time (twenty minutes daily) to be devoted to them during the summer. Next will follow instructions in regard to the practice of the pupil's entire repertoire of pieces, each one of which should have received attention within a week, or period of ten days, and this rule to be followed inflexibly through the season. A book should then be selected for study, presumably a good history of music, and lastly, the æsthetic work may include an original essay, the subject to be chosen by each pupil, and relating to music, and also instructions to be followed in listening and observing, during walks to be taken, if possible, to the woods and fields, for the purpose of studying Nature's harmonies, as expressed in sound and color. The schedule of instructions should be carefully written by the pupil, and if the teacher inform them that he, also, is to carry out the program daily, although separated from them, there will still be added interest, as well as in the plan of which they are told, for a class meeting or reception in the autumn, at which each member will play a piece from his, or her, repertoire, to be selected at random by the teacher; at which questions covering the history they have studied will be asked them, and on which occasion, too, the essays will be handed in for examination, or these may be read by their writers at a subsequent reception or recital.

Pupils whose plans lie apart from the summer school, or the course of private lessons, and carrying out by themselves such a plan of study, even if lacking the teacher's instructions or aid thereto, will find reward in an added vigor, physically, mentally, and musically, before their vacation time has passed.

ADOLF JENSEN'S "ELFIN DANCE," OP. 33.

(A Study in Melic Verse.)

When the Summer night is dusking deeper to her gloomy noon
(*Hush! Hush!*)
And the stars
(*Hush! Hush!*)
Round the moon sing
Magic melodies of gluting colors and enamored fragrances,
'Tis the hour
That we bend
The grey grasses.
Like another tiny thread of silver in the wavy dimness of the robing air
A rivulet purls onward,
With choosing feet and darting eyes
Amid the softest mosses delayed;
'Tis then fantastic weirdness
We hint to men of sagest years,
We threat to maids of gentle breasts
Till in their dreams they suffer
And weep
(*Asleep!*)
And cry
(*Ah, Why!*)
While we with jests are gay.
Oh, join the happy life of the elves!
(*Away, Away, Away!*)
Attend!
(*Nor stay!*)
Ascend!
(*We pray.*)
Below us, lo! the woe men sow and know.
Oh, come to the dells and the bosks of the sky-deeps!
When the Summer night is waning whiter at the dawning day
(*Hush! Hush!*)
And the earth
(*Hush! Hush!*)
Shakes her eyelids,
Then alert of wing and foot we parry darts of fatal morn
And breathe
Well-a-way to the stars and the moonlight!

Buffalo, N. Y. —*Philip Becker Goetz.*

To love and to labor is the sum of living; and yet how many think they live who neither labor nor love. —*The Household of Sir Thomas More.*

Be it true or false, what is said about men, often has as much influence upon their lives, and especially upon their destinies, as what they do.—*Victor Hugo.*

THE Teachers' Forum

Conducted by N. J. COREY

This department is inaugurated for the purpose of uniting the many teachers who read THE MUSICIAN in a bond of professional brotherhood. It is to be their medium for the interchange of ideas, experiences, encouragement, discouragement and difficulties. The fullest correspondence is invited. The questions will be answered and suggestions given by the conductor and the contributions of those who wish to gain new light or to present their methods will be printed. We propose helping ever teacher who will permit us to do so; we intend to do everything possible to overcome the isolation with which you are burdened. Will you co-operate with us?

No conditions are attached; the department is open to *all* MUSICIAN subscribers. Address all communications to the Teachers' Forum, care THE MUSICIAN, Eighth and Locust Streets, Philadelphia, Pa Do not hesitate, but be among the first to ask help, or to give some other teacher a suggestion. Let us know what you would like to have treated in its columns.—Editor of THE MUSICIAN.

'The gates of art are closed unto none; who so entereth thereat, though he seeketh perfection, yet shall he not find it."

—Ancient Egyptian Papyrus, 3580 B. C.

GRACE NOTES AND FALSE NOSES.

N. J. COREY.

The old question as to the proper performance of grace notes of the various sorts keeps cropping up, and probably always will as long as there are new generations continually coming forward to learn the details of their art, and as long as there are pedagogues who insist that everything should remain "as it was in the beginning," regardless of changed conditions, both in the spirit of art and the capabilities of musical instruments. It may be a delicate question to answer dogmatically, when "eminent authorities" disagree so widely upon it, and yet it is a question upon which an opinion needs to be of a decided nature in order to be of any value. As far as present purposes are concerned it will not be necessary to go into the subject deeply, a notice of the simplest ornaments being sufficient. Those who wish to study the subject exhaustively are referred to Dannreuther's two extensive volumes, the very turning of the leaves of which renders one dizzy at the appalling vastness, and may one also add, uselessness of the study. Useless because the spirit of music, and the nature of instruments have so changed as to render most of the signs obsolete and matters of antiquarian research. A page of Couperin's music looks as if an ancient alphabet had been spilled upon it. One cannot help feeling devoutly thankful that it is not necessary to learn them all, but may have some time left for the cultivation of the emotional side of music, and developing that which is spiritually true and eternal.

To my own mind the question has always been an exceedingly simple one, and for the reason that I could never conceive it upon any other basis than that of the natural musical sense, the primary root of rhythm. We have something there upon which we can lean and rely; if it were not so we would belie our musical sensibilities, which should be the ultimate arbiters in nearly all questions of musical taste. Reason is a good thing, but whatever the question on which it would try to throw light, it should never be used alone, divorced from the special faculties that concern the point at issue. Reason as the sole arbiter in musical matters sometimes cuts but a sorry figure.

Tradition is also sometimes a good thing, but unintelligent and wholly without discrimination, for it simply hands down as a matter of record that things once were done so and so. It recognizes no changed conditions or aspects, determines nothing as to the appropriateness of a custom in changed times and conditions, but with an imperturbable re-iterativeness similar to that of Poe's Raven, keeps repeating, "things once were done thus." To a certain order of mind this is sufficient; what custom wills is hallowed forever, regardless of the suggestions of reason and the musical feeling. But by such blind reverence we must become rooted to the spot, and the hands on the clock of progress must stop forever.

> "What custom wills, in all things should we do,
> The dust on antique time would lie unswept,
> And mountainous error be too highly heapt
> For truth to o'er-peer."

In a corner of one of the London parks an officer had been stationed for many decades, walking up and down his short beat apparently from time immemorial, but for what purpose no one could tell. There was absolutely nothing for him to do, no purpose in his position, a function without duties. At last it occurred to some official to look the matter up in the records, and it was thereby discovered that two or three hundred years previously a man had been stationed at that place to warn people from sitting on a newly painted bench. The act authorizing the commission had been placed on the official books and its removal when no longer needed forgotten. Hence as often as the post became vacant a new incumbent was appointed simply because it was a legally authorized custom. Such is the pertinacity of custom, and people forget to give up useless habits even when there ceases to be any further need for them.

In like manner tradition has sent a good many ideas "snoring down the centuries;" musty and time-eaten, and yet how carefully treasured by the "professors"! How some of them do love the raven with its "nevermore," which they interpret to mean that things must nevermore be changed, and how they do blind their eyes to the spirit of truth that might enlighten them if they would but cultivate and examine their own musical natures, and thereby discern the spirit of truth that lies at the basis of modern art, instead of laboriously trying to reduce to a mathematical formula graces and ornaments that should be only of the lightest and most evanescent effect. But alas! it does sometimes seem as if they must be devoid of the rhythmical sense. I have a horror of the reduction of music to absolute mathematics; it is too much like trying to measure one's emotions. Mathematics should not be allowed to assume the mastership. Only a few days since a pupil was at his lesson laboriously trying to regulate the exact number of notes in a trill at the termination of a phrase. "It is the manner in which my former teacher insisted on all trills being played." So much the worse for both teacher and pupil. Could anything conduce to more mechanical results? So train your fingers that you can easily manage the trill under any circumstance, either rapidly or slowly. In most cases it should sound like the free and spontaneous outburst of the trill of a bird. These short terminal trills should give the effect of

> "Short swallow-flights of song, that dip
> Their wings and skim away,"

not a clumsy effect measured out by arithmetical calculation. It is true that von Bülow has written out many of these trills, exactly so many notes to be gotten in, but this only goes to show into what stupid lapses bright minds occasionally can fall. Who ever tried to count the notes in one of Paderewski's or De Pachmann's bird-like trills? Given the ability to perform a trill swiftly and correctly the disposition of its notes in a given case will easily take care of itself. A player that needs to have his trills written out for him is still too incompetent to be playing Beethoven's later sonatas. The management of trills should be learned before approaching such works.

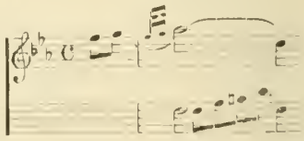
The spirit of what has been said applies equally well to other short ornaments. But in addition to this the question assumes another aspect, namely, what is their proper rhythmical position in the measure. It is in this connection that tradition has done its deadliest. Should the ornament take its time from the note that follows or the one that precedes? Tradition says, from the note that follows; but to this the musical sensibility answers no. Blindly following the letter of tradition is exasperating to the musical feelings. An example will make my meaning clear. In the Bülow-Lebert edition of Beethoven's Sonatas, what the composer has written in the fifth measure of the last movement of Op. 7, to be played as at A, has been arranged by the editor to be played as at B.

This mathematical adjustment causes the passage to lose all its grace and charm, transforming a light effect into a clumsy one, and outrages the rhythm by displacing the accent in such a way that it neither comes on the beat nor any rational subdivision of it. Judging by analogy in similar passages in the movement, Beethoven plainly meant that the accent should come on the principal note—E flat—and fairly and squarely on the first beat of the measure. According to the revision we have two primary accents on the first beat and one of them displaced by a fraction of a beat. The effect is that of a wooden-legged man trying to dance. There are times when a s ight delay in the accent proves very effective, but it is not in the production of such cross relations in accent. But the editors find it difficult to be consistent with their rules. In Op. 14 a precisely similar turn, which is written to be played as at A, is directed to be played as at B.

In other words, the editor recognizes that when there is no note in the left hand part by means of which to firmly establish the beat, it is inconvenient to displace the accent, and hence the different arrangement. He is right in the second case, except that it is unnecessary to write the turn out in large notes. The principle involved, however, is the same in the first illustration. A distorted rhythm remains a distorted rhythm whether it be accompanied by another part or not. A passage of grace notes in Op. 10 is rewritten, as at B.

This is worse yet. It is an act of vandalism, for an entirely new melodic and rhythmic effect is produced and completely at variance with that intended by Beethoven. And all done in the name of authority! Truly, as Shakespeare says, authority is a stubborn bear. Truly, if authority is to be guilty of such impertinent misrepresentations as this we would better rely on Bacon's dictum, that "all authority must be out of a man's self!"

In Op. 13 the editor's "rule" gets him into another dilemma. He finds that he will either have to break his rule, or, following it, cause Beethoven to break another one. He has not quite the nerve to do this, but I fear lest he mar his own reputation instead of Beethoven's, judging by the free and easy manner in which he distorts him in other places. He calls attention to the fact that if the passage



be played in accordance with rule, paralleled octaves will result between the treble and bass, and that, therefore, the grace must be "treated as an appendage to the foregoing notes."

But why from either measure? Anyone that has the ability to play these works ought to have the skill to let all such graces drop lightly and trippingly from the fingers without appreciably interfering with the rhythm of any of the principal notes. If the musical sensibility is taught to place the A flat where it belongs

—upon the accent—there will be little difficulty with these grace notes taking care of themselves and assuming their proper function of ornaments and not principal notes. When such notes are written out large the entire complexion of the composer's melody is changed.

I remember, a few years ago, when imbued with an undue reverence for the majesty of authority, and before I had learned that authority sometimes gets to be very unreasonable, I tried to teach pupils to play these graces in accordance with the rules of the mathematical pedagogues. But in no case did I succeed in doing anything but violence to the musical sensibilities of the pupils. The exhibition of the struggles to delay the accent for a fraction of a beat in the right hand after it had been firmly struck in the left were painful to witness and futile in results. But in no case did the pupil ever experience the slightest difficulty on being told to let such notes drop in lightly and gracefully and as if by a sort of delicate improvisation, leaving the principal note undisturbed in its position upon the accent. Such a doctrine will, doubtless, shock those who believe we should hold by tradition. But why should we cling so tenaciously to principles that were promulgated during a half-developed condition of the art and which do violence to the musical nature at the present time?

For a number of years I gave special attention to observing how these graces were performed by the great pianists. I ob erved that none of them performed them in accordance with the traditional teaching, but in harmony with the demands of the musical nature. Even Bülow himself, in all modern works, perhaps unconsciously or unintentionally, played them as I have indicated, that is in such a way that the accents of the principal notes came exactly together in each hand. The exceptions were rare, save in some of the works of the older composers of the age of Bach, especially when occurring in the inner parts. In many of these works the traditional rendering is altogether appropriate. Any why? In the answer to this we find the cause of the oversight, as curiously singular as it is illogical, that has led modern pedagogues to deceive themselves and nearly the whole musical world. On the early keyboard instruments no accent was possible, ornaments being added to the principal notes in the attempt to stimulate a prolongation of the sound. Hence, if a mordente took its time from the note following it, no violence was done the musical nature by a painfully misplaced accent. There was no accent to misplace, only a little tinkling sound. But the modern pianoforte has changed all this. That which has added most soul to the modern pianoforte is accent. And the musical nature is learning that there is a right and a wrong place for the musical accentuation, and to insist that the accents be placed in their proper places, in spite of the customs of a generation who played upon an instrument whose demands were radically different from those of to-day. It is a strange phenomenon, the pertinacity of useless tradition.

But the authorities, you will say! Well, authorities are a very good thing when they are right and a very bad thing when they are outgrown or wrong, and then Vanderbilt's famous aphorism will sometimes admit of a re-application. Besides, we ought not to be so lacking in understanding as to be unable to make new authorities for new conditions. MacDowell has sufficient genius to command respectful attention. In his edition of Couperin's "L'Ausonienne," he states, in a foot note, "It is recommended that the grace notes be played before the beat," putting the word before in large letters. It is plain to see that he places modern musical sensibility in advance of ancient authority. MacDowell's suggestion in regard to the acciacatura is equally pertinent. He places the following note at the beginning of his "Virtuosity Studies."

"Grace notes are to be played as written, viz":

and not

Now compare with this von Bülow's remarks, and emendations of similar notes, in the 28th and 29th measures of the last movement of Beethoven's Op. 90.

The passage in the original stands as at A. Von Bülow says that it should be played as at B and not as at C. As a matter of fact, both re-writings are incorrect. The disjointed accent at B is hideous, and the measured placidity at C is exasperating. The proper effect is precisely indicated at A. When correctly played the grace note has no appreciable time value. Its duration is so short that ordinary notation does not suffice for its representation and hence the grace note. It represents a charming rhythmical effect, which is completely ruined by either of the methods of performance indicated by von Bülow, an unwarrantable misrepresentation of the melody. Such derangements represent musty scholarship and not the spiritual freedom of true musicianship. In the deciding of such questions we should learn to listen more to the dictates of our own musical natures, instead of slavishly following the perfunctory rules of a past generation who had not learned the half that was to be learned about music. Music has developed considerably since their day, and musical instruments are practically entirely different things.

I had intended to say something about the so-called long appoggiatura, but my space is already filled. However, the long appoggiatura practically does not belong in the same category with the other graces. It may be asked what all this has to do with false noses. Simply this. To perform these acciacaturas, mordentes, and other graces after the rules of an ancient and pedantic tradition that should have died long ago along with other worn out customs, produces exactly the same distorted and grotesque effect upon music that a false nose does upon the human visage.

The linden, in the fervors of July,
Hums with a loud concert. When the wind
Sweeps the broad forest in its Summer prime,
As when some master-hand exulting sweeps
The keys of some great organ, ye give forth
The music of the woodland depths, a hymn
Of gladness and of thanks.

—*Bryant.*

THE BOYHOOD OF MENDELSSOHN.

FRANCES DENSMORE.

Through the streets of Berlin, more than eighty years ago, walked a well-known banker and his little son. The face of the man showed him to be a Jew. The child was remarkably handsome, the wind tossed his brown curls and brought a rosy color to his cheeks as he held his father's hand and trudged along sturdily in his big shoes. Had you inquired the names of this interesting pair, you would have been told that they were Abraham Mendelssohn and his son Felix, the musical prodigy. If you were a musician of some reputation passing through Berlin, you might call at their home, No. 7 Neue Promenade. Brother musicians were always made welcome, but if visitors became inquisitive, the little boy had a way of half-closing his eyes and jerking out his short answers with a little lisp. People sometimes disregarded the feelings of infant prodigies.

The history of the Mendelssohn family is doubtless familiar. Two generations before the banker there lived a Jewish schoolmaster, Mendel by name, who studied in poverty and hunger when it was a dangerous thing for a Jew to be educated. His son learned the German language and became known as Moses Mendels's son. This man was Felix's grandfather, and from these famous ancestors he inherited all the instincts of a scholar. His musical talent came to him from his mother, who played and sang with remarkable skill. She was a most accomplished woman in many ways; she spoke French, English and Italian fluently, was a devoted student of Greek poetry and a clever artist with the pencil. Her maiden name was Bartholdy, a compound of the Hebrew Bar and Tholdy and was assumed by the Mendelssohn family when they left the Jewish and entered the Christian Church. This took place when Felix was about sixteen years of age. Thus his mature years were associated with the Christian Church, but by birth and early education, he belonged to the race that has given the world so many sweet singers. His own music echoes the subtle charm of the shepherd king, and the harp with blue lilies twined about its chords was his by right of inheritance. David was only a boy when he was called before Saul, and the melodies that rose first to his lips were familiar home-melodies—you know the scene as Browning has pictured it for us. As the boy sang these simple airs there rose within him a prophecy of his future power, he was no longer the Pad of the sheep-fold—he was king though yet uncrowned, and in weaponless warfare King Saul was conquered.

Such is the lineage of Mendelssohn. The friendship of Felix and his sister Fannie is one of the most charming and ideal friendships in musical history. It began when they were children, it was an inspiration of their musical development and knit them together so closely that when the sister died, the note of joy passed forever from the brother's music. Others tried in vain to cheer and comfort him; but after a few months a "song without words" became his funeral march. Germany and the world of music mourned his death hit—beside the sister he loved, the singer slept.

While Felix was still a little boy, his piano teacher, Zelter, took him to spend a fortnight with Goethe at Weimar. Felix was already quite accustomed to taking his place among grown people. His tight little jacket was cut very low at the neck and the full trousers buttoned over the jacket. Into the slanting pockets of these trousers he loved to thrust his hands, rocking his curly head from side to side and shifting restlessly from one foot to the other. His letters give a child's insight into the home-life of Goethe. He writes: "After dinner Frau von Goethe's sister asked him for a kiss and I followed her example. Every morning I have a kiss from the author of 'Faust,' and every afternoon two kisses from father and friend Goethe! In the afternoon Goethe opens the piano and says, 'I have not heard you to-day, now make a little noise for me.'" In his second letter he says: "On Thursday morning the Grand Duke, the Duchess and the hereditary Grand Duke were here, and I played for them from eleven in the morning until ten in the evening with only two hours interruption. You cannot fancy how good and kind Goethe is to me. It does not strike me that his figure is imposing, but his look, his language, his name—they are imposing. The amount of sound in his voice is wonderful—he can shout like 10,000 warriors."

The little Felix must have needed some vacations such as these, for when he was at home, he and his sister began work every day, except Sunday, at five in the morning. Every Sunday a musicale was given for a company of invited friends, and as time passed the younger children took part in the programs. Paul played the 'cello and Rebecca sang, while Fannie presided at the piano and Felix conducted the little orchestra—perhaps it is in remembrance of these musicales that most of Mendelssohn's orchestral works contain a solo for the 'cello. Here Felix's compositions were given a critical and appreciative hearing, but he seems to have been quite unspoiled by praise. Sir Julius Benedict tells us that after working hard on his first piano quartet, he "cleared high hedges at a leap and climbed up the trees like a squirrel." His parents believed that youth was the time for study and growth rather than for display, and he played in public only once before he was fourteen years old.

During the year 1823, when he was fourteen, he wrote six symphonies for stringed instruments, five concertos, a piano quartet, a violin sonata, a Kyril for two choirs, a Magnificat, a choral setting of a Psalm, and an opera entitled "The two nephews or the uncle from Boston."

With his fifteenth birthday his boyhood came to an end. His opera was given at home, with full orchestra, and at the supper which followed, Felix's health was proposed and Zelter took him by the hand with the words, "From this day, dear boy, thou art no longer an apprentice but an independent member of the brotherhood of musicians. I proclaim thine independence in the names of Haydn, of Mozart and of old father Bach."

So the boy stood upon the threshold of his career. The disappointments which beset every artistic career awaited him, but the light, sunny disposition which characterized his boyhood never failed. The winsome child became the musician whom all the world loved.

Expert Opinions

Anent "A Critique and Some Comments Thereon."

The Practical Side of Music.

In the April MUSICIAN was printed an article by T. L. Rickaby opening a symposium on the average concert criticism. This was followed, in May and June by excellent articles. In this issue the symposium is continued in further contribution.

To the May number Mr. Rickaby, who seems especially able to launch interesting discussions, contributed an article on "Business or Profession, Which?" This subject receives attention under the caption of "The Practical Side of Music." These articles will be followed by others. We will he pleased to hear from our readers generally.—Editor of THE MUSICIAN.

ANENT "A CRITIQUE AND SOME COMMENTS THEREON."

Editor of THE MUSICIAN.

Dear Sir—While the criticisms of the editor were such as are sometimes given by individuals, I venture to say they did not embody the consensus of opinion of the audience.

To suit the taste of each individual in any audience would, of course, be impossible. The musician whose life is spent before the public, depends to a great extent upon the applause of that same public for his support. The critics may carp, but if his audiences are friendly and approve his work and his selections, he uses these selections again and again.

On this ground I disagree with Mr. Rickaby when he says, "There is really no excuse for a public exhibition of vocal gymnastics."

There is always the excuse that the public like to hear it and in many places demand it.

I am well acquainted with a singer of pleasing voice and artistic ability who has had some most peculiar experiences in pleasing audiences. In one town she sang ballads at the special request of the committee who engaged her, and through the success of this recital was engaged to sing in a town not ten miles distant. Here a request was made for "classical" music. The singer had learned her lesson and knew that "classical" meant "florid," but having a cabinet organ for accompaniment could not respond to the request, but sang instead the program which had been so successful in the former recital. The criticisms which came to her ears revealed the fact that she wasn't "much of a singer; couldn't hold a candle to Miss ——, who could trill like a bird." Miss ——'s trill was discovered to be not even an attempt at a trill, but she sang Arditi waltzes and Ganz's "Sing, Sweet Bird" with all trills omitted.

The truth is, the great majority of uneducated audiences (and these are not confined to the country) judge both singers and players more by skill of execution than by any other one thing.

I happen to know a little community of people who live so near a large city that they are counted city people, and in fact are city people. A friend of mine had repeatedly sung for them Rubinstein, Schumann, Schubert; but not until she sang an Italian aria did she receive anything but polite approval. The florid aria called out praise of the most extravagant order, although she was well aware that her singing of the song was fully equal to that of the aria. A prominent concert singer of Boston was paid $150.00 to sing at a concert in a country town. She was asked to send a classical program. Thinking the committee meant something less than classic, she sent one of her regular programs (which was, by the way, a most excellent one) and it was immediately returned with the request, "Please make it entirely classic." She returned a classic program, which was advertised far and wide and boasted over by all the town papers as the most classical program ever given in that part of the country. The concert was well patronized, but the singer received only lukewarm applause. A singer who had been engaged to sing ballads fared no better. The committee was greatly disappointed, and it was discovered that they wanted florid music, and the audience had expected it.

I cite these instances to show that the taste is similar in various parts of the country, and that neither ignorant nor intelligent critics can cultivate it by objecting to it. Neither can critics decide what concert performers shall sing or play. The public decides this.

As Mr. Rickaby says, the education of the public taste is a slow process, and must be undertaken by plans similar to those employed in all successful education. While the majority of the people in the world see more fun in the broad jokes of the minstrel show than in the finest *bon mot* of the delicate humorist, find melodrama more attractive than Shakespeare, they will still hear more music in "money musk" than in the greatest compositions of the masters.

When the schools begin to realize that music has its cultural side, and that it requires a good musical education to be an intelligent listener, some of the problems suggested in Mr. Rickaby's paper will be solved.

If three-fourths of the people who study music for the sake of learning to play or sing, would drop their ambition to be performers and study to be appreciative hearers of music, this one of the high arts might begin to take its proper place in the world.

It is the fault of the teachers, not of students, that music is not more generally studied in this way, and I for one should like to see the whole musical world convulsed over the question, "What can we do to make our pupils appreciative listeners?"

JULIA E. CRANE.

POTSDAM, N. Y.

MY DEAR MR. MANCHESTER:

I am in hearty sympathy with both parties represented in this article and my ideas are in full accord with the comments made.

Having for many years been engaged in similar work, I can speak from experience.

It appears to me that when we are seeking to educate and feel that we have been wronged by these notices, whether they are intended as complimentary or otherwise, we may gain very largely by asking ourselves some such questions as the following:

Is it my first desire to help those who attend these concerts to a better appreciation and understanding of music, or to ask them to accept the music of the program because it is good or classical and *we* enjoy it, consequently *they ought to?*

Do we seek to present musical truth in such a manner as to stimulate earnest thought, purify the emotions, and nourish the spiritual life?

It is a difficult matter to eliminate the *personal element* from such an undertaking, but until we have in considerable measure approached this high ideal of the educator, we are not prepared to do the work we have so generously undertaken.

We solicit the attendance of the musically uneducated and count ourselves fortunate if we secure a good sized audience, but what of the duty we owe them?

By a kindly criticism such as is here given, the disappointment and lack of real interest on the part of the listeners is manifested, and a plea made for music suited to their comprehension and needs. I believe that it is *possible* to select music that will interest and at the same time create an upward tendency in the scale of musical appreciation, more nearly approaching our own ideals.

When such music can be had in abundance, why not use it, and by a few well chosen words on the evening of performance, or through the columns of the newspaper, such suggestions and information be given as shall prepare them for their part in the evening's program—good listeners. Interest is enlisted and a better understanding arrived at between those who present and those who listen to musical truth.

We are so accustomed to set forth the virtues of the performer rather than the merits of the music that audiences listen with thoughts of artist rather than art.

THE PRACTICAL SIDE OF MUSIC.

MRS. EMMA A. THOMAS.

With the material and scientific progress of the last century came corresponding demands upon the field of education. The mechanical advancement that was far and away the conspicuous feature throughout the century, made it notable among all the ages of the world's history. Railroads, steamboats, telegraphs, telephones, electrical development, methods of manufacture, especially in the line of steel and iron, the postal system, these and their like brought about an astonishing revolution than which the world has never seen a greater. We do now in days what our forefathers took months to bring about; an hour at present is worth a week in the olden time so far as accomplishment goes. We are whisked about at magic speed; talk to our friends from one end of the continent to the other; send word in a few minutes to those at the very end of the world of the cheer there is with us. It was a century of "doing" in which business well nigh usurped the activities of man, even to the neglect of his completeness of character. As a result of this marvellous forward stride in mechanical things, the question of man's worth is apt to be answered in monetary terms, rather than in elements of mental or moral strength. And in educational circles it is but natural that the question of all questions propounded in regard to either subject or method, is the query as to whether or not it is practical. It is my purpose to say a word about the practical nature of music.

In the first instance, the place that music has held from the beginning of history, and the work that it has accomplished, especially during the past century, should have overwhelming weight in its favor. At no time in the history of the world and in no civilization has there been any more powerful influence than music. The fame of Orpheus, who moved the rocks at pleasure; the singing of the sirens, are but testimony by the Ancients to the wonderful power of music over the minds of men. And at no time of all times has the need of music ever been greater than at present. With all the materialistic tendencies of the last century, music has been one of the saving influences, one of the elements that have kept men from being demoralized by the stupendous development of one side of their natures, from being dwarfed and crushed and narrowed into mere machine-like creatures who work and eat and sleep and have no thought for anything other than these.

Is it not as important that the sense of hearing should be cultivated and developed as that the eye and the hand should be trained and educated? Yet music is the very fundamental science of beautiful sounds, by means of which the ear learns to properly discharge the functions for which it was intended, surely more than the mere recognition of words and noises, certainly as well, the appreciation of sounds that uplift the soul, that make the heart to be filled with gladness or with sympathetic sorrow, and the brain to teem with visions of beauty. The training of this sense must be done in youth. It is just as important that the child go through the elementary steps in musical training as that he learn to read and write and figure. For, after all, he learns to read, not to be able to go through the mechanical process of recognizing words and sentences, but that he may be capable by means of this mechanical process, of rounding out his character as nearly as possible to completeness, of reaching out to new ideas, to something better and higher than anything that has yet come into his experience. And if he does not learn to read in youth, it is so much the more difficult for him to learn at all. It is a psychological fact that scarcely a new process can be developed in the brain after the age of thirty. The proper time is in youth. And if the child learns nothing of music, it is ten to one that the vast world of beautiful sounds will be forever shut against him. Solomon said that of making books there is no end. He might well have included songs in the declaration, for it is just as impossible to exhaust the field of one as of the other. The child who knows nothing of music is ignorant of a world that is as broad and as

extensive as that of literature; he misses as much as the child who cannot read.

The man or the woman who loves music and who knows something of it has a cure for all ills. There is no sorrow, no feeling of depression or despondency that does not give way to some extent before beautiful music. If you know something of music, you are never alone nor do you ever know ennui, for the songs and the melodies that troop through your brain are companions that none can take away. And then there is that buoyancy and gladness of spirit that comes with these musical memories that is one of the most priceless possessions a human being can have. If you sing or hum at your work, can you not do it more easily, can you not do it more thoroughly and better than if you can think of nothing but the dreadful burden of the work? Surely these tendencies of music are as practical as anything can be. There is in this city a man whose profession is of a mechanical nature, but who is a skilled musical artist. Ask him which he would rather give up, his work or his music, and he will tell you that he could not give up his music, that it does as much for him in a money way as his professional work, for it makes his work that much easier than it would otherwise be, and besides that, it gives him more pleasure than anything else could give. There are thousands of people like him, who owe as much to music as to their regular trade or profession.

And now that music is so universally delightful and helpful to men, it is one of the most important elements in the industrial world. There are thousands who are called upon to devote their energies to teaching music. Music must be printed and so forms no small item in the proceeds of the printer, of the paper manufacturer and the maker of types. Musical instruments, with their woods and strings, and keys require, in the same was, the attention of the men who mine metal, the men who cut timber, the men who do the fashioning. Their selling requires the work of another class of individuals. No person who has a trained voice need ever be poverty stricken. And as a matter of fact the highest prices paid to almost any class of workers, are those of the great singer, whom people flock to hear, or the great violinist, or the great pianist. The wealth won by Mmes. Patti and Calve and the de Reszkes is a most clinching proof of the statement that music is the most practical thing in the world from a mercenary standpoint. True, we cannot all be Calves or de Reszkes, but there is no telling how many of us could earn a living by means of our musical knowledge. The child is taught to sing, comes to love to sing, develops a voice of marked beauty—there is a career of distinction before it. But, you say, why should not that child be taken out of the public school where he, or she, is attending, and put to work on his music alone? My friend, that would be the greatest mistake in the world. The purpose of all education is to develop character first of all, to round out a man. Give a man training in nothing but music in his youth and he will be just as ignorant as the man who knows nothing else but how to make shoe soles without the uppers. The greatest safeguard is to train the child as broadly as possible in the public schools, even if he does show musical talents, for there his musical study is not neglected. Then, when he has finished a fairly well-rounded educational course, he can take up his music in particular where he left off with it in the public schools, and the result of further study will be a man first, a musical artist next.

Every one ought especially to reverence himself, for every one is always in his own presence.—*Plutarch.*

A man who never makes mistakes, never makes anything else, either!—*H. C. Merriman.*

If the power to do hard work is not talent, it is the best possible substitute for it.—*James A. Garfield.*

Music is at once the product of feeling and knowledge, for it requires from its disciples, composers and performers alike not only talent and enthusiasm, but also that knowledge and perception which are the result of protracted study and reflection.—*Berlioz.*

Many build as cathedrals were built—the parts nearest the ground finished, but that part which soars toward Heaven, the turrets and spires, forever incomplete, said Henry Ward Beecher. Many musicians give years of their lives to preparing themselves to play and to teach, and neglect to build up the superstructure of a culture that carries into the higher planes of life.

VESPERTIME.

Now, dark first dims the meadow-marsh
The wind in gustful music sighs;
It spurns the reedy grasses harsh,
And, like tireless spirit, flies
Unseen, across the evening skies,
The solitary skies.

And wind-swayed, anchored fishing boats
Shine each a lantern, eerily,
Whose mirrored gleam, lo, dips and floats
Upon the wave, and seems to be
A fallen star, caught, in the sea,
A star dropped to the sea.

Mysterious breath—oh, life of night!
The dreamful gloaming's subtlest part,
From earth to heaven taking flight,
Coming from the twilight's heart,
Love-song to the stars thou art,
Oh, wind of night, thou art.

—*Town and Country Magazine.*

GETTING STARTED.

HARVEY WICKHAM.

Many lives are wasted because of hesitation to break away from an unfortunate environment and "get started" in a lucrative and pleasant field. We often have bad dreams in which it seems impossible to move hand or foot. Once hand or foot is stirred, the dream vanishes and we find that we were free all the while, except from the bonds of a diseased fancy. Yet there are real difficulties in the way of one attempting to teach without experience, and a few words concerning them may not be amiss.

Don't confuse your pupils with too many directions. A dozen bits of good advice are apt to produce confusion, if they have any effect at all, while one correction *insisted* on, marks a step in advance for the pupil. At first, teach only the broader facts about touch and expression. The larger divisions of a composition, if it be of a lyrical melodious character, are usually to be retarded. It is surprising how much one ritardando in a page will remove the machine-like effect which so many novices produce. Some play as if they were "wound up," and cannot ritard to save their lives. This is because their task is too heavy. They have no reserve power, the mind being all absorbed in the work of striking certain notes. Repeated phrases are usually played either softer or louder than the preceding. I mean, if a given phrase is identical with or very similar to the phrase that has gone immediately before, it is usually more effective if given with a different dynamic effect. I teach the "echo effect" first of all. It appeals to the beginner's ears and is usually his first introduction to the beauty of lights and shades. Crescendos and diminuendos are more difficult of execution and comprehension, and should be insisted upon only after the foregoing have been partially mastered.

Uniform fingering is the first technical point to be mentioned. A slovenly fingering habit is seldom overcome in later years. But the subject of fingering itself is too important to be exploited here. I would merely suggest that good fingering is usually much simpler than most of that found in print, and that the cardinal fact in the subject is that the same finger should always be placed upon the same key at every repetition. I think it is Amy Fay who says, "Play with the back of the hand if it is any easier." It is certainly good advice, whomever from. Young teachers are apt to be overawed by obsolete and arbitrary rules. So far as touch is concerned, the prime object is to get pupils to play legato passages with a hinge-like motion from the knuckle-joints, when but one note at a time is required of either hand. When chords are in evidence, legato is seldom so important as percussion. The keys of the piano should be struck with a light, quick blow, however soft the passage; and never pushed or squeezed down. Faulty legato comes from lifting the hand instead of the finger tips in scale passages, as a general thing, rather than from a misconception of the legato effect. When a student has learned the finger-legato touch, and to learn play chords and octaves with as much motion of the hand—aye, and *arm*, if it be but loose—and knows what character of passages require each, he has touch and technic enough to carry him a long way through the pleasant valleys of interpretation.

Don't use too difficult music. It is not easy to play the most simple composition well, nor difficult to murder the greatest classic. When a pupil understands that a tolerable amount of finish is looked for at his recitation, he will not complain that his work is not advanced enough. With a very young pupil who knows nothing of reading, it is well to get a volume of five-finger exercises, like Schmitt's "Elementary Exercises," and when some control of the fingers has been obtained and a fair acquaintance with the staff made, follow it with Loeschorn's "Studies for Beginners." It may be necessary to use two books of these. Pupils like sheet music, however, even if it is more expensive, and this is a point in which I like to humor them. It certainly robs a composition of something of its individuality to be bound up with a lot of others from which it is distinguished, perhaps, but by an opus and number. And volumes will be "looked through," no matter how much you protest. It would signify a superhuman lack of curiosity on the student's part if they were not, and a piece which has been "looked through" and "tried over" a certain number of times in the past, is a very poor subject for study in the present. There is also the danger of some older member of the family, or some semi-musical visitor obtaining possession of a book and "dashing off" its contents, to the amazement and discouragement of the child, if child it be. I am not aware that grown up novices like to have their work treated in this way. With sheet music, only the current lesson and old pieces are in danger, and every new composition comes as a pleasant surprise. Perhaps you think this a small item. It may be, but it is worth more than the trifling cost of paper and printer's ink.

The selection of first pieces and early pieces is very easy now, when every month brings excellent material from the press. It did not used to be so when I was a student. Then it was either Bach or "Tommy Dodd" with very little in between. Good teaching pieces must be cheerful and have a recognizable melody and "swing." Those resembling recitatives in any way are for experienced fingers. I have found some of L. E. Orth's Op. 15, which contains fifteen pieces, all happily named, useful. No. 3, "A la Valse," and No. 10, "Four-leaved Clovers," for example. J. B. Duvernoy's Op. 255, No. 3, "On the Sea," is an excellent little piece for many reasons. It has variety, is grateful to inexperienced fingers and is capable of many elementary expressional effects. Eduard Rohde's "Stray Leaves," so far as No. 8, "The Butterfly," is concerned, is on the other hand "ungrateful" to a certain degree, and perhaps more difficult than it seems. This is a more grave defect in a work either of extreme difficulty or of extreme simplicity than in those of the middle grades. I suppose Schumann's "Happy Farmer" has been the successful first piece of more people than anything I could name. It is so easy and sounds "so like a piece." Heinrich Stiel has an opus of ten numbers which he calls "Gay Pictures," and which contains some good material. I would mention the "German Dance," it being No. 8, I think.

"Crystal Fountain" is a very easy waltz by A. Blakestee, Op. 25, and can be used to produce a fluent style, devoid of pauses and brakes. C. H. H. Booth in Book I, of his Op. 15, has among its five numbers one which he names "Silver Dale Waltz," that is slightly more difficult than the above, but which otherwise answers much the same purpose. Waltzes are useful in giving the left hand familiarity with skips, and in inculcating a feeling for meter. "Marion Gavotte" (unless I err from the same Book and opus as "Silver Dale," and bearing the number 3), is all and more than has been said of the two foregoing, and deserves consideration. It can be made very pretty, and I have seen it played by a tiny pianist whose shoes came a full foot (I did not mean to pun), short of the pedals. If one does not object to simplifications (I do), J. W. Lerman's arrangement of Lange's "True Friendship," is a useful example of "ye sad style." Some exceptional pupils take kindly to this sort of content.

A collection termed "Germer's Instructive Edition of Select Piano Compositions," is made of selections from various and mostly well-known composers and sold in separate numbers. Its contents belong to a grade more advanced than most works I have referred to, but No. 16, "Birthday Greeting," by Paul Hiller, is quite easy and available. Some of the more advanced numbers are worthy of the young teacher's attention as compositions for his own edification. It is not well to stick too long to that pile of half-learned thumb-marked pages, from which one's musical education has in some mysterious way been drawn. Learn the best ones as you overtake them, technically and mentally (if your teachers were of the average kind in lack of good common-sense, this will be some time yet) and drop the rest. See what interpretations you can make for yourself from new leaves.

Young Composer's Column.

RULES.

1. MSS. marked "Young Composer's Column" must reach us by the 10th of the month to ensure notice in next issue.
2. Each MS. must bear the full name and address of the writer; the initials will be used unless a *nom de plume* is added.
3. Stamps must be enclosed if MS. is to be returned, but it is to be distinctly understood that the Publishers assume no responsibility for any MS.
4. No charge is made for the examination of any MS., and compositions of any nature may be submitted. The criticisms will be general and of such a nature as will be helpful to those honestly desiring frank and unbiased criticism.
5. No criticisms will be sent through the mail.

W. C. S. (417) A singable, effective song is "The sea hath its pearls." The harmony is correct and of a good deal of richness. The B♭ in r. h., measure 3 is not good; or, rather, the chord is not judiciously distributed. At the end of line 3 the accomp. should have G♯ in the upper voice following G♮; you are too fond of the second inversion of triads; see p. 2, last line, 1st measure. The last phrase in your song (last four measures) seems to us hardly strong or unusual enough to give full expression to the sentiment. We congratulate you on the song.

Rohilla—(418–419). We are interested in what you write about your music and wish you every success in your studies. For obvious reasons we cannot refer you to any teachers of harmony; we can, however, without any impropriety, refer you to the advertising column of THE MUSICIAN or to the nearest good teacher in your vicinity. Your piano piece and song are naive, cheerful little compositions; you ought to avoid consecutives like those in meas. 10–11 in "My Josephine." You evidently have talent; work at Harmony and Counterpoint and Musical Form with some good teacher persistently and you'll have a reward.

Florence.—(420). Your composition is one of those harmless pieces that are made up on tonic, dominant and subdominant harmonies; many such come to us and we always look at them as the earliest evidence of musical talent; as in your case they show a good natural feeling for melody, harmony and the four-bar rhythm, tho' we say this for encouragement, not self-satisfaction. We recognize in your piece much that is tuneful and promising. In preparing your MS. bear in mind the rule that notes sounded together must be on the same vertical line.

T. J. C.—(421). Your song is like many that we see, viz.: an imitation of some of the popular songs of the day; it has very little originality and is neither better nor worse than many others we have submitted to us for criticism. Your MS. is very clear and, despite its lack of character, the song would give pleasure to a vaudeville audience.

J. P. M.—(422–423). Your MS. is unusually neat; you should learn to distinguish between the rhythmical units of 3-4 and 6-8 time. You write many times a half note, followed by two eighths; this is incorrect in 6-8 time; the proper way is Several inelegancies of the same sort need your attention. It would puzzle a Richard Strauss to make out your melody in the second movement of the nocturne; you ought to revise this portion; stick to it until you work it out. In the Romanze the G♭ in meas. 4 ought to be F♯; in the same way in meas. 7 you write A♭ for G♯. Farther on you write E♭ for D♯. These are marks of illiteracy in music and prove that you ought to be studying harmony and the rudiments of music. Thank you for your kind words; work away and develop your talent.

Questions Answered.

[Under this heading THE MUSICIAN will be pleased to answer any questions submitted by its readers which may be of general interest. *All questions must be accompanied by the full name of the questioner.* Answers will be published without such names. Those who send questions should take care to state clearly what information is wanted. Only such questions as will be of interest to general readers will receive attention in this column. All others will be answered privately, for which purpose stamps should invariably be enclosed.—ED.]

J. E. B.—Old lessons should be *reviewed* by piano students, but it is not wise to weary the pupil with constant repetitions of a study when once acquired. Indeed, it is well, in many cases, where progress is not being made, to put the lesson aside for a short time to relieve the staleness of mind. It will be unconsciously mentally digested, and, if treated carefully, be easily mastered when its study is resumed.

J. R.—The name has been spelled in various ways, viz., Biethoven, Biethoffen, Bethoffen, Bethoven. This was caused by the uncertain authography of the period The composer wrote it Beethoven.

The "Damnation of Faust," by Hector Berlioz, requires a very large orchestra: perhaps the largest of any composition.

The development of the American Orchestra has been the growth of a generation, to whose success many persons, professional and amateur, have contributed. It would be difficult to state who had been most potent. The first of the orchestras to make tours, and thus introduce the higher works to the general public, was the one led by Theodore Thomas.

Eugene.—Wm. Sterndale Bennett was an English pianist and composer of note, born 1816. While strongly influenced by the music of Mendelssohn, he was not a pupil of that master, as is frequently supposed.

O. H.—We have given the pronunciation of many of these names in former issues. Believing they may be of general interest, we repeat them. Der *Rash*-kee; George *Hen* shell; *Crem*-o-nee-see; *Scot* tee; Sal-*lay*-zer; *Kryz*-ler; Oss ip Gab-bril-*o*-vitsh; Do-*nan*-yee; Bras-*sang*; *Gar*-day; *Hen*-selt; *Hy*-mon; *Koot*-lock; Less sher-*tits*-kee; Sgam-*bat* tee; Vee-en-ee *ows*-kee. There is a small pronouncing dictionary of names of prominent artists compiled by W. M. Breckenridge, which can be obtained through the publishers Breckenridge and Anderson, Chicago.

M. H. C.—The metronome mark ♩=92, shows there will be 92 strokes in a minute, and that each stroke will designate the length of a quarter note. If time-mark is 2-4, there will be two strokes of pendulum in each measure. In Grade III of National Graded Course, "Barcarolle," p. 31, the go in first measure, and C and E♮ in eleventh measure are certainly tied. In "Melodie," p. 10, Grade III, the last two notes in measure and first two in following measure are *tied.* We cannot understand what you mean by a *double stur.* Two notes of same name and pitch connected by a curved line *only*, are tied. For this reason it is plainly seen that the grace notes in "Chord and Pedal Study," p. 23 of same volume, are tied.

Lewis.—"The Beggar's Opera" was not an Opera in a strict sense, but a drama in which was introduced popular tunes and old melodies fitted with appropriate words. It was a satire; a hit at the prevailing fashions and at Italian opera craze. The author was John Gay. The tunes were arranged and scored by Dr. Pepusch. It was written in 1727 and produced in London in January of following year, and was extremely successful. It has been performed in United States within the last fifty years.

CONCERNING THE INTERPRETATION OF BACH.

FREDERIC S LAW.

The visitor to Chamouni is apt to feel disappointed when Mont Blanc is pointed out to him. What! that distant, insignificant looking peak the highest point in Europe? The eye is deceived by the apparent greater magnitude of the nearer mountains. But when he leaves the valley he is surprised to find that the farther he goes the higher the little sunny point rises in the air; its presuming companions meekly fall into true relationship with their superior and he realizes that perspective is necessary to discriminating vision.

What space is to the eye time is to the mind. Great men are seldom adjudged at their true value by their contemporaries. Only after they have finished their work do they fall into true proportion with those who surround them. Of no man is this more true than of Bach. It took a long journey—one to the century mile-post, before his grandeur impressed itself upon the world. During his lifetime he was harassed by the petty criticism and exactions of the town council under whom he held his position, and in the notice which they took of his death there was not even an expression of regret. They merely said, grudgingly: "Herr Bach was, no doubt, a great musician, but what we want is a schoolmaster, not a kapellmeister." Now, a century and a half after his death, July 28, 1750, Bach seems to be coming into his own. In the remarkable Bach festival in Bethlehem, Pa., May 23–25, which was noticed in last month's MUSICIAN, his three greatest choral works—the Christmas Oratorio, the Passion, according to St. Matthew, and the Mass in B minor, were given, under the direction of Mr. J. Fred. Wolle, to whose energy the festival was due. In many respects it is the most important musical step yet taken in America and gave rise to a number of questions concerning the interpretation of Bach's music to which it seemed advisable to give separate consideration. The superb singing and *aplomb* of the chorus was in strong contrast with the general lack of precision on the part of the soloists. Not that they were careless or did not do their best under the circumstances; but the fact is that in America, with the exception of a few close students, we have grown up ignorant of Bach's greatest music. We hear in the concert-room two or three of what von Bülow used to call "derangements" of his organ works for the piano—albeit, von Bülow himself was not without reproach in the matter of piano "derangements." The inventions, some of the suites, and the Well-Tempered Clavichord are familiar—at least, by sight—to many of us, but of his choral music, in which his genius speaks with the unmistakable and appealing force, we know practically nothing. The great St. Matthew Passion has, to be sure, been sung occasionally in several of our largest cities, but until its performance in Bethlehem, has never been heard under conditions so similar to those of its original performance on Good Friday, of 1729, in St. Thomas's Church, Leipzig. So far as technical excellence is concerned there is, in all probability, no comparison between the two. Bach's vocal and orchestral forces were weak in numbers and poor in quality. His choral works are so complex and difficult that it is evident he wrote for the ears of the inner sense rather than for those of the outer man, for it is all but certain that the performances of his music by the choir and orchestra of St. Thomas were worse than indifferent.

Our singers are out of touch with Bach, hence their uncertainty and lack of authority in singing his music. The difficulty is that not much can be gained from the examination of his works as he left them, since the marks indicating tempo and expression are few in number. The Bach style must be assimilated by a study of its traditions, a knowledge of musical history as to conditions prevailing at the time of his activity, an intimate acquaintance with the form and structure of his works and a conviction of their power and beauty, with the ability of imparting this conviction to others. In none of these essentials is Mr. Wolle wanting. His exhaustive study of Bach for almost a score of years, both here and in Germany, fairly entitles his readings to be considered authoritative.

His use of the *ritardando* at almost every perfect cadence, aroused not a little discussion. There is no doubt, however, that this is the traditional manner of performance. Though at first it sounds strange to modern ears, there are good reasons for it. In the music of to-day we are accustomed to slight fluctuations of tempo which interrupt, for the moment, the even flow of the measure. This irregularity of tempo, the so-called *tempo rubato*, which reaches its climax in Chopin, is the outcome of romanticism—the expression in music of the personal note, which has characterized all art of the century just at an end. Bach's music has but little of the personal; it is universal; cosmic, at times. In general, it expresses not the feelings of man, but of mankind. The *tempo rubato* is manifestly out of character with music of such a scope. Yet an unyielding, metronomic tempo which, with a total lack of gradation of tone power, some would have us believe characteristic of Bach, is equally out of place. After one has become accustomed to it the *ritardando* at the cadence seems to be a happy mean between the two extremes; it breaks up the stiffness without compromise of dignity. Then, too, it has a still higher function; it serves to indicate the structure of the work; it punctuates and gives accent to the architectural symmetry which is so characteristic of Bach. It would be an error to suppose that Mr. Wolle marked every cadence with an invariably broad *ritardando.* It was a study of the keenest interest to follow on the score his varying treatment of the *ritardandi.* The discriminating hearer soon discovered that they varied from the slightest *attarzando* to the broadest molto *ritardando.* He saw that the minor divisions of the movement received the minor *ritardandi*, the larger portions the broader *ritardandi*, and where the *ritardando* was manifestly contrary to the sentiment, it was altogether suppressed, *e. g.*, in several of the short, dramatic choruses of the Passion, such as "Surely thou art one of them for thy speech betrayeth thee," and "His blood be upon us and our children." Neither was the *ritardando* observed on the imperfect cadence. The law of inertia would seem to indicate that when, in a cadence, the body of tone is great, when harmonies are thickly crowded together, the *ritardando* can be broadened with fine effect. The same is true in the opposite case; when a *pianissimo* conclusion is reached and the music dies away from an apparent lack of vitality in the propelling power, *e. g.*, the wonderfully touching finale of the Crucifixion in the Mass.

Then, too, we must remember that in contrapuntal music the cadence has a power and a dignity of which, in our harmonic system of writing, it has no trace. At the time of Bach's birth, in 1685, the use of the unprepared seventh in the chord of the dominant, which gives that chord its unique power of authoritatively defining the key, was only coming into general vogue. It is not surprising that its comparatively rare appearance and powerful effect in crystallizing tonality should lead to the practice of lingering on the cadence of which it forms the principal factor. At that time the bloom was not worn off from the chord of the dominant and, even now, in listening to some of the majestic cadences which punctuate Bach's

counterpoint, one realizes the inherent power of this most commonplace of harmonic progressions.

Mr. Wolle accompanied the plain recitatives (*recitativo secco*) on the piano, which was in strict accordance with tradition. Though the effect at first was certainly jarring, it gave an archaic impression which, on the whole, was not unpleasing. Undoubtedly the organ would have been more grateful to the ear, but possibly practical, as well as traditional, considerations weighed in deciding its use. Mr. Wolle, by giving the accompanying chords, was able to keep undivided control over all his forces. More than one soloist had to thank him for a difficult interval dextrously given on the piano.

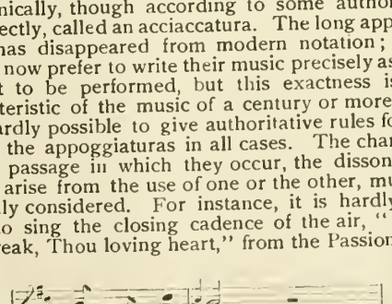
There is no denying that the soloist, no matter what his ability, finds the majority of Bach's airs stiff and ungrateful to sing. Apart from a few notable exceptions, they are instrumental in nature; the voice is only one of several parts and is no more considered in the contrapuntal scheme than an accompanying instrument. This is particularly embarrassing to the singer of to-day, whose whole musical education is based upon the supremacy of the voice part. Study of Bach traditions, a clear understanding of the structure of his works, will do much to overcome this embarrassment. But after all said and done, Bach's airs for solo voices are, in the main, academic in character. We may yet have singers with sufficient breadth of style and culture to infuse them with the human interest, which the airs of his great contemporary, Handel, generally possess, but it is certain that we do not have them at present. When, however, Bach shall have had the attention and study which have been lavished on Handel for a century and a half, we shall be able to judge better of possibilities in that direction.

Here comes into consideration the interesting question of tempo, which is the strongest factor in determining the general character of any musical work. The choice of a tempo is largely influenced by the temperament of the conductor. Hardly any two conductors agree precisely in the tempi of any one work. Within certain bounds such an accordance is not, in itself, desirable. One conductor, who regards detail, may choose a slightly slower movement than another, who aims at broader effects. The varying lights thus thrown upon a work by different leaders are a perennial source of interest to the student. Granted ability in a conductor, one need only demand that the conception be consistent throughout and justify itself by the effect produced. For instance, the tempo chosen by Mr. Wolle for the mighty double chorus in the Passion, "Have lightnings and thunders in clouds disappeared?"—seemed at first slow and heavy compared with that taken by other conductors, and which is apparently called for by the heading, *vivace*, one of the few indications of tempo given by Bach himself. However, this impression soon passed away; by the time the tremendous passage work of the basses on the word "thunders" was reached, it was evident that while a quicker tempo might have been more startling in the beginning, the movement adopted led to a climacteric effect of elemental grandeur which was all the more thrilling for the very moderation in movement. This is not saying that a different tempo under another conductor might not prove equally thrilling—only, the two effects would be different—just as the two men might differ in temperament and intellectual endowment. In deciding the question of tempo it must be remembered that in Bach's time—and this holds good up to the early part of the last century—the indications for tempo, both slow and fast, had a more moderate signification than at present; the slow movements were not so slow, nor the fast movements so fast. The *allegro* of the seventeenth century was like our *allegretto*, their *adagio* like our *andante*. Then, too, other considerations influence tempo—considerations of locale and forces employed—and in these the law of inertia also holds good. The larger the room and the greater the number of executants, the more moderate must the tempo be. A rate of movement which is perfectly satisfactory in a small, or moderately sized room, will often prove confused and lacking in clearness, if rigidly adhered to in a much larger space. Time must be given for the sound waves to reach the hearer with distinctness. Mozart's father, Leopold Mozart, makes particular mention of this in his violin school. He says: "In playing a solo one must consider the place where it is to be played. In a small room, a rapid trill will have the best effect; in a large hall, on the contrary, where there is an echo, or if the hearers are somewhat remote, a slower trill will be better."

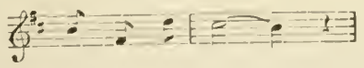
Bach wrote for the occasion; his works were often rehearsed and sung almost before the ink was dry on his manuscript, and since he directed them personally, he seldom took the trouble to give indications as to tempo or expression. These must now be decided by tradition and internal evidence. The tempo adopted by Mr. Wolle were consistent with the treatment which he gave them, but the tempos of some of the solos did not give the same logical impression. This was apparently because they were taken too rapidly. In singing the music of Bach, Handel and their contemporaries, singers are apt to apply modern principles of phrasing which have nothing in common with these composers. The long running passages with which they ornament their solos are conceived on instrumental lines. They had no intention of compelling the singer to sing these so called divisions in one breath. The sense of fitness was not then shocked, as it is with us, by the taking of breath in the middle of a word—it was, indeed, often necessary; *vide* the roulades on the word "plant," in Haydn's "With verdure clad," from the Creation. There were certain fixed rules for the taking of breath in such passages, *e. g.*, after a tied note, before a trill, or the highest note of a phrase, etc. Nowadays singers are apt to have an uneasy feeling at taking what seems such an unwarrantable liberty with the text. This leads them to hurry the tempo in order to bring as much of the passage as possible in one breath, and their dignity and security are imperilled. If they were to lay aside this anxiety as to sustaining the breath in long passages, and breathe when convenient, a broader tempo could be taken, which would add materially to impressiveness of effect.

The principal embellishments in Bach's music are the trill, and the long and short appoggiaturas. To modern ears the vocal trill has largely assumed a meretricious character, though in instrumental music its free use is by no means incompatible with the utmost dignity. In Bach's time the trill was as applicable to voices as to instruments, and was used as freely in sacred as in secular music; it is even found in chorus parts. Then a great deal of attention was given to cultivation of the trill; it was a daily study with the choir boys. The way in which the trill, if sung at all, was approached by the solo singers, showed that they had no very clear idea of its significance. Bach and his contemporaries did not conceive of the trill as a mere display of agility. With them it was a means of accentuation, and as such demands a clear, distinct and not too rapid execution. The close bird-like trill of the prima donna is absurdly out of place in their music. The turn is generally used in passing trills and omitted in trills which occur on the cadence. The cadence trill is commonly sung on a dotted note and stops on the dot in order not to obscure the rhythm.

There are two kinds of appoggiaturas; the long appoggiatura and the short (now called acciaccatura) appoggiatura. In Bach's time they seem to have been printed alike, and, with the curious inexactness of notation characteristic of those days, it was left to the singer or player to decide which should be used. They both appear as small notes, generally at the distance of a degree above or (less frequently) below the principal note. The long appoggiatura takes half the value of the principal note, which is made, therefore, just so much shorter; before a dotted note it takes two-thirds of its value, but this is by no means invariable; before a note tied to a shorter note it takes the full value of the first of the tied notes. All this is puzzling enough, without the confusion of a short appoggiatura of precisely the same form. This also takes its value from the principal tone, but is sung or played so quickly that there is little or no apparent loss of value in the longer note. Now it is distinguished by being printed as a small light note with a dash across the stem, and is technically, though according to some authorities, uncorrectly, called an acciaccatura. The long appoggiatura has disappeared from modern notation; composers now prefer to write their music precisely as they wish it to be performed, but this exactness is not characteristic of the music of a century or more ago. It is hardly possible to give authoritative rules for the use of the appoggiaturas in all cases. The character of the passage in which they occur, the dissonances which arise from the use of one or the other, must be carefully considered. For instance, it is hardly possible to sing the closing cadence of the air, "Bleed and break, Thou loving heart," from the Passion:



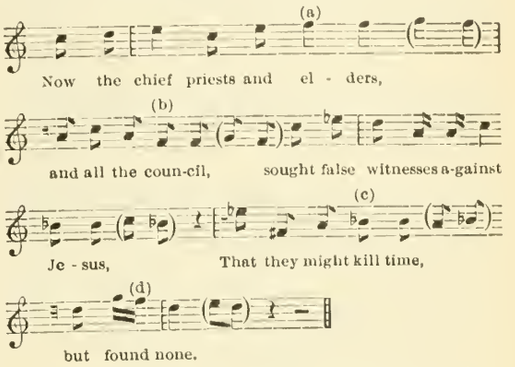
Other than:



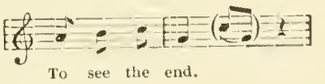
Ever since the two embellishments have been distinguished by difference in form, they have been so often misprinted, one for the other, that the confusion is, if anything, worse than when they were represented alike; printer's ink has wonderful power in giving authority to a faulty reading. The only safe guide is an internal sense of fitness gained by a close study of the works and characteristics of the master himself.

The term appoggiatura has also another meaning in the recitatives, and often in the airs, of the old school. When a phrase ends on two or more notes of the same pitch followed by a rest, the first of these notes is sung a degree higher, unless the interval preceding the reiterated notes is a fourth, when the first of them is sung a fourth higher. This raised note is called an appoggiatura, from the accent or stress it receives, being derived from the Italian verb, *appoggiare*, to lean. The well-known recitatives of the Messiah afford the most familiar examples of this use of the appoggiatura.

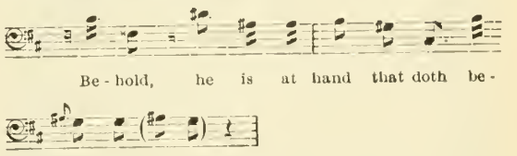
In Bach's recitatives the first of two equal notes of the same pitch occurring on an accent is generally sung with the appoggiatura whether the second be followed by a rest (*a*) or not (*b*), *e. g.*:



Sometimes, as at *c*, the appoggiatura is sung from below. The downward skip of a third also generally takes the appoggiatura, as at *d*. The following is an example of the appoggiatura with the fourth:

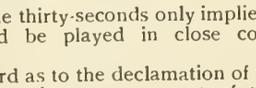


Another peculiarity must be noted: Sometimes the appoggiatura occurs as a small note before the principal note and is sung instead of it, *e. g.*:



The soloists varied in their use of the appoggiatura in the recitatives. Two or three used it consistently throughout, others did not, to the manifest detriment of the music. The fetish of singing the notes exactly as they are written was doubtless the cause of this discrepancy. A broader culture and a knowledge of musical history would serve to show what liberties with the printed text may be legitimately taken, and which, indeed, are absolutely necessary, if its true spirit is to be reproduced. How far the performance may depart from the actual notes is shown by the following passage for the violin in the duet, "Et in unum Dominum," from the Mass:

The thirty-second notes preceding the dotted sixteenths are not to be played as thirty-seconds, but as sixteenths slurred to the following sixteenths, which of course lose the dot, thus:



The use of the thirty-seconds only implies that the two notes should be played in close connection and slurred.

A final word as to the declamation of the recitatives which form so important a part of the Christmas Oratorio and the Passion. They should not be sung in too personal or dramatic fashion. This is allowable when a personal sentiment or experience is related, but for the most part they are simply narrative and should receive a sympathetic, but impersonal, treatment. For instance, in the recitative describing the denial of Peter, the words, "And he went out, and wept bitterly," were sung with all the grief and passion which Peter himself would have felt at his sin. This personal expression of sorrow, however, belongs to the deeply touching air which follows: "Have mercy upon me, O God," in which Peter himself bewails his weakness. We may pity a man who suffers remorse as the consequence of a crime, but we cannot feel the sting of conscience to the same extent; it is false art not to distinguish between the one who merely tells and the one who feels.

THE MUSICIAN.

A Monthly Publication.

EDITED BY
ARTHUR L. MANCHESTER, A. G. O.

PUBLISHED BY
HATCH MUSIC COMPANY.

SUBSCRIPTION PRICE.

SINGLE COPY . . . . . $ 15
PER YEAR 1 50

Free of Postage in the United States, Canada and Mexico.
Foreign Postage, per Year, 72 Cents.

Remittances should be made by Bank Draft or Check, Post Office Money Order, or Express Money Order. *Where none of these can be procured*, money can be sent in a Registered Letter.

New **Subscriptions** can commence at any time during the year.

Discontinuances.—The publishers should be notified when a subscriber wishes his paper stopped. In the absence of written notice to the contrary, subscriptions will be continued.

Communications are Solicited from all interested in the teaching and study of music, and in furthering the success of THE MUSICIAN. All articles or communications intended for publication should be clearly written on one side (only) of the sheet. Those which cannot be used will be returned.

All Letters should be addressed and **Remittances** made payable to

HATCH MUSIC COMPANY,

Eighth and Locust Streets, PHILADELPHIA, PA.

The Publishers of THE MUSICIAN do a General Music and Music Publishing Business. They can supply anything in Music.

AN ELEMENTARY TALK WITH PUPILS.

Many music students consider it a simple matter to take music lessons, yet very much depends upon the student. To take music lessons demands much from the student. There is an art in receiving instruction and comparatively few pupils know how.

Your teacher has given you something to study and practice. At the lesson time he hears you play or sing whatever he has given you ; takes in all your successes and failures in the learning of it in detail, and learns by your playing and singing, what your plan of study and your way of thinking have been. In short, he reads *you* by your work and then aided by his knowledge and experience, proceeds to give you hints, directions and instruction suited to your especial case, whether it be technical, interpretative or both. It is at this point that your ability to take lessons is tested. Your teacher by his experience and study focalises on you and your needs, at this time, all his knowledge and power. He sees at once your weaknesses and deficiencies ; knows where you are defective in thought and working power ; comprehends your lack of ability to appropriate opportunities for gain ; and proceeds to give suggestions for the strengthening of these weaknesses, the overcoming of defects and the snatching of benefit and gain from passing opportunities.

●

It is a very important duty for the student to notice and remember all mistakes and their corrections. "It is the mistakes that educate." When you have fallen once you should not fall again from the same cause. A mistake once made and corrected should not be made again. After the lesson is over you should have a clear idea of what has been said and done. So clear, in fact, that when you sit down for your next practice, every incident of the lesson time and its instruction, with all mistakes made, should form a distinct picture in the mind. Should the teacher play or sing a passage or piece for you, watch closely and remember the peculiarities of his rendition and wherein it differed from your playing and singing, and above all, understand and remember *why* he played or sang for you. A great deal of benefit that might be derived from the lesson time is lost because of a lack of observation on the part of the pupil. Very often the motion of a finger as the teacher illustrates some difficulty will give a clue to the proper handling of the passage, yet this is seldom seized by the student because of his inability to see and perceive. Lesson giving is really hint giving and it is because of the slowness of the student to seize these hints that very often slow progress is made. In fact, lack of observation both in lesson taking and lesson preparing, is the great fault of music students generally.

●

The experienced teacher studies his pupil's disposition, make-up and tendencies, and little acts reveal the personality of the students. You are judged by little words, little deeds, little motions made when off your guard. The lesson to be learned from this is to be true yourself in your lesson time, to go to your lesson with a sense of responsibility resting upon you, and with every faculty alert and ready to be impressed. Then retain these impressions to be worked out in the study time. It is of vital importance that you learn how to take your lessons so as to derive the greatest possible benefit from them.

●

Your lesson should be taken with every sense alert, and without missing any hint or suggestion. It is then your duty to put in practice the hints, suggestions and new ideas received during lesson time. Now let me ask you a question. What is your idea of practice? How have you approached your practice hour, and how apportioned its work? Have you had *any clear* idea, any well-formulated plan in mind? From the instructions received at lesson time it will be necessary to evolve a systematic order of work. It is probable that your lesson developed several classes of mistakes, technical and otherwise. And it is essential that you separate these errors, their causes and their cures, so as to practice each in the particular way which alone will overcome it. This done, and having found out just what your practice is to do for you, you are ready to begin.

●

It is impossible to lay down set rules which will govern all pupils alike. One pupil needs especial technical development, while another has been blessed by nature with a peculiar aptitude for mechanical facility. These two students will need to use their practice time differently. But while it is impossible to lay down set rules, there are certain principles underlying all work of the kind which you must keep in mind if you expect to be benefitted by your study.

●

Properly divide your practice ; give a certain amount of time to each part of your lesson. Technics, the last piece, review work and sight reading should each receive proper consideration and time. Give the most time to the most important part of your study. Subdivide each study. There are in each piece or etude, some parts which will need especial effort to conquer. These should be sought out and the cause of their difficulty found and removed. This can only be done by extra study and practice. Alternate the different parts of the lesson. The change is restful and better results can be obtained by judicious alternation in the study of difficulties, than by wearying yourself with over application to one subject.

●

When you know what you are to do in your practice and how to do it, go slowly. One of the greatest hindrances to good work is hurry and lack of carefulness. No fault can be overcome without thoughtful, careful and *slow* study. "Make haste slowly" is a suggestive proverb. Be regular in your work. Do not omit a certain study one day thinking to make it up the next by doubling the time. Each part of your practice should be done at its regular time each day without intermission. You should learn to invent little studies from the various difficulties met in your pieces. There are many teachers who do not give many etudes ; but invent technical exercises instead, taking the foundation for them from the difficult places in pieces used. Each student as a rule could by thoughtful study arrange such exercises for himself and derive a double benefit from the analysis of the difficulties which it would involve.

●

A great fault is mechanical practicing It is customary with a large class of students to sit down to the work of practicing with the mind wandering, and listlessly go through the movements of practice with but the slightest mental impression. As the mind must perfectly control all motions and direct all the minutiæ of the work, it is absolutely necessary that the impression made upon it be clear and forcible. This only comes from close concentration. Even the acquiring of correct habits of fingering demands close attention, and in the matter of gaining the needful technical control of the piano playing muscles, complete mind concentration on each muscle action until such action has become automatic, is the only process by which success is assured.

●

There is another essential faculty which is only to be acquired through concentration. The power of listening to your own performance and criticizing it intelligently must be had, if you wish to do your best as a music student. It is closely allied to observation and the two go hand in hand.

●

The use of spare moments is another matter for serious consideration. Much may be done in the minutes that pass by unheeded. There are difficulties that trouble us for days, it may be for weeks, which ten minutes of earnest, well placed labor would put out of the way forever. We often hear it jestingly said : "I must add another day to my week." Let me tell how you can really do this. Four minutes saved each day from usually wasted time will add an extra day to your year or an entire month in thirty years. Twenty-eight minutes saved each day will give you an extra week each year and seven months in thirty years. This is real addition. Think of it and be wise.

●

Patience and perseverance are trite words, but they contain the magic secret of success. Are you patient? Are you persevering? Will you meet disappointment with a cheerful face, a brave spirit and a determined will? Are you willing to strive earnestly and long if need be to attain unto your ideal? Or will you be daunted by the delays that will come? Will you weakly yield to your first, second, yea even to repeated disappointments? Let it not be so, but set your faces as flint and be not turned away from your purpose and success is sure.

●

You may say you are not studying music professionally. Even so. Still what is worth doing at all is worth doing well. If you begin, stick to it until you can be called victor, or at least, retreat with honor after a brave struggle. Do your duty. It will not do to shirk it or postpone it. Do your duty and do it at once. There are unpleasant things in your music study. Do them because you are conscientious in doing your duty and they will resolve themselves into pleasure and bring you the wished-for success.

●

With the midsummer heat comes a disposition to relax, to lessen activity. July and August, however, are the months of summer schools. These afford the only opportunity many teachers have of study under the direction of capable instruction. While it is commendable for such study to be done, it is equally wise for those who do it to take care of their physical condition. Do not *overwork*. Unite with your study recreation that will renew your stock of vitality, and take pains to go back to your work with freshened minds and bodies as well as with an increased store of knowledge. The tension must be relaxed if your best work is to be done. Be prudent as well as earnest.

GOING TO EUROPE FOR INSPIRATION.

STELLA C. BISHOP.

America is in the lead of all the world in many respects, but we look to the Latin races for the highest and best in music and the arts. We spend hundreds of thousands of dollars every year, and each student who is able to do it remains abroad several years "to finish his education." We have a fixed belief that it is impossible to become a great musician or a great artist unless we can spend a few years in the best schools of Europe. Why do we place so much importance upon the European schools when we have such splendid schools at home? Can we not become musicians, artists, sculptors without depending upon Europe? We have instruments that are the very highest products of mechanical skill, we have teachers and schools, and art galleries that rank with the first. Then why do our students go to Europe?

I will tell you why. It is to catch *the inspiration* of the "old masters!" Ah, there is the point! Music is cold and expressionless unless it has soul, unless it is spiritualized by inspiration. Music may be mathematically and mechanically correct in every measure and in every tone, but unless the performer can make it an expression of his own individuality, it is dead and cannot inspire to better deeds, but instead it chills and disappoints. Every musician knows that his success depends upon his power to put soul into his productions.

I do not wish it to be understood that I do not appreciate either the excellent European schools or the musical advantages to be gained through private instruction from eminent teachers abroad, for I do appreciate them; the inspiration gained through study of the classics, and familiarity with the works of the world's greatest composers, is as truly not to be questioned; but I firmly believe that *the highest and best* is not to be found wholely in looking backward, and that to attain to lofty heights in music and art, we must cut loose in a manner from the old idolatory of the dead past.

They who go to Europe for inspiration seek in vain, and come home disappointed, much poorer in purse, though perhaps richer in experience and technical drill, but still lacking the "inspiration." They have spent a small fortune and several years to be "educated in Europe," and have gained thereby what? Lessons with a famous teacher and the lustre lent by the association, experience of a certain order more or less questionable, generally a one-sidedness of development, due to hasty endeavor to accomplish the impossible in a given time—all this, but with the aim, which in every case should have been paramount as far as ever from having been realized.

Scores of pupils, I will not say musicians, for the latter term implies a more ripened stage and proved attainment, scores of pupils return at the end of the few months, more or less, which they had elected to spend in "finishing lessons," having actually been more harmed than helped, and finding to their own chagrin and that of their friends, that the plan was a sad mistake. The result is a loss of self-confidence, and often a weakening of the entire character and individuality from which the majority never rally.

European teachers are the last to enlighten the newcomer to their studios as to the futility of his purpose and desire. Even should he be told in so many words that the attainment of both knowledge and inspiration is a matter of growth and development from within, and not of precipitous seeking from without, still he is there, intent on the swift endeavor; the journey lies behind him. He is not advised, nor possibly would he listen either to such advice, that his wisest course would be to return at once to America, unless the possession of ample means justifies a certain line of work which shall lead him in time nearer the goal, a course comprehending a revolution of his former plans and theories. Instead of the Leschetizky, or Moszkowski whom he had in mind, a good teacher for one-half, or one-third of the price must be sought for the present, at least. The more famous teachers, if requested to do so, would recommend such an one, and thus is saved to the novice abroad a first and important item: Money.

Secondly will come the saving of time and strength, and this may be effected in divers ways. It has been said of the American student by foreign musical critics, that next to the prevalent folly of choosing a teacher for whom he is not prepared, stands his fault of not knowing how to work systematically. It is a common error for a pupil to practice six, seven, even eight and ten hours a day, and for the most of this time entirely mechanically, little realizing that practice in this manner is worse than wasted. It is right here that time, strength, and as a natural sequence, money, can be saved by *the habit of concentrated thought*, and it is a habit which, if lacking, must be acquired, cultivated, and daily established and practiced by pupils, whether studying at home or abroad, if there would be any gain in the right direction. Mechanical practice is of no avail, results often in positive harm, and the long hours of useless labor may be reduced to two and three, filled with intelligent, wisely-directed mental endeavor, the mind controlling the muscles employed, the outcome steadily recognized progress.

It is thus that technical equipment may be gained, and the way prepared for entering the class of a noted instructor, but even taking the short cut, the path of concentration, this might have been as well and as satisfactorily accomplished at home, technical drill being but a means to an end, since it is conceded that technic must precede revelation and afterward accompany it as an inseparable handmaid. As concentration more speedily makes the successful technician, it is of still greater necessity to the would be artist. Inspiration must be wooed, evolved, patiently, persistently with the full realization that it lies in latency within, awaiting the word of faith and recognition, which shall awaken and call it into gradual and daily increasing manifestation, through the touch, the tone, the interpretation, and sooner or later through the unfolding creative faculty. Apollo, no longer a myth, sleeps in actuality in the human soul. We must look within for the power to inspire us, and the source from which our greatness must come is from the power of concentrated thought.

Our own schools are lacking in inspiration because they, too, look to the "old masters," and dream only of restoring the "lost arts." There are no "lost arts," for nothing is lost or ever will be, and to look back to the dead past, to tie our faith to it in any way is not the way to advance. Genius is the inherent property of every soul and all expression is the product of its awakening. By this power of genius within we all express all of life, health, happiness, prosperity, music, art, literature, oratory, poetry, invention, in short, everything that we do express is the offspring of our own genius to the utmost extent of its awakened power.

The process of the awakening, need not of necessity, be a tedious one, and all aids may be employed wisely and understandingly. *The Keynote, concentration*, technical preparation, the study of Nature and the works of the masters; yet all as but means to an end. The hurry and bustle of life in America may be exchanged, if one be well on in the artists' highway, for the greater serenity and calm, and the atmosphere of art, to be found only abroad, yet even this of itself is not a necessity, and may be made merely to serve, with like outer aids, *the awakening of the inner powers.*

HUMENSCHLACHT FOR GRAND ORCHESTRA.

Symphonische Dichtung by F. Liszt—An Analysis.

PROF WILMAR ROB. SCHMIDT.

The idea of setting to music the human battle first occured to Beethoven, when he saw the famous painting of Kaulbach, having that memorable event for its subject.

He at once prepared, in a rudimentary form, the motives for a new symphony which, if completed, would have been his tenth. But, at his death, the manuscript was found unfinished.

Liszt took up Beethoven's idea as developed in one of those motives and presented it according to his own view of the matter, thereby reproducing thro' music a great historical event, and thereby giving another grand composition, in form of a symphonic poem, to the world.

It required genius to convey, thro' musical sounds, the noble thoughts suggested by a masterpiece of painting. It was given to Liszt to carry such a delicate undertaking to a successful end. He was one of those few great masters who were strictly and thoroughly original in their ideas as well as in their productions. Thus, his creation of the symphonic poems furnished him with a wide and fertile field for his vivid imagination.

Liszt's musical poems are not of the dry and formal style of the old classical symphonies. They are distinct portrayals of individuals whom we see living and moving in his twelve great symphonic poems. Every motive is a living personality, an active, throbbing, passionate being, described with great dramatic skill and effect.

The common conditions and surroundings of human life are portrayed with a depth of feeling that delights us with its exquisite naturalness and seem to be a sweet and fragrant breath from the realms of dreamland. His poems, therefore, are suited to him only who, endowed with a noble soul, can rightly interpret the wonderful creations of that great mind.

The Huns believed, with the old Germans, that each hero who fell on the battlefield secured, in this way, a sure and safe passport into the land beyond. He was carried, as they believed, by the angels (Walküren) to heaven (Wallhalla), where he was to enjoy endless pleasures.

Liszt, in his first measures, reviews the nation in all its barbaric. The air seems to be filled with the spirits of the blood-thirty Huns, whose presence

causes fear and dismay. The signal is given for the battle, and as it rings thro' the wild air the spirits are

ready to be led on. Then, as the signal is given, the defiant spirits take their flight. The Huns, as a warlike people, always carried death and destruction wherever they went, so the measures aremost faithful indicative of scenes of death, plunder and cruelties.

As the music proceeds the screams and tumult of battle increase, the very sky is blood-red.

Warriors fall with a smile on their pale faces in blissful expectation of the fulfilment of the promises concerning future enjoyment. In the throes of agony they are intoxicated with the pride of victory and their joy is greater in death than in life.

The singing of angelic choirs resounds thro' the spacious halls:

Crux fidelis inter omnes
Arbor una nobilis:
Nulla silva talem profert
Fronde, flore germine:
Dulce lignum, dulce clavos
Dulce pondus sustinet.

A heavenly light spreads its celestial glory everywhere and an everlasting radiance lights their way. They pass from darkness to light, from death to life everlasting.

A musical composition, if good, gives more pleasure, though poorly performed, than does the best performance of a poor composition,—*Schopenhauer.*

THE NEW EDUCATION.

FOREWORD.

The *New Education* offers its readers, for 1900-1901, the best plan for a year's study that it has yet presented. It will be the best in two particulars: In choice of subject matter and in manner of presentation. The hearty reception which this novel educational feature has met with makes it possible for THE MUSICIAN to continue to develop the idea of home music study and to offer the best advantages that are to be attained in this manner.

The series of subjects for the coming year follows. Each subject is in the hands of a specialist and will be treated practically and as fully as possible in twelve lessons. In order to meet the immediate demands of students who seek information on special points in the work, the editors will be glad to furnish

Suggestions for the further study of any subject.
A bibliography of any subject.
Information on any question in the lessons.
The consideration, and, if necessary, the presentation, or general discussion of any point that comes up in actual teaching.

The subjects for the coming year are as follows:

I. Advanced History of Music; twelve lessons, with suggested reading.
II. Psychology and Pedagogy of Music; six lessons in each subject; suggested reading.
III. Advanced Music Form; twelve lessons developing those already given in this department.
IV. Harmony and Melody; twelve lessons; six in each topic.
V. The Literature of Aesthetics and Criticism in Music, twelve lessons.
VI. The History and Development of the Piano, twelve lessons with illustrations.

The following conditions *must be observed:*

1. Address all communications for the *New Education* department, thus: THE MUSICIAN, New Education Department, 8th and Locust Streets, Philadelphia, Pa.
2. *Do* NOT *roll your manuscript.*
3. The answers for each month must be sent as soon after the issue of the journal containing the subject to which they relate as possible, and before the next succeeding issue. No papers are to be held until end of course. New members can join at any time by sending names and answering questions contained in current issue.
4. The editors are obliged to say that no papers will be read or rated that fail to comply with conditions 3, 4, 5 and 6.
5. No two subjects should be written on one sheet. All sheets pertaining to one subject—for example, History—should be independently fastened.

Ratings will be largely influenced by the following points:

Accuracy.
Clear, concise, yet smooth diction.
Grasp of the subject.
Originality of thought and statement.

The questions following each lesson have two purposes: First, to connect the reader's mind directly with the text—the most fundamental, that is, the lowest duty a question can serve, but necessary. Second, to suggest a thought beyond the mere expression of the words in the text; the highest purpose a question can serve. The first is by far the least useful if he has a memory; the second the most useful if he has a reasoning faculty.

The editors will welcome letters from teachers which contain:

a. Suggestions as to what will make this department more valuable, the suggestion being dictated by the teacher's individual experience.
b. Statements regarding the application of this work with pupils as well as in one's own effort to secure a broader education.
c. If there is any line of thought of practical value to you, and likely to be equally practical to others, let us know it.
d. All such suggestions must be sent to the office of THE MUSICIAN, addressed according to direction given in regulations.

[NOTE.—*New Education* students are specially requested to avoid enclosing *anything* relating to their business with the Hatch Music Company with their *New Education* papers. The failure to comply with this rule causes great trouble. Kindly keep this matter in mind. We wish to call the attention of our students to the necessity of *fully prepaying postage on their papers.* We have been compelled to pay additional postage on a large number of those already received. This should not be, hence we request our students to take care that sufficient amount of stamps be affixed before mailing.]

VIII—INFLUENCE OF THE RENAISSANCE: I, GENERAL EFFECTS.

PERCY GOETSCHIUS, MUS. DOC.

The momentous historic events recounted in the preceding two chapters took place shortly after the great awakening, throughout middle and southern Europe, of interest in the arts and sciences of ancient times. This, known in history as the Revival of Letters, or (in architecture) the Renaissance, was a widespread and exceedingly lively intellectual agitation, mainly precipitated by the overthrow of the Byzantine empire, about the middle of the fifteenth century. Through the fall of Constantinople the long-hidden treasures of Greek art, science, poetry and philosophy were thrown open to eager students from the West; barriers that had long separated Europe from the profound scientific culture of the East were broken down, and an animated interchange of energy succeeded the apathy and bigotry of the middle ages. Artists and scholars were aroused to broader views and higher aims; and the light which forthwith dawned upon the civilized world heralded the birth of a new and glorious era, conceived of the spirit of liberty, and maturing, through many and bitter and sanguinary struggles, into the enlightened freedom of modern days.

Some epoch-making events of concurrent music history, already touched upon, were no doubt influenced more or less indirectly by the revival of learning, though they cannot justly be associated with that event, save in a very general sense. Nor is it easy to point to any single *significant* musical acquisition during the first 150 years of the renaissance agitation (up to the threshold of the seventeenth century) that is obviously and directly due to the latter. At the same time, it is entirely manifest that a silent general influence was being constantly exerted, quite as well upon this as upon the other arts, and preparing for future disclosures as brilliant as the release of the butterfly from its chrysalis. Of a few of these general effects, as preparatory to more momentous consequences, it is necessary to speak in this chapter.

In the first place, no epoch in history had ever been so prolific in *Theorelical* writers and books on music science as the first century of the renaissance. This period embraces the names of *Tinctoris* (born in Brabant about 1435), *Gafurius* (Italy, 1451), *Glareanus* (Switzerland, 1488), *Zarlino* (Italy, 1517), *Salinas* (Spain, 1512), *Adam da Fulda* (Germany, end of the fifteenth century), and very many more, all of whom contributed powerfully to the rational practice of musical technique and constitute, in reality, the first eminent group of music theorists in modern history.

One of the earliest indications of a determined effort to return to the music theory of the Greeks is recorded in a most remarkable old book of Glareanus (so named from his birthplace, Glarus, in Switzerland), printed in 1547. Remnants of Greek theory had, as already stated, been carried over into the early Christian Church and formed, in fact, the basis of the musical systems of St. Ambrose and Gregory. These, however, proved to be of but little practical use to the tone masters of the great schools of mediæval counterpoint, for (fortunately for them and us) they had an instinct for the *natural* scale sufficient to base their calculations upon, and it served them vastly better than any of the vague, abstruse and radically unnatural dispositions of ancient Greek theory could ever have done. But, for all that, there prevailed a persistent uncertainty in regard to that which we now call key and mode, especially among the scholastic writers (the *popular* musicians seeming to have grasped and used the distinction of major and minor long before their learned brethren stooped to the simple truth); and the old "Greek modes" were therefore employed for want of a surer guide.

Glareanus appears to have ransacked Greek theory and to have proposed a new system of modal harmony, based upon what he there discovered. Of his 12 modes, six became the adopted "ecclesiastic modes" of succeeding generations (bearing original Greek names—curiously enough, in reversed order), still encountered in some German chorales and, in isolated instances, even in works of our own day. Their supremacy was, however, limited; for after the recognition of the major and minor modes in the next century, musical composition struck out in a new direction and soon distanced the fettered music of the old "modes."

Another item of old Greek theory was the distinction between the diatonic, chromatic and enharmonic species of melodic progression, brought again to light by the ardent researches of enthusiastic scholars and suddenly applied, with more or less daring, in practical composition. Among the very numerous learned writers of the sixteenth century there is one—*Cyprian de Rore*—who is famous for his experiments in chromatic succession. His was possibly not the very first attempt to introduce the element of chromatics into music, but it is certain that this startling and significant innovation (without which the freedom and passion of the dramatic and romantic styles could never have been realized) dates from that century and is most closely identified with the madrigals and other works of De Rore. Once tried, "chromatics" never lost its hold upon musical practice and, though much condemned and treated even by the most progressive writers with caution and moderation, it steadily grew in favor and importance until it asserted its rightful place by the side of "diatonics." Its extraordinary power is exemplified in our generation in the great music-dramas of Richard Wagner, of which, were the "chromatics" to be eliminated, nearly nothing would remain.

The enharmonic progression was also essayed, but not with success until much later.

But these were, after all, no more than general indications of the silent inner growth of the music art, stimulated by the many and powerful agencies of culture which the revival of letters had called into almost universal activity. The culmination of these influences was to be seen, in the fullness of time, in a notable division of all musical practice into three mighty branches—the Oratorio (in which sacred music survived), the Opera (the triumph of all secular tendencies) and Instrumental music (the true and proper vehicle of tone expression) Each and all owe their inception and early development to the peculiar condition of art, science and literature created by the Renaissance; but none so directly and strikingly as the Opera.

QUESTIONS.

1. What was the revival of letters, and to what due?
2. What was its influence upon music at first?
3. What general consequences can be traced to it?
4. What did Glareanus undertake, and what did he establish?
5. What is attributed to Cyprian de Rore?
6. What modern master exemplifies the power of "chromatics?"
7. Of what were these movements an indication?
8. What distinct division of musical practice took place at this time?
9. What does each branch typify?

FORM—EIGHTH LESSON.

Constructive Form.

THOMAS TAPPER.

Melodies with and without skips formed the basis of the Seventh Lesson. They dealt with the Phrase; and this short form may be Small (four measures) or Large (eight measures). These are generally termed regular Phrase lengths; and there are, besides, Phrases of Irregular lengths. These are so-called because they depart from the satisfactory metric regularity of the Regular Phrases. While not as common as the Regular Phrases, they may be found easily in the works of the best composers.

The student will recall that this matter of the Phrase was discussed in the First Series of these Form Lessons (1899-1900). Then we were examining and classifying structures; now we are interested in making the structures. In no other way do we actually enter into the spirit of the music.

It becomes necessary for the student who is anxious to perfect himself in the habit of writing his music—thoughts constantly to keep it in mind that it is, after all, a habit; that *doing* it, under guidance, perfects the habit; and that nothing of any permanent value will result unless the music writing spring from, be referred to, and be judged *by the voice.* This fact is so apparent that teachers of theory who are no longer

young men have come to recognize the truth of it. Hence, the advice one must give to the young composer is not merely to write, but to sing everything he writes. And, really, it is surprising how one may sing one's way through music that is not intended for the voice. By so reading it one not only learns how it sounds, *but one discovers every melodic tone line in a composition.* And here it may be stated that the first essentially valuable habit a young piano student should gain is that of singing his lesson from beginning to end, Left hand part and all. However common the accompaniment may seem, it may be sung and a melody line may be established—none the less important even though it prove to be nearly a straight line.

The student must recognize in this emphasis of the singing habit a practice worthy of his continued observance which, if pursued for all it is worth, will permit him to read with pleasure, away from an instrument, the music page. Hence, all constructive work in Music Form must be accompanied by practice in sight-reading. The exercises in a sight reading method serve admirably for a beginning. But one must continue beyond them. And the hint given above will serve us in the first application, to piano music, of the sight-reading habit. Pieces by Gurlitt, von Wilm and Reinecke, and the pieces in the collection of easy piano music published by the Hatch Music Company, furnish abundant material for practice.

The process should be :

I. To sing the upper line of notes—the one which is usually called the "air" or "tune."

II. Where this line divides and becomes two-voiced, whether frequently or for an occasional measure, to sing it into the second voice and to feel the force of the union.

III. To investigate the accompaniment and to see—first—if it be uniform in structure throughout. Even so common a figure as that which supports the usual form of waltz, with a melody in the Right hand and the so-called Tum-tum-tum in the Left hand, will be found to contain (in the chord changes and particularly in the progress of the first note of the measure) a subordinate melody, which brought out adds no little to the general effect of the piece.

But accompaniments vary. It is out of the question to indicate, in a few hundred words, just how to get through them all, vocally. It can be done, however, and the student will be surprised to note how the skill of the composer shines out, or does not shine out, in what he decrees the Left hand to perform.

In the August issue of THE MUSICIAN our Lesson will continue the suggestions already set forth for writing. And for the month's work in that particular, this time, the same varieties of melody as were given in the June MUSICIAN should be witten in the three minor scale forms: The Pure Minor Scale (the same ascending and descending—A, B, C, D, E, F, G, A); the Harmonic Minor Scale (the same ascending and descending—A, B, C, D, E, F, G, sharp, A); the Melodic Minor Scale (ascending—A, B, C, D, E, F sharp, G sharp, A) descending—like the Pure Minor Scale). The following brief rules may be helpful:

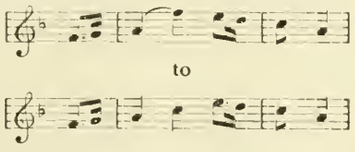
1. Write in all keys.
2. Sound the Tonic of the selected key at the piano, sing the scale mentally.
3. To know how your work *sounds*, sing it ; do not play it.
4. Do not be deterred from witing a melody because it "sounds like something you have heard before." Write it.
5. Write what you can remember from the concert and theatre. The habit once acquired is the gateway to others.

MELODY.

H. A. CLARKE.

In a former essay the statement was made that it seemed almost an essential of good melody that it should be largely composed of the diatonic scale. This diatonic constitution of melody was pointed out as one of the most striking peculiarities of Beethoven's melody, but there is another side to this question, since some of the most striking effects in melody are produced by disjunct motion, especially when it is used to unexpectedly interrupt a conjunct motion. One of the finest examples is the theme of the slow movement of Schumann's Piano Quartet, in which the melody alternates between a diatonic motion and a leap of a 7th, up or down, thus :

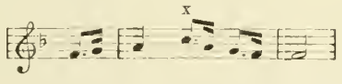
The exquisite grace of this melody is such as to make one almost recall that dictum about diatonic melody. In fact, we are obliged to say a melody may be in conjunct motion and be very beautiful, it may be in disjunct motion and be very beautiful, or it may be either, and be anything but beautiful. And thus we are brought face to face with the question, in what does the beauty of a melody consist? Many vain attempts have been made to answer this question. The writer knows of but one that seems to throw a little light on the mystery, one of the most profound writers on music—Gurney—in his work, "The Power of Sound," has advanced the hypothesis that "Music is Idealized Motion" and, in the course of his remarks, says that one of the chief elements of beauty in a melody is the unexpectedness of the motion. That there is a profound truth in this assertion there is no room for doubt. In every good melody there are certain critical points upon which the whole effect of the melody depends ; if a single note is changed at one of these points the character of the melody is completely destroyed. For example, take the familiar melody, "The Last Rose of Summer." Change the opening motion from



to

Observe the difference.

The leap of a sixth—from A to F—is one of these critical points. Change the F and the beauty of the melody evaporates ; in fact, this high F (tonic) marks every critical point in the melody. To illustrate this take the second motive



change the C to B (a change often made by singers) and the melody loses little if anything. Though this idea of "unexpected motion" is true, it is by no means the whole of the truth, since there are many melodies of unquestioned beauty in which there is no trace of "unexpected motion." For example, "Vedrai Carino" in "Don Giovanni." This is simplicity in itself, yet is there a more exquisite melody in the world? It may be said that much of the beauty of a melody is dependent upon its rhythm. Very true, as rhythm may also be called an "idealized motion," but what shall we say of those melodies that move in notes of equal value? For example, the melody of "Freude Schöner Götterfunke" in the 9th Symphony and "Yankee Doodle" are rhythmic counterparts. Both move in quarter notes with a slight pause in the 4th and 8th measures, yet one is instinct with nobility—the other—well, a musician cannot but regret that it was not forgotten with the trivial "words" to which it was originally written about "Lucy Locket" and "her pocket."

We do not seem to have made much advance in solving the mystery of good or great melody. Perhaps it is possible to make some advance by taking the negative side and saying what ought not to appear in a melody. First, there should not be too great extremes in the values of the notes, such as mixing whole notes and sixteenths. Second, there should be no long leaps, except where they will by their effort at once justify their presence. Third, the melody should be so constructed that it has a climax—not necessarily a loud climax or a high climax or any kind of intense climax—but a point where the interest culminates This point may be above or below the level of the melody, as the culmination may be an excess or a diminution of passion. Last, at the risk of being thought "old-fashioned," we add, the melody should be so constructed as to make it quite evident in what key it is written. It is not well to begin in C major and reach B major in the third measure by way of D♭. There is a larger number of melodic phrases that have been worn threadbare by constant use. Many so called compositions are entirely made up from these shreds and patches, the beginner should guard sedulously against their intrusion in his attempts at music-making. Indeed, it would be a work of great advantage to beginners if some experienced hand would compile a dictionary of these phrases, the only danger is that it might swell to the dimensions of "Groves'." A final word of advice, do *not* be in too great a hurry to publish your "opuses," the power of writing good melody improves wonderfully with time and practice, and you may possibly publish things at twenty that you will be disposed to deny acquaintance with at forty. There is a great deal of good music in the world ; unfortunately, there is even more that is not good. One should be very careful to discover to which of these departments he is likely to contribute before rushing into print. After all, to the great mass of our profession, the great object of study should be to understand, not to produce. Every intelligent teacher and pupil may learn how good music is written. It is only the privileged few who are gifted with the power of creating it.

NOTE.—Questions will be given in later instalment.

THE DEVELOPMENT OF THE PIANO.

FRANCIS L. YORK.

In our last paper we have seen how the piano developed into an instrument that was far superior to all the instruments that preceded it, inasmuch as it was possible to shade the tone by the simple pressure of the finger. But it must not be supposed that piano manufacturers were willing to stop here and rest satisfied with their achievements. Even if they had been willing to do so, piano players and the composers for the piano would have spurred them on to new effort. We can trace most easily the further advance made in the manufacture of pianos, if we inquire what were the defects of the older instruments, and then find what measures were taken to remedy these defects.

The principal faults to be found with the old instruments were a thinness of tone, lack of power, liability to get out of tune and liability of the strings and action to break if an unusual demand were made on their strength. In some actions, too, if the blow were too hard the hammer would rebound and strike the string again, making two tones, and a further defect was that the tone could not be repeated unless the key were allowed to come back quite to its original position. The different makers set themselves to remedy these defects.

First as to tone. With the old method of using thin strings of copper, brass or iron wire of poor quality, a thin tone was unavoidable. But improvements in steel-making and wire-drawing came fast, until at present piano wire is the strongest known material, and is largely used in scientific and mechanical work where great strength is a desideratum. At the Columbian Exposition, at Chicago, tests were made of wire furnished by Poehlmann, of Germany, with the result that a wire, only three one-hundredths of an inch in diameter, required a weight of 325 pounds to break it. In some modern grand pianos the average strain on each wire is 275 pounds, and this is, of course, greatly increased when the string is struck. This would give for the total strain of all the strings of a grand piano the enormous amount of nearly thirty tons. The Steinway Company claim that their frames are built to withstand a strain of 75,000 pounds, considerably more than the anticipated pull on the strings. The tone of the piano was much improved by the use of this stronger wire, and also by the use of thicker wire for the same pitch. For, with thicker wire, greater strain and greater elasticity, the singing or sustaining power of the tone is greatly increased. But the use of greater strains on the wires necessitated a much stronger frame for the piano in order to withstand the greatly increased pull. About the year 1820 iron was introduced into the frame of the piano to give it greater stiffness. Before that time the frame had been made entirely of wood. At first the makers used only iron bars and braces to assist the wood, but afterwards more iron was constantly introduced until at present the whole frame of the piano, even in the largest grands, is cast in one single piece with all the flanges and braces that are required to give stiffness to the frame. Many were the devices used in the early pianos for strengthening the frames—rods, flanges, tubes and bars of various shapes and acting on various principles were introduced, only to be cast

aside when, finally, the frame was cast in one piece. It will be seen that the piano has enormously increased in weight in the past few years—the time has passed when it was a small matter for a composer to take his piano with him out into the fields to help him in composing, as was stated of Gluck in our last article.

The next defect to be remedied was that of a lack of power. The power of the tone was somewhat increased by the use of thicker strings, as just described, but with heavier strings and a higher tension, a heavier hammer was possible, thus allowing the player to strike a more powerful blow and making a tone of greater volume. This required all parts of the action to be made more strongly, and various precautions were taken to strengthen all the parts, so that the heavy blow, when it did come, would find all the parts in the best position to withstand the strain. The power of the tone has also been increased by so making the leverage of each part of the action that as nearly as possible all the power put on the key by the finger of the player is transferred to the string. A hammer, moving through a long distance, will attain a greater velocity and thus strike a harder blow than one moving through a short distance. Thus, by a proper arrangement of the action, a moderate blow on the keys may be made to produce a strong blow on the wire. There are other ways, too, in which the power of the tone has been increased. As the piano case increased in size, the sounding-board became larger, with a corresponding increase of the tone. The proper adjustment of all the parts so that the player gets the greatest possible effect from his work is a matter requiring not only the greatest knowledge of acoustics, but also the greatest care in the selection of materials, the greatest skill in nice coordination of parts, and, in addition to all these, an unusually good ear. Even with the greatest care, the greatest skill, the best materials, long experience and a determination to produce an art work—for a fine piano can be called no less—even with all these the best manufacturers will, at times, produce an inferior instrument. We have all seen pianos of the best makes that were very unsatisfactory, and that, too, probably through no fault of the makers.

The danger of a piano getting out of tune was a very real one. In the olden times, even within the memory of living concert-goers, it was almost as customary for the piano to be tuned between the numbers on the program as it is now for the violin and other instruments of its class. The defect caused by this liability to get out of tune was remedied partly by some of the improvements already described. If the wire was of poor quality it would stretch and, of course, get out of tune. If the frame of the piano was not of sufficient stiffness it would give slightly under the enormous strain with the same result. There are so many causes that influence the tone and the stability of the pitch in a piano that one hardly knows which to speak of. For instance, if the part of the string beyond the bridge, that is, between the pin to which it is attached and the bridge which regulates the length of wire that is to sound - if this part does not convey the tension from the tuning-pin over to the sounding part of the wire, then the piano will not stay in tune, for if the sounding part is put in tune and left so without equalizing the tension throughout the whole length of the string, then when the hammer has struck the string many times, as in playing, the tension gradually becomes equalized with the result that the pitch is changed and the string is out of tune. Another cause of a piano getting out of tune was a slight lifting of the string from the bridge by the impact of the hammer on it, making the string for the moment a trifle longer, and, of course, changing the pitch slightly. This has been remedied by putting the string through a small hole drilled in the iron of the frame and then bringing the string to bear upward so that when the hammer strikes it the string is forced against the bridge instead of away from it. In part of the scale the same result is produced by the capo d'astro bar, which is an iron bar brought to a blunt edge and, pressing on the strings from above, forms a bridge or fret against which the strings are driven when the hammer strikes them.

Although the increased power of the hammer blow would tend to increase the danger of breaking the strings, the increase in the strength of the strings has more than kept pace with the increase of the blow, so that now a string rarely breaks unless it has become weakened by rust. In the older pianos the action itself frequently broke during a concert, especially if the man was a man gifted with muscle. It used to be a standing joke that Liszt required three pianos to give a concert on. And, joking aside, it was no uncommon thing for him to put his piano *hors du combat* at a concert, and be obliged to have a fresh one brought on the stage before he could finish. Such unheard of demands on the part of the player, however, were soon met by the manufacturers, so that now it is extremely rare that any part of the action gives way during a concert.

To prevent the hammer rebounding and striking the string a second time even the earliest makers invented a check, Cristofori himself in his later pianos having the prototype of the device still used for the purpose. The difficulty of "blocking," that is, of the hammer staying against the wire when it should fall back, is rather one of adjustment than of system. Pianos nowadays will block, but it is only when the action becomes deranged and the difficulty can usually be easily remedied.

But one of the chief problems that the inventors set themselves to solve was that of repetition. Every pianist knows that it is frequently desirable to repeat a tone *legato*, that is, to cause the tone to speak again before its previous sounding has ceased To make this possible the action must be so arranged that the hammer can be thrown again against the wire without letting the key return to its position of rest. To solve this problem many different actions have been invented, the most famous of these being, perhaps, the "Erard double escapement." This action is too complicated to describe at length; it is enough to say that it fulfilled its purpose completely. The action now in use by many of the best piano manufacturers is a modification of this action called the Herz-Erard action, each manufacturer having some special feature found only in his own piano. There is also the so-called English action which, though much simpler, is very efficient.

Thus we see that all the defects mentioned at first have been remedied one by one. But piano manufacturers have not been content with the simple remedying of defects, they have constantly striven to make still further progress and to invent new effects or to bring the piano under still more perfect control of the player. No doubt many of the so-called improvements are of very little value and, from an artistic point of view, are an absolute detriment to the piano, as, for example, attachments which aim to give the effect of various other instruments. Such arrangements are curious and sometimes ingenious, but artistically they are to be classed with the "one-man-band," sometimes to be heard on our streets.

The best instruments of the best makers of the present time may, I think, be regarded as the culmination of the piano proper. It seems to me that any farther *development*, using the word in its proper sense, is scarcely possible. There will, no doubt, be changes in the construction of the piano, but as far as can be seen the piano can scarcely be further *developed*. This need be no cause for sorrow. When an instrument has reached the perfection of the modern concert grand little remains to be desired. The violin has not been improved or developed since the time of Stradivarius and Amati, and it may be that the piano is incapable of improvement as far as the main features of construction are concerned. Matters of detail may be changed and perhaps perfected, but otherwise the limit seems to have been about reached. When we consider the possibilities of the piano, the infinite tone colors of which it is capable, the perfection with which all kinds of music can be produced on it, the gradations of power from the faintest pianissimo to the thundrous chords of Paderewski or Rosenthal, the endless combinations of harmony, melody and polyphony of which it is capable, and especially the fact that all these effects can be produced either simultaneously or in immediate succession by one player by merely changing the way in which he uses his hands without removing them from the keyboard itself, we may well regard the piano as an instrument as nearly perfect as imperfect humanity is likely ever to reach. However, as man is never satisfied, attempts are being made at present and have been made in the past to simplify, improve or change the scope of the piano's powers. In our next paper it will be our endeavor to describe some of these and to give a hint of what the fnture may possibly have in store for the king of all instrnments—the piano.

QUESTIONS.

1. What were some of the principal defects in the earliest pianos?

2. How do the strings of the modern piano differ from those of the first instruments?

3. How was the piano frame made sufficiently strong to withstand the pull of the strings?

4. Name some of the causes that make the tone of the modern piano fuller, of better quality and of greater sustaining power than that of the old pianos.

5. Give some reasons why a piano may get out of tune.

6. Name two of the best known piano actions.

A GUIDE TO THE STUDY OF MUSICAL LITERATURE.

ARTHUR L. MANCHESTER.

While it is to an Englishman we owe the two excellent books mentioned last month, American literature does not take second place in the production of musico-literary criticism and analysis. About three years ago the attention of music lovers was drawn to a new publication which appeared under the striking title, "Mezzotints in Modern Music." A suggestion of that method of engraving known as mezzotint, with its near approach to photographic effect and its likeness to nature, and a sense of delicate shading, were at once felt by the discriminating book lover. There was an intuitive anticipation of a species of word painting in which all the resources of the English language would be drawn upon.

The writer, James Huneker, unlike the Englishman, was not unknown to us. His contributions to periodical literature were widely familiar, and he had made a reputation as a manipulator of words. And not this alone. Those who read him knew he had something to say, which his glowing, vividly colored style made very impressive. Hence, this book was not put forth as a totally uncertain venture.

As one read the book he realized, in no indefinite way, that the author was a man of convictions, albeit he would occasionally pause to question the absolute sincerity of certain statements. Further, he was certain to be strongly impressed with the comprehensive knowledge and brilliancy possessed by Mr. Huneker, and while, as just said, he might question the soberness of the author's judgment in all particulars, he would be assured that underlying all was a vein of truth and power that could not but prove stimulating to a high degree.

The book is a study of Brahms, Tschaikowsky, Chopin, Richard Strauss, Liszt and Wagner. Subjects with which Mr. Huneker was admirably fitted by temperament and practical learning to deal. An insight of the author's keenness is furnished by the chapter headings. Brahms, about whom has raged a controversy almost equal to that inspired by Wagner, he discusses, under the caption, "The Music of the Future." His comparison of Brahms with other composers is courageous and based on strong premises; his estimate of the composer will arouse thought from which must come a clearer understanding of his works and a surer judgment of their worth. There is much in this essay, as well as in the others, which one would like to quote, statements couched in terms that send them to the heart of the matter with certainty and force.

Tschaikowsky, another subject of dispute, is called "A Modern Music Lord." Here, again, the temptation to quote is strong. "On the Doorsill of the New Century" pictures most vividly the beginning of an era. "Richard Strauss and Nietzche" and "The Greater Chopin" are further biographical and critical studies. "A Liszt Etude" and "The Royal Road to Parnassus" are dissertations on piano playing, composition and study that are invaluable. Mr. Huneker's wide knowledge, clear perception and keen analysis are shown to advantage in this part of the book, and the result is a series of essays from which the piano teacher and student can derive inestimable good. The book closes with "A Note on Richard Wagner."

A year after the issuance of this noteworthy addition to musical literature, Mr. Huneker sent out another which, if possible, surpassed its predecessor. For some time a series of essays on Chopin, from the pen of this author, had been appearing in a music journal with which he was connected. In 1900 they were published in book form under the caption, "Chopin, the Man and His Music." To one of Mr. Huneker's temperament, the morbid genius and tragic life of Chopin afforded a fine subject on which to pour forth the red hot lava of thought and idiom with which our author impresses his meaning.

Of all the studies of Chopin this has taken precedence as a convenient and yet comprehensive work.

One who reads it will live with Chopin, will feel and suffer with him, and thereby come to know him as never before. The evoking cause of the music which the composer bequeathed us will be better understood, as will the moods with which it is filled. To his study of the man, Mr. Huneker has added a study of this music which is exceptionally valuable. A pianist himself, a student of piano and piano music, familiar with virtuosi and their methods and, withal, a musician to the core, the result of his analyses of Chopin's music is remarkable.

As a means from which to derive direct musical knowledge these books are helpful. But they can exert a still greater influence than this. The music student considers it a part of his business to acquire an appreciation of clear and forceful technical expression. He makes especial effort to become familiar with the technic of musical speech; he must discern and appreciate that use of musical material which is best adapted to bring out the musical thought and to emphasize it. If he will take the same pains with his mother tongue—the English language—he will be surprised at the increase in discernment which comes to him. These two books are well adapted to open his eyes to the possibilities which lie before the user of English. Mr Huneker's vocabulary is filled with words that scintillate; his idiom is of a mold peculiarly his own, and while exaggeration may at time mar his work, to read him is well worth the time of the busiest musician.

A DREAM OF GOOD TIMES.

Let us dream of the good times—the good times to be,
When the fair fruit shall bend every branch o' the tree
And the rivers in music shall sing to the sea,
And the world will be joyous forever!

Let us dream of the good times—when blithest farewells
Shall be said unto Sorrow in cities and dells;
With only the bird-songs—the chime o' the bells
In a world that is joyous forever!

Let us dream of the good times, when over the wrong
The white Right shall triumph with bright sword and strong;
When the wide world shall echo one jubilant song
In the light of the morning forever!

—*Atlanta Constitution.*

THE STUDY OF A SONATA.

Beethoven's Op. 2, No. 3, in C.

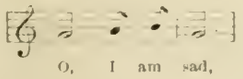
DR. HENRY G. HANCHETT.

FIFTH ARTICLE—HARMONY.

Number measures by placing a number before every bar—single or double—following the order as printed, not as played, counting measures regardless of their completeness, and beginning again with number one at the opening of each new movement and considering the "Trio" as a new movement. This plan accords with "Harding's Analysis."

As rhythm is the element of composition upon which music depends for its vitality and stimulation, so harmony is the element upon which it mainly depends for its "soul," its significance. Expression is a very broad term, and there is no element entering into the total effect of music that may not be used by the composer to give meaning to the work, but still the emotional expression depends more upon harmony than upon any other single item. The most palpable consideration of this sort is the popular distinction between minor and major. These terms have passed into language as expressing respectively the pensive and the cheerful, the sad and the joyous; and yet, as we shall see later, there is no necessary relationship between mode and mood.

Harmony comprehends all those considerations that grow out of the relations of musical sounds simultaneously heard or assumed. I say assumed, because any person who knows enough about music to think or talk intelligently of the art, is sure to associate musical sounds with appropriate harmonies, even if they are not fully written out by the composer. Mr. A. J. Goodrich, in his valuable little book called "Music as a Language," says: "If I should sing,



O, I am sad,

nobody would believe me. The remark is probably true, and if so, depends upon the fact that, in the absence of any harmonization, the ear naturally assumes the melody to be in the key of G, and to be accompanied by the tonic and dominant harmonies in that key. But while that assumption is natural, it is by no means inevitable, and by using the identical melody, but writing it in the key of E minor and accompanying it with the tonic and dominant seventh (first inversion) in that key, the sentiment and the music will be found in perfect accord. But there is nothing to lead the mind to think of the melody as in the minor mode and by preference it seems to assume the major. So, in the first movement of our sonata, during the 45th and 46th measures, we imagine the harmony to be constantly that of D major, but several other chords might have been made to accompany the melody printed. In measures 76 and 77 the notes C, D, G almost force one to think of a complete cadence, yet the harmony is only assumed.

The most important consideration connected with harmony is attunement, or the recognition by the ear of a certain tonic and mode as governing the relations of all the sounds heard in any passage. Much of the difficulty experienced by the uninitiated in enjoying elaborate compositions is due to the fact that the masters use such a wide range of harmonies and so large a proportion of chromatic tones that to them the tonic and mode become obscure. Popular tunes are nearly always restricted to the tonic, subdominant and dominant harmonies, with pehaps an occasional relative minor chord and a few chromatic tones selected from the scales belonging to the chords mentioned. But the skill of a composer consists largely in the introduction and use of a wider harmonic range, not for the sake of solving problems in progression, but to lead the mind through longer excursions and broader vistas of emotional possibilities; in other words, to maintain interest and heighten expression. The so-called sonata form consists largely of a musical exploitation of a specific series of tonics. In the first movement before us, for example, one notes the predominance of the attunement of C major from the beginning to measure 26, then of G minor to measure 45, then of G major to measure 90. From that point the ear is led from one attunement to another in a gradual but very effective way (C minor, F minor, E flat major, C minor, F minor, etc., each key enduring but a few measures) until measure 130 is reached where, in spite of the frequent use of E flat, pointing to the attunement of G minor, the ear insists upon regarding the G as a dominant and the attunement of C major as imminent, if not established. At measure 136 all doubt is removed, and at measure 140 the complete reinstatement of C major is accomplished and maintained till measure 161 is reached. At this point one notes the recurrence of the ideas of the earlier part of the movement, but now in the keys of C minor and C major, up to measure 219, where Beethoven startles us by the unexpected introduction of a key entirely unrelated, namely that of A flat major, which is maintained through the 224th measure. Then the mihd is led through eight measures of discords, having the effect of complete bewilderment to the sense of attunement, until the diminished seventh of G minor is resolved into C major at the beginning of the cadenza, and from there to the end that attunement is maintained.

But the prevalence of the attunements mentioned in no way hinders the composer from introducing chromatic tones and unusual cnords. The C sharp in measure 3 has no tendency toward the key of D, because the F natural negatives D major, and the B natural negatives D minor, and without such specific obstacles in measure 19 the G sharp and C sharp yet fail to convey to the ear the impression that they are leading notes, although they might possibly have been so treated had the composer desired. In measures 20 and 21 the F sharps come nearer to inducing a change of attunement, but the prompt restoration of the F natural leaves the attunement unchanged at least until measure 25, where the ears decision for G major has quickly to be revised for the G minor of measure 27. The whole passage, up to measure 25, must be conceded to be in C major, and yet, in spite of its simple progressions and persistent attunement, the composer has shown himself a master of harmony, and in measures 7 and 11 has introduced quite unusual chords.

Allusion has already been made to the fact that the minor mode does not necessarily imply a sombre mood and evidence of this may be derived from the passage in this first movement beginning with the 27th measure. While the passage at first is negative in sentiment, when the 39th measure is reached there is a playfulness and piquancy that drive away all gloomy thoughts, in spite of the minor intervals, and much the same thing is true of the passages beginning at measures 91 and 114. But the best illustration of the fact stated is to be found in the trio of the third movement. Here playfulness and minor chords are equally in evidence throughout. Again in the third movement we find a right jolly minor passage beginning with measure 46. Minor certainly lends itself more readily to the sad and sombre than does major, but many a pleasantry can be produced with minor chords.

An interesting line of investigation for the harmony student is with reference to the unusual resolutions of discords and the methods of changing keys as to whether a temporary transition or a complete establishment of a new attunement by modulation is effected, and whether the latter is natural (calling for a signature change of not more than one sharp or flat) or abrupt. For example, in the Adagio movement, measure 5, we find ourselves temporarily in the key of F sharp minor, but there is no modulation to that key. The tonic triad of that key is also a member of the key of E, in which the movement is written, and the E sharp, which makes the difference between the two keys, comes *after* the start in the new key—it is a temporary transition to a related key. From measure 10 to 11 we pass from E major to E minor—a change of three sharps in signature. The final chord in 10 is the dominant seventh of either key. It is an abrupt modulation. This same chord is made to serve as the connecting link in a still more abrupt change to C major, from E major, in measures 52 and 53. The student should look up the other changes of key and see how they are brought about. A pretty point to think about also is the reason (if any can be discovered) why Beethoven, in the last movement, makes measures 42 and 44, otherwise identical, in both modes of the same key, while measures 230 and 232, corresponding in other respects to the earlier measures mentioned, are both in the same mode.

As a preparation for future studies it would be well for the student to make out a scheme of the key successions in each of the movements, using a letter to indicate passages that occur more than once. For example, in the Scherzo we have "A" at the beginning and at measure 41; "B" at measures 9 and 49; "C" at 30 and 59. This scheme will be helpful, although later when we come to study form a similar lettering is be recommended, which may not agree with what the student may insert in his key scheme. The idea now is simply to note the different keys in which the same thought is presented.

[NOTE.—Two errors in June article are corrected as follows: In second column, first line, "eases" should read "basses;" and in the seventeenth line (counting from the bottom) of the same column, it should read "quarter note followed by two quarter rests."]

Admirers of Wieniawski (their name is legion) will be interested in the following authentic anecdote. Even many years after Wieniawski had achieved distinction, Massart his teacher, seemed unable to appreciate that his beloved Henri had passed through childhood's years and was at last a full-fledged man as well as a celebrated artist. Often he touchingly revealed the fact that, to him at least, the great Polish master was still "his boy," however changed might be the conditions of Wieniawski's life.

On the occasion of a visit to his old-time master, Wieniawski found Massart in a contemplative mood, holding in his right hand a cane upon which his fingers were actively engaged in imaginary technical exercises. With a roguish smile Wieniawski asked: "Are you practicing trills, dear master?"

"Ah, my boy," was the serious reply, "you should not jest on such a serious matter. Trills can be studied with profit even on an ordinary stringless cane."

"But," rejoined Wieniawski, with a merry twinkle in his eye, "if that is the case, do you not think it would be a good idea to transfer your cane from the right to the left hand?"

The lady who knows all about music and doesn't let anybody within reach of her voice overlook the fact, leaned back in her chair.

"That's a dainty thing they're playing," she said, gazing patronizingly toward the band. "What is it?"

"Grieg's," began the ordinary man, looking at the program.

"Oh, of course," she interrupted, "I needn't have asked if I'd waited to hear more of it. How weirdly, characteristically Grieg it is. One always hears that ever-recurrent note of sadness in everything Grieg does. It is exquisite."

"'Tis pretty," assented the ordinary man, "only I looked at the wrong number of the program. The Grieg thing is next. This is "The Ghost of a Coon."

FOR THE YOUNG PEOPLE.

The Young Musicians' Perseverance Club.

Conducted by ARTHUR L. MANCHESTER.

I expect our Clubmates are in the midst of their summer vacation. May it be a very pleasant one. Our story this month has no questions attached. They will be included next month. This will give us time for a rest and prepare us for future work. It is too warm for sermons or lectures, so we will see who have answered the questions and have our monthly chat and story.

These are belated senders of May answers:

Emma L. Olmstead.
Ethel C. Porter.
Corinne C. Johns.
Ida Cecilia Price.
Margaret McGuirk.
Letitia C. Marlowe.
Mary Cecilia Cleary.
Florence A. Cross.
Carol Robinson.
Genevieve Johns.
Lela Busbey.
Marie Josephine Timmins.

Here are the answers to the June story:

1. "Lord, have mercy on us."
2. Praise Jehovah.
3. Responsively.
4. Two or more sounds having the same pitch.
5. A note or chord sounded with a tremulous effect.
6. Having the measured beat that marks the character and expression of the music.
7. A key, or mode.
8. The name given to tones intermediate between the tones of a key.
9. A vibration between a chief note and its auxiliary above.
10. A melodic ornament.

And the names of those who have sent answers:

Lorena G. Timmins.
Anna H. Coogan.
Leonide Timmins.
Ida Cecilia Price.
Mary Cecilia Cleary.
Margaret McGuirk.
Letitia C. Marlowe.
Kathervn Landers.
Alma Kernan.
Cora Overbaugh.
May R. Keefer.
Marie Eldridge.
M. Camille Bunty.
Mary C. Smith.
Mary Johns.
Maud Busbey.
Lela V. Busbey.
Genevieve Johns.
Marie Josepha Timmins.
Corinne C. Johns.
Helen G. Johns.
Ava E. Miller.
Mary McCann.
Estelle E. Keefer.
Genevieve Overbaugh.
La Bell Mahoon.

This new member is thirteen years old. Her ambition to become a good pianist can be satisfied if she will work patiently and steadily.

INDIANA, PA.

Dear Mr. Manchester—I saw your questions in THE MUSICIAN and wish to answer them. I have taken music for two terms and take from Mathews' Grade II. I like music and hope to continue it and become a good pianist. I hope to see my name in the next number of THE MUSICIAN. I practice an hour daily. I enjoy reading the childrens' page and would like to become a member. Yours respectfully,

BERTHA JONES.

This is a busy member. If he does his work well, he can be sure of success. We all wish him steady progress.

ELIZABETH, N. J.

Dear Sir—I am in the Junior Latin Class in the High School and have plenty of lessons. Besides my lessons I have two evenings in the week for pedal organ practice which I like very much. Through the kindness of Professor J. V. Rouselle, my teacher, I practice on a fine three-manual pipe organ in St. Patrick's Roman Catholic Church in this city, where he is organist. On Saturday mornings I generally get my piano lessons, and in the evenings I have choir practice. I intend to make the organ my special study. It comes very easy to me, and my teacher had said that I do not need any lessons on the pedals, but only practice until he will begin to teach me the stops. I am very interested in The Young Musicians' Perseverance Club and like very much to study and answer the questions every month if I am able to do it.

Yours respectfully,

P. S.—I will send my photograph later. JOHN C. JOHNSON.

We are glad THE MUSICIAN is pleasing this member. We are trying to make it both useful and entertaining.

HANGING ROCK, OHIO.

Dear Mr. Manchester—I like the stories of THE MUSICIAN very much. I am twelve years old and am in the sixth grade at school. I am in the second grade of the "National Graded Course," and am nearly through with it. I have taken a few pieces from "Schumann's Album for the Young," and from Hiller's Op. 45, No. 21. And I have also taken "By the Meadow Brook," by Wartenstein. I like my music very much and like to practice a little better than I have formerly. I think there are some very pretty pieces of music in THE MUSICIAN. I like finger exercises very much. Wishing the Club continued success. I remain,

Yours truly,

RUTH WILLARD.

Yes, it is better to send answers late than not at all. This member will have a treat at the Association meeting.

SPRINGFIELD, ILL.

My Dear Sir—I have been very busy with my school studies this month as it is towards the close of the year, and did not get my answers written soon enough. But it is better to be late than not at all. I guess these answers will be my last till September, for I am going away for my vacation very soon, and there will be no books for me. I am going to the Illinois Music Teachers' Association next week. Yours very truly,

Age, eleven years. CAROL ROBINSON.

This is a faithful member. Our McSherrystown members are splendid workers. We must all keep up with them.

MCSHERRYSTOWN, PA.

Dear Mr. Manchester—A good many of us are late with our work this month. I am sorry and I guess the other girls are. I was sick the day Sister took the little girls to help them get the Club work. This is the first month this year I have not sent in my answers in time. My little sister Genevieve is in your Club now, and Lela Busbey too, is a member, and little Marie Timmins, so I am not your youngest McSherrystowner any more.

With best wishes, I am

CORINNE C. JOHNS,

Although short, this letter is welcome and we hope to have others.

CORPUS CHRISTI SCHOOL, CHAMBERSBURG, PA.

Dear Sir—As this is my first letter to you it will not be very long. I am eleven years old and take music lessons from the Sisters. I like the Club. I am interested in the stories and letters. I remain your new Club member,

HELEN ENGLERTH.

TWO MUSICAL MISSIONARIES.

In the "Cathedral of the Sun," a tumult and confusion prevented the priests from finishing the service, and it was in vain that they called loudly to the people from the altar-rail, commanding silence. The choristers and musicians shouted excitedly, urging the people to seize Romanus and Petrus and thrust them from the Church, calling them apostates, outlaws and even sorcerers in disguise. But the people, though joining in the cries and tumult, were held in check by the quiet fearlessness of the young monks, and among them, too, were those who regarded Romanus as possessing some supernatural, or wizard-like power. His quiet self-possession, and the pale face with its great, dark eyes, looking out from the monk's cowl, filled them with awe. But the Benedictine dress would have protected the monks, even had they seemed less afraid, as they made their way toward the entrance doors, through the crowd, which parted on either side, and even shrank back from them, although the singers and musicians were still shouting orders to have them seized and taken before the city authorities.

They left the Church in safety, and were calmly descending the slope, leading to the main street of the cathedral town when hasty footsteps sounded behind them, and they faced about. An altar-boy, still in his white surplice, stood breathless before them in the evening dusk.

"The Chief Father would speak with thee," said the priest's messenger, and the monks turned back to follow him.

The people were thronging from the front doors of the temple as the boy led the way to an empty court. He entered the temple by a narrow side entrance, and the musical missionaries, following, were ushered into a little room leading from the chancel. Here in his gorgeous priestly robes the cardinal sat in a tall, carved chair; he looked kindly toward them, and they bowed themselves at his feet to receive his blessing. When they arose, he questioned them much about the chants of St. Gregory, and finally it was agreed that they should pass the night at the cardinal's house, in order that he might examine the Antiphonarium, and listen to their illustrations from it in song, with a view to adopting it, if possible, for the Temple service.

And thus it happened that upon the following day, even as Romanus and Petrus were leaving the cardinal's palace, an ambassador was being sent without delay to the Monastery of St. Gregory the Great, to beseech in the cardinal's name that singers might be sent thither at once with copies of the Antiphonarium, promising that upon their arrival the instruments should be banished from the service, and the new order of chants adopted.

Romanus and Petrus were joyfully hastening to the city gates to continue their journey toward Metz, when they were again held by the press of people, who were making their way in the morning sunlight with one accord toward an immense pavilion, erected in the very heart of the city. An opera was to be performed here as part of the celebration of the Feast Day. In those days the opera was held as sacred as a religious service, so the young monks entered the pavilion with the throng, and decided to remain and witness the play.

The pavilion, which was a vast amphitheatre, was strung with myriads of flags of red and purple and orange, and the seats rose tier above tier in a vast circle around the pit, or stage, where the performance was to be held. The players entered from an underground room. Musicians playing upon all manner of odd instruments surrounded the stage in a circle, and great must have been the discord, which sounded like mightiest of inspiring strains to the thousands of listeners rapidly ascending to, and filling the seats.

When the whole city had assembled, and all was quiet in the pavilion, the musicians played a fanfare, which was meant for wedding music. When it had ceased, a strange figure was seen ascending the steps leading from the invisible rooms underground. He was dressed in a Greek costume of scarlet and white silk, and wore a scarlet hat with beautiful white plumes, and coming forward upon the stage told the people about the opera.

The play, he said, would present the Greek myth of Orpheus and Eurydice, and in the first scene they would see Orpheus, who was a wonderful musician, sitting in the forest and playing upon his lyre; for after winning Eurydice for his bride he played such beautiful music that all the birds flew circling round his head, and the wild beasts came to lie at his feet and listen.

After explaining the first scene the strange figure withdrew, and about twenty helots, or ancient scene-shifters, sprang up the stairway, some covering the stage with tall painted trees, others letting loose beautiful plumaged birds from their hands, while others placed various animals, stuffed and in a crouching position, at the feet of a magnificent young man who had entered and established himself beneath a spreading tree in the centre of the stage. He reclined there in majestic grace, while the musicians played their wild music, and every eye in the pavilion was upon him. The helots had vanished as by magic, and he was alone with the beasts, and the birds, which seemed to have mistaken the trees for real trees. The musicians ceased playing, and he lifted his lyre. His shepherd's cloak was thrown loosely over one shoulder, and his head and hair were encircled with a wreath of bay-leaves. As he played most beautiful and dreamy music, and the brilliant-plumaged birds floated about him, all the people cheered, thousands of handkerchiefs were waved, and shouts went up as he finally walked backward off the stage, waving his lyre in response.

In the several scenes that followed, the figure in scarlet and white appeared first, explaining each one, then the helots arranged the scenery, vanishing immediately, while the musicians played until the actors were ready to do their parts. While the second scene was being prepared, the music was a doleful contrast to the wild, gay jangle with which the first scene had opened. It was meant to sound like a mournful dirge. Orpheus appears in this scene leaning in anguish upon a tomb, over which many beautiful youths and maidens are strewing flowers, while their voices sound above the orchestra in a solemn chant. Slowly they depart from the stage, the chant sounding further and further away until it ceases. As tho' rising from the ground a figure appears at Orpheus' side. It has wings and sparkling raiment, and its beautiful face is radiant. It tells him that it has come from the gods upon Olympus, who have been moved with compassion at his anguish, and have sent him the message that if by his music he can appease the goblins of Hades, he may enter there and bring Eurydice back to the world.

In the third act a partition is removed from beneath the stage and the underworld is seen. Flames shoot up from yawning rocks, and in their glare the phantoms rush hither and thither as the music of Orpheus' lyre is heard. Madly they call upon Cerberus to "kill thy new Prey here," and the barking of the triple-headed monster sounds above the wild music of the orchestra. Gradually all becomes quieter and calmer, then by degrees all sounds have ceased save the gentle music of Orpheus' lyre.

(Conclusion and Questions next month).

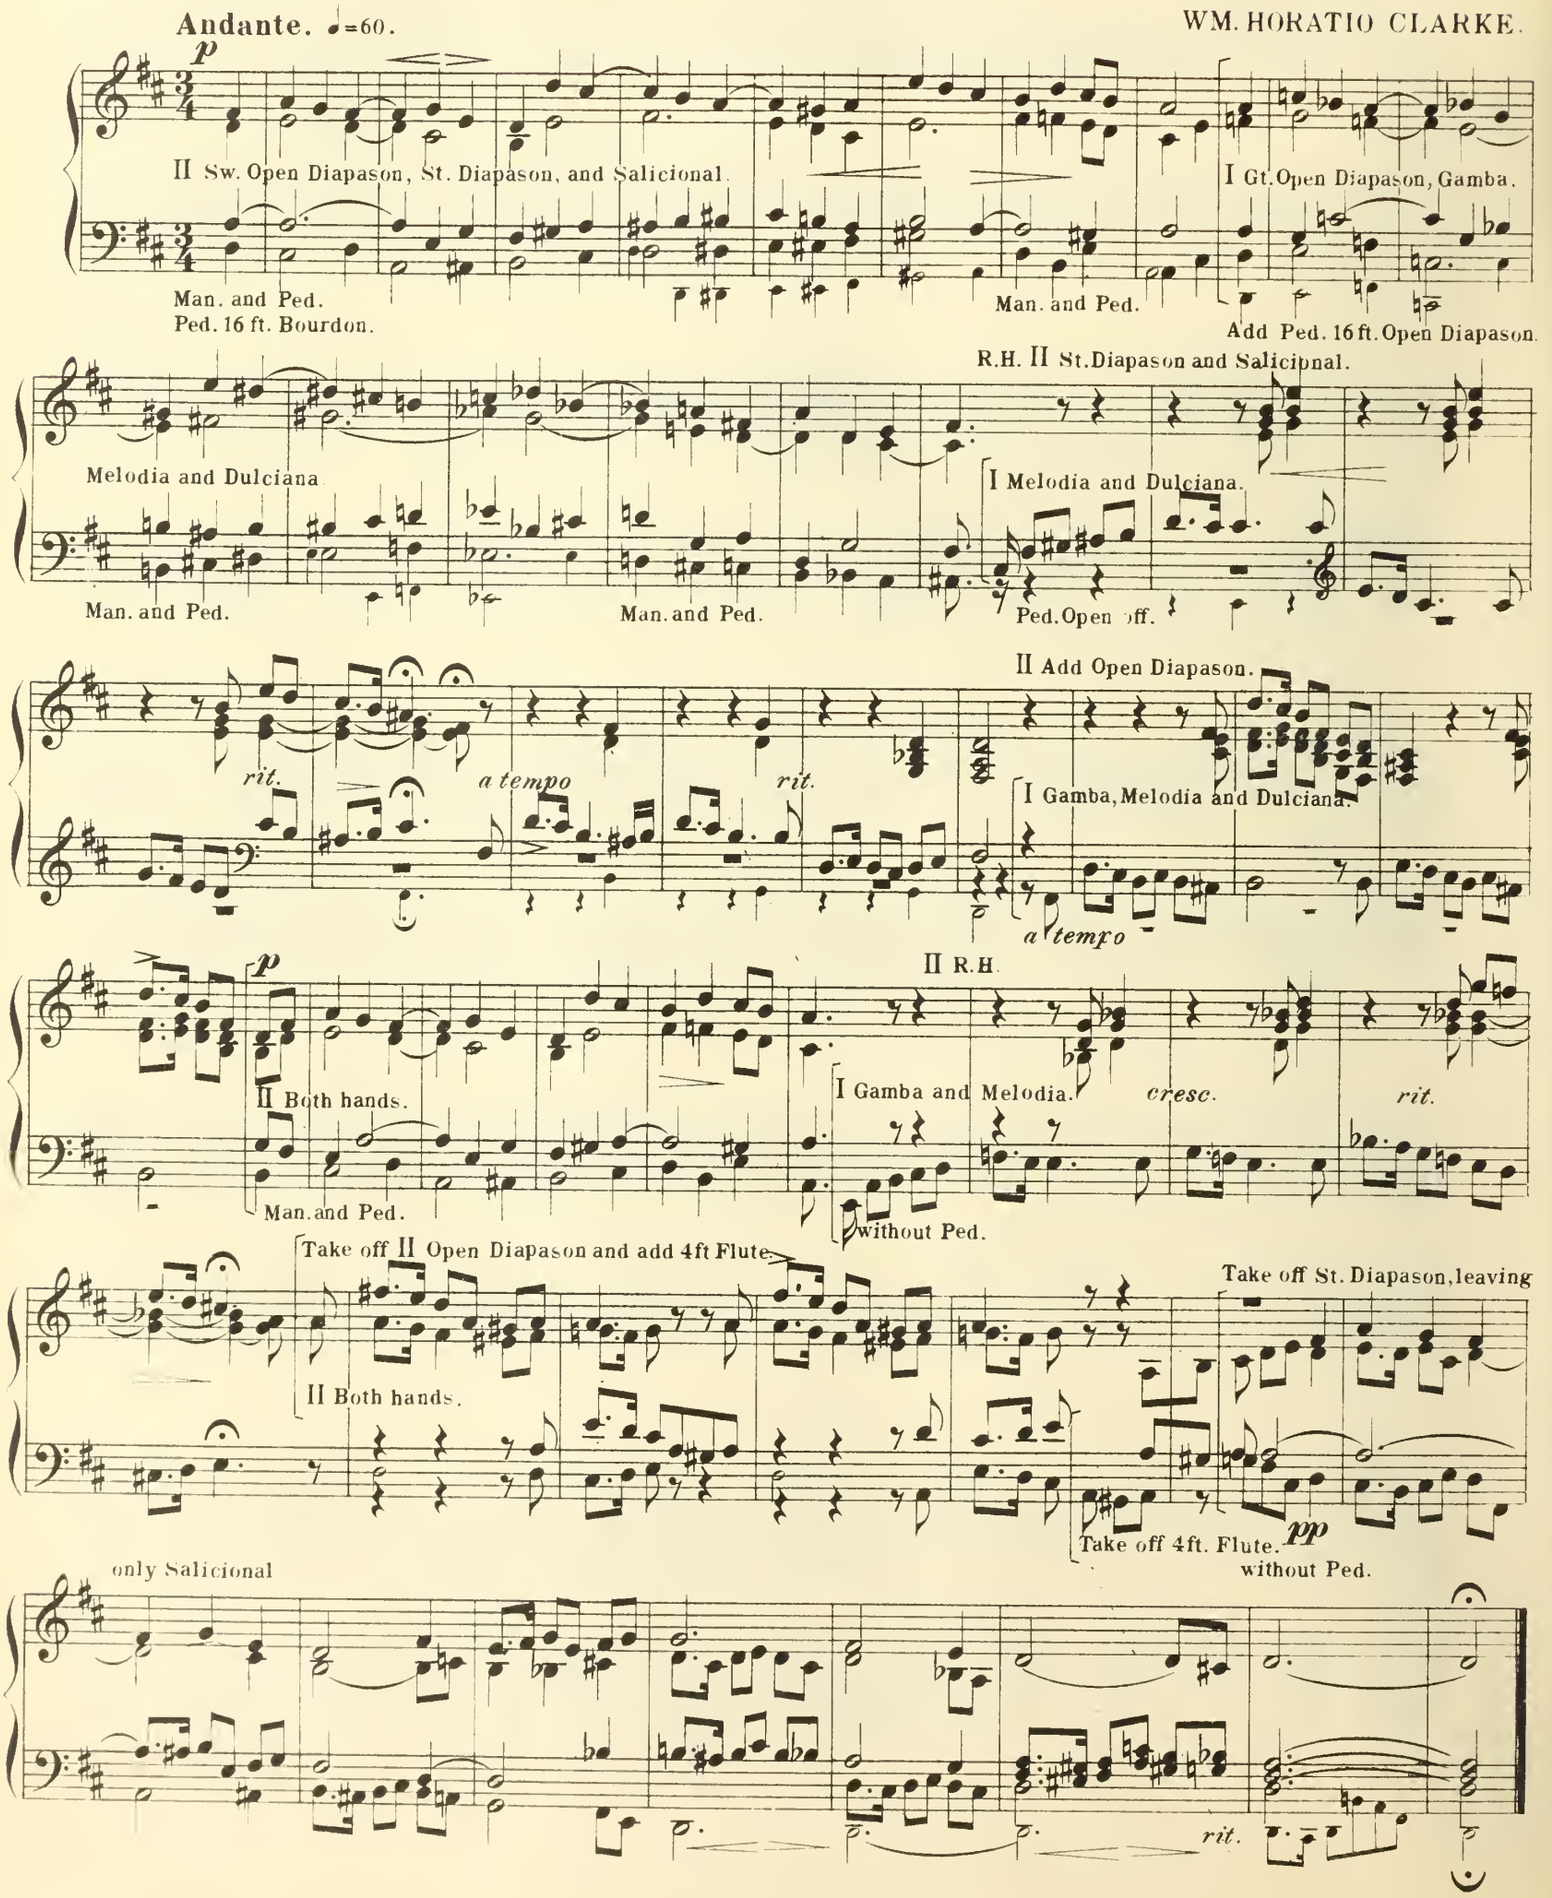
ANDANTE RECITATIVE.

WM. HORATIO CLARKE.



WOMAN'S PAGE

Conducted by Miss S. C. VERY.

THE YEAR-BOOK.

Within the past year THE MUSICIAN has sent, by request, year-books to Utah and Massachusetts, to California and to Mississippi, to Maine and Kansas, in addition to States included within that portion of our country bounded by these widely distant ones. At time of writing added petitions are on hand from West Virginia, Iowa and Indiana. Indeed, the demand is constant and can be met, excepting during Spring and Summer, when the club members, in preparation for the next season's program, suddenly feeling the need of suggestions, as suddenly send on a request that books be sent "*immediately*." Wholesale orders cannot be filled. Therefore, for the benefit of those who in the future shall seek counsel, we say: "Apply early and return promptly." In this way you will ensure benefit to your club and, too, prove yourselves exponents of the Golden Rule. Once securing year-books, do not deem possession nine points of the law.

In year-books of the youngest clubs there is to be noted an attempt at too much; after a year's feverish pursuit of the aim they conclude material at an end and study completed. To these it might be suggested, "Plan for three years rather than for one." The oldest clubs, after systematic courses of investigation, realize that a large amount of work is still to be done. For, as music's ramifications into the realm of æsthetics, science, metaphysics, etc., make its study a comprehensive one, so are its sources of information inexhaustible. Fraternal help, by willing interchange of ideas, will advance the cause common in clubland.

The loan of year-books from THE MUSICIAN is gratuitous; assistance is rendered gladly. On part of clubs some hints seem advisable.

First, a request rather than a demand—like the following—gives less of a shock (necessitating time from which to recover) in the sanctum:

"*Dear Madam*—I ask that those club books be sent *At Once* to ——. "Yours truly,

"—— ——."

Second, the U. S. Post-Office refuses, even to the Woman's Page, free delivery of mail matter sent, even to your Club. Hence, only in accordance with its rates of postage and the editor's stipulation thereof, may expeditious mail service be expected.

Third, if the special theme of the Club's study be mentioned better advice may be given. Work in vocal music is superfluous to clubs whose whole time is devoted to the instrumental.

With July the chair of Woman's Page is to be exchanged for the steamer chair, and no more year-books will be circulated until October the first, yet though farther removed from its many friendly correspondents, their kindly greetings will constantly be borne in mind, and all of interest to clubwomen in Europe's corners visited treasured for them, will be brought back to their columns of THE MUSICIAN. A restful vacation to all club members. S. C. V.

AN ORTHODOX HERETIC.

Her attire was plain—very; in it were Fashion's latest lines, disregarded. One gauged, at a glance, her worldly goods few, as against many "slings of outrage fortune." Yet her countenance was radiant with the delight of hearty enjoyment. "Yes—," and this she actually told me, when De Reszke, as Knight of the Swan, had failed to appear, and Nordica, afflicted with a sudden cold, had been absent. "It was glorious. How fine that music—ah, that inspired music!"

"But," I remonstrated, "the performance was reported not up to the standard."

"Thank goodness; I don't go often enough to know of any standard! Grateful, indeed, am I, that Heaven granted me this one treat. It was my birthday, and a friend, knowing my love, sent the money to be appropriated for music."

"But," I added, "it was in Lent and you so devoted a church woman."

"Yes; long enough had been my fast in music—more than a year—and now God sent me this treat."

Here was heresy to conventional didactics of criticism as well as to churchly rules, yet who can say that her tribute of gratitude did not ascend to Heaven with the efficacy of the widow's mite, and her honest assertion of music's power, unaffected by other's dictates, was not the most orthodox tenet in music's faith, *i. e.*, that amid Life's most arid deserts one draught of music assuages the very thirst of heart and soul.

SONG AMONG THE PEOPLE.

The wife of the director of a Vienna theatre has written under the pseudonym of Richard Norman, a work, entitled "Song Among the People," showing, in six poetic pictures, the development of music and its charm over the spirit of man. She draws a character, Dorisis, a daughter of Heaven, who pleads that the heavenly gift of melody may be sent down upon mankind to make earth's inhabitants good, benevolent and happy. Having secured permission she selects certain choristers who are to act as interpreters of the heavenly message, namely, Ludwig, Wolfgang, Franz, Johann, Sebastian; Richard, of course; Beethoven, Mozart, Schubert, Strauss, Bach and Wagner. The second picture shows David and King Saul with his harp; the third is an episode from lives of early Christians; the fourth from time of Walter von der Vogelweide. The following, from time of Seven Years' War, the two last have especial connection with Vienna's life, Franz Shubert and song and dance. Her mission accomplished, Dorisis returns to Heaven.

Adolph Muller gave musical illustrations at the interpretation of above when the writer received an ovation.

FLOWERS AND SINGERS.

A distinguished physician tells of a famous singer who once received a bouquet of Parma violets; the flower was her favorite and she inhaled a full draught of their fragrance. Shortly after, attempting to sing, she found it impossible—she was voiceless. Christine Nillson tells of an artist, singing in a drawing-room, where the air was redolent with perfume of roses and tube-roses, a few months afterward he lost his voice. Emma Calvé considers the elder dangerous in this respect. The great artist—Faure—who has written a work on the hygiene of song, calls the violet an enemy of the singer, placing it in the same category with use of alcohol and tobacco.

NEWS ABOUT WOMEN.

Ellen Gulbrandson, already known as a Bayreuth singer, takes the part there this year of Brunhilde.

Among the pupils of Madame Marchesi to win distinction during the past season was the American—Miss Ellen Yaw.

Among names brought forward for successor to Pugno, as teacher, when he resigned to give more time to concerts, was a French woman's—Miss Hainl's.

Of interest to all clubwomen was the appearance, in April, of the preliminary catalogue of Mrs. Crosby Brown's collection of musical instruments. In can be obtained, for ten cents, by applying at the Metropolitan Museum of Fine Arts, New York City.

Vienna has, for some time, had its orchestra of women. Recently a quartet of Hungarian women was organized. Four young girls, graduates of the Conservatory of Budapest, formed it thus: Miss Cornelia Bartok-Goldmark (niece of Carl Goldmark); Miss E. Hermann, second violin; Miss Eva Breuer, alto; Miss O. de Horrath, 'cello.

A STUDIO EXPERIENCE.

BERTHA MARTIN.

The solace and pleasure which the greatest philanthropists derive from their work—even Andrew Carnegie, as chief among them, perhaps—is not to be measured by the comfort experienced by a quiet little body whom I know—a pale-faced woman—who knocked gently at my studio door one winter's day. She was dressed in deep mourning. I well knew why. A merry little girl, an only child, who had been the brightest of my pupils, came and went no more. Her illness was a short one, and now the bereaved mother came in at the door through which the little one had so often tripped with her music roll. I wondered at the visit, for a maid had usually accompanied the child, and only once had I met this woman before me, who seemed so greatly changed now that I should scarcely have known her.

In the half-hour, during which her carriage was driven slowly back and forth before my door, her errand was made known. The desolate play-room of her house held a piano, which she desired to tell me, could be used by any child-pupils who had no instrument at home upon which to practice, and payment for the tuition of these children—their selection was left to me—would be also her care. The governess, who had been retained in the house, would arrange the hours, superintend the practice of the children, and attend to the payment of my quarterly tuition statements as I should present them.

When my guest had gone I sat down to think. I surmised, and rightly, that I could soon find six children (to which the number was limited for the present), who would show sufficient ability to learn music, but whose parents were unable to give them this advantage.

Five were presently found, and showed marked interest and talent from the first lesson, and I was casting about for a sixth, but it was not until a few weeks later that one who met requirements were discovered. There had been a severe snow-storm, and a bright-faced urchin appeared at the door with a shovel. The permission I gave him to put my walks in order was evidently joyfully received; he whistled and sang as he worked, and as I went to the door after a time with a pupil, I actually heard him whistling quite accurately the air of a sonata, which the departing student had been playing, the rhythm of the busy shovel marking the effect. When he stood at length surveying his beautifully cleared walks with pride, I called him in, and presently he was seated, rosy and expectant, beside the radiator. I inquired his name, age and address and entered them in my note book, and learned immediately that he loved music. His eyes rested fondly on the piano.

"How would you like to take some lessons, my boy?" I suggested: "You might try, and if you do not care about it, we can stop."

"Me learn to play on the piano!"

"Would you like it?"

His eyes snapped. "*Wouldn't I!*" An idea of tone and accent it is impossible to convey.

Some months have passed, and my six pupils, gathered from various sources, have increased to ten, but their interested patroness assures me that none have been more faithful, nor show greater progress by their practice, than the boy whom I had told her whistled to the rhythm of his snow shovel the air of a sonata heard but once.

There are two worlds—the world we can measure with line and rule, and the world we feel with our hearts and imaginations.

To sing seems a deliverance from bondage. Music expresses that which cannot be said, and which cannot be suppressed.—*Victor Hugo.*

CANON.

By Miss HANNAH SMITH.

THE PUBLIC SCHOOL MUSIC TEACHER OF THE TWENTIETH CENTURY.

HENRY M. BUTLER.

There are music teachers and tune teachers. There are pianists, violinists and vocalists who are engaged in training the ear, voice and mind of the rising generation. Many of the first and second class use their instruments, and some of the last use their voices, as levers and pulleys, to take their pupils to some vague and distant point, the latitude and longtitude of which has never been determined. If the children sing well, if they have learned a certain number of songs and exercises by rote, then the desired goal, in their estimation, has been reached. These are the "tune teachers," whose pupils learn songs and little else. The same kind of instruction in reading would graduate our pupils with more or less ability in the recitation of pieces, but if they were confronted with a new book or a column in the paper, they would be compelled to say "We cannot read, for we do not understand these characters." The "tune teacher" does not teach music, for he has not learned the art of teaching; but he often deceives himself, his pupils and his patrons by having the children sing the tunes by syllables when they have learned them by rote.

Reading music is the ability to think the tones in their various relations of pitch and length, and this ability comes from within, as the result of scientific training. Music problems, like arithmetical ones, must be solved in the mind, and woe to the teacher who thrusts his assistance upon the helpless pupil. The child must think "do-sol" before he can sing it; he must think long and short tones, just as he thinks long and short steps in running and leaping. The music teacher teaches a great deal of music thinking, though he may not teach many songs. His classes may not sing as well as the "tune teacher's," but they are self-reliant and always ready for aggressive work. When they have mastered the most important steps, they are as well grounded in music as they are in numbers and language. A musician has learned to "hear with his eyes and to see with his ears," for he mentally hears the tones as his eyes scan the music page, and he also mentally sees the characters required to represent the tones he hears. Beethoven composed some of his greatest works after he had lost his hearing, for he had not lost his mental conception of tones. The skillful teacher of arithmetic leads his pupils to a thorough mastery of numbers by means of carefully graded problems. The language teacher reads many pretty stories, but the pupil learns to read by going from thing to sign, and sign to thing, until the thing signified is his. School teachers often ask, "How shall we teach singing?" "Just as you teach numbers and language." Music is a science, and it can be taught scientifically. Pedagogical principles apply to music teaching the same as to other branches. The ability to sing and to perform on one or more musical instruments does not constitute a well equipped public school music teacher. Does it require less ability to have charge of the musical training of several thousand boys and girls between the ages of six and eighteen than to be the principal of a school or the teacher of a class?

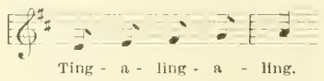
Dr. E. M. Bowman says, "The work of the teacher of music in the Public Schools is the *base course* of the musical monument which is being reared in America. The heighth, stability and beauty of this monument will depend upon the breadth and perfection of workmanship of the elemental builders—the teachers in the Public Schools." This is so, for education begins at the beginning and moves upwards.

Handel and Haydn Societies and Treble-Clef Clubs are useful in adult musical circles, but the soil must be prepared and the plants must be grown between the ages of six and fourteen years. The private music teacher helps on instrumental lines, but the bulk of the vocal part rests with the daily lesson in the public school. If music in America is destined to reach that high point so forcibly foretold by Dr. Bowman, when "the study of music will come to be recognized as one of the fundamentals of education;" if music is to be "the most potent agency available for the development of the emotional nature, and of moral character," and if "the study of music is to take its rightful place in the curriculum of every school, academy, college and University," and if "the time is coming when music will no longer be regarded as an accomplishment but rather as a necessity to the symmetrical education of every American citizen," and if "every child in school is to be taught the same scientifically—that is by note"—then in all candor, what manner of men and women too ought the public school music teachers to be. But in order to make this article of some practical benefit, especially to inexperienced teachers, I will mention some things to be done, and also some to be omitted.

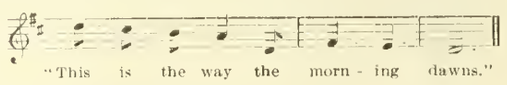
(1) Many good rote songs should be taught, especially in the lower grades. The poetry should always be good, for "Words music hallowed never die."

(2) The line between rote and note work should be well defined. Children can easily learn very difficult music by imitation, but it would be a waste of time in primary work to put such music on the board.

(3) On the other hand, if the practical work has been good, if the children have learned that the tones of the major scale are as real as marbles and pencils, then many practical music lessons can be obtained from the simple phrases of any good song. The following phrase:



Occurs four times in a little sleighing song, and when the pupils have learned this song, if they do not know that the tones for "Ting-a-ling-a ling" are 1, 2, 3, 4, 5, or do, re, mi, fa, sol, then they have not learned to recognize tones, and know very little about the scale. It is not a question of *musical notation* but of *musical perception*, and putting the notes on the board does not reach the difficulty.



Let the children sing "This is the way," to the words, to la, la, or no, no, and when you ask them to raise hands, if they think they know what tones are used for "This is the way," should they fail then the first steps have not been well taken. These phrases are "object lessons" tor the ear, and ear training should precede eye training.

(4) It is an axiom in primary work that "Elementary principles should be learned from objects," and primary children should learn that "notes are things that stand for tones." The teacher's fingers, the buttons on his coat, the stove and pipe, and best of all, a row of boys and girls so arranged that their heads shall represent the ascending scale make good notes. Eight little heads are better than chalk marks on the board; long tones may be indicated by using both hands; a little later five heads may be used, letting the spaces between the heads represent tones. This prepares the way for the staff, and the transition to the chalk staff will be easy and natural.

(5) Music is one of the natural sciences and its elementary principles are as easily comprehended as the problems in numbers. But the thing, music, must come first, and the signs, notes, etc., second. Music is a new thing in the Newport Schools and we are doing primary work in all the grades, for all had to begin at the beginning, but in addition to the regular notation work, we occasionally use a rote song book in the upper grades, learning the songs partly by rote and partly by note. The following is our usual method:

"How many sharps or flats? Where is the right hand one? Where is 1 or do?" A few questions may follow concerning the movement, or any special characters found in the soprano, and then the pupils get the pitch of do and perhaps of the first few notes. I then play the soprano on the violin, telling them to follow the notes so carefully that if I stop playing they can tell the exact place. After reading the words they sing the soprano with the violin, and then they try it without any assistance. In the regular notation work I give them no assistance whatever, nor do I allow any pupil to sing so loud as to become a leader. A few years hence I would not help them on any ordinary piece. Some years ago, I spent an hour with a teacher who sang everything with his pupils, and when several exercises had been sung, he said, "Now let me see if you can't sing the next without my help." The exercise was like this: Do, do | re, re | mi, mi | re— | mi, mi | fa, fa | mi, re | do— ‖, and he sang all except the fourth and eighth measures in spite of his good intentions.

(6) Many teachers seem to think that there is some intrinsic virtue in singing by syllables, and they compel their adult classes even, to sing the old songs to do, re, mi, not even sparing "America." Syllables help to establish relative pitch; they are a means to an end, but it is folly to use them any longer than is absolutely necessary. There are three steps in learning to read music; first, syllables and names; second, la, la—no, no, or any monosyllable; third, the words. The older classes should try the words at once, and failing should try la; if still unable to think the tones, the syllables must then be used as a last resort.

(7) In the best schools, even the teachers of the common branches are required to have some knowledge of a great many subjects. History is blended with geography, and in reading, many collateral subjects are considered. There are many useful and interesting things that come easily and naturally within the scope of the music lesson, and these *side issues* give zest and variety to the work. For example: Children are singing two part music and there are some notes with two stems. Have they learned the term *unison*, and its meaning, *one sound?* When is the tie used and when the slur? Can they describe the notes—the head, stem and hook? Do they know the characters that do not indicate either the length, pitch or force of tone? Have they learned the rule for finding *do* with flats and sharps? Do they know the origin of the syllables, and have they been told about the old Italian Music Master, Guido? Can they give the meaning of scale, major, minor, chromatic, etc., with the most important force and movement words? Have they ever seen a metronome, or the tonic-sol fa modulator? Can they sing the tonic dominant and sub-dominant chords? These and many other important things ought not to be omitted if instruction in music is to keep pace with that in the common branches.

(8) I like to write B.–B.–H.–H.–M.–M.–W. on the board and tell the pupils that these letters stand for seven great composers, and that next week I will see how many have learned their names. Then, from time to time, a word can be dropped about the wonderful boy Mozart, the Blind Handel and the Deaf Beethoven. Neither are such statements and questions as these to be ignored! "There are but two kinds of music, vocal and instrumental; there are only three classes of instruments, wind, string and percussion," and then should follow the naming and describing of some instruments in each class. "Would you rather be a great singer, player or composer?" "What great singers or players have you heard?" Do your pupils know that all the music we now have has been composed since Columbus discovered America? Do they know what harmony, melody, chords, etc., mean, and have they been told that harmony is a modern invention? Do you, dear teacher, use semi-tones for small steps, bar for measure and notes for tones? The stream cannot rise higher than the fountain; *like teacher like pupil.*

(9) Educators make great use of the Art of Composition; children in the primary grade are taught to write the story of the reading lesson; they examine a flower or nest and then write about it. Simple melodies are as easily written as simple sentences, easier in fact, for there are no words to spell, and only ten characters are required. When pupils have learned three tones, it is too much to ask them to write, to compose, to "think out" a little tune? Here are the rules: "Tunes must begin and end with either 1 or 3; they must consist of twelve short tones and two long ones; the tone in the middle and at the end of each tune must be long, and that note—figure or letter—will be followed by a dash. Commas or bars will mark the measures, and a period or double bar, the end." Examples: (A) 1 1, 2 2, 1 2, 3—3 3, 2 2, 3 2, 1—. (B) 1 2, 3 3, 1 3, 2—, 3 2, 1 3, 2 3, 1—. The letter notation should also be used. (C) m m | d d | m d | r— | m m | d d | m r | d— ‖. (D) d m | m d | d d | r— | m d | d m | r m | d— ‖. Most children easily learn to *sing the tune* as they write, but some, the *drags*, the *faitures* in all their studies, will at first make unsingable tunes. The practical side of this is in the singing of these "home-made" tunes. Mary will sing her tune, Charley will sing his, and in a little while individual singing, which is the only test of thoroughness, has been secured. It is possible to construct very pretty melodies with five tones, and this is the second step in composition. I give a few examples: (A) 1 2, 3 3, 1 3, 5—, 5 4, 3 5, 3 2, 1—. (B) 3 3, 5 5, 1 3, 2—3 4, 5 1, 5 4, 3—. (C) s f | m r | d r | m— | s f | m m | d r | d— ‖. (D) d d | s s | s f | m— | m m | d d | d r | m—‖. Some of the best should be put on the board and the "Juvenile Mozarts" should be encouraged to *sing these tunes for mama and the baby.* Sing them three times; first to names (1 2 3), second to syllables, and third to la la, no no, etc. A couplet like "Come, dear children, come and play, For the sun shines bright to-day," will help to make them sound more

tuneful, more like their songs. Hundreds of beautiful melodies are possible with the scale at command: (A) 3 5, 6 5, 3 5, 8 —, 8 7, 6 5, 5 4, 3 —‖. (B) 5 5, 8 8, 1 3, 2—, 3 5, 8 5, 1 2, 3—‖. (C) d m | s d′ | s d | r— | m d | s m | d′ t | d′— . (D) m f | m r | s f | m— | s f | m d′ | s s | d\—‖. The figure and letter notations are easy and simple; the staff notation is complicated and difficult. The orderly process is from the easy to the difficult.

With scarcely an exception, those pupils who are bad in conduct and poor in their lessons are failures in all music work except rote singing. The best in arithmetic, reading and conduct are always best in music.

These *followers* who sing by ear, even when singing syllables, can be helped, but it requires time and patience, and some times heroic treatment.

The concert feature of the average music lessons is its weakest point, and the only way to reach these "weaklings," is to silence the leaders and incite to individual effort.

In conclusion, enough of history, biography, composition and general culture can be included in an eight or twelve years course, to make music mean more than the mere learning of songs and exercises, and although there is a good deal of hard and persistent drill required in getting a musical education, nevertheless, the teacher who cannot occasionally rise higher than notes, clefs, keys, songs and syllables, will not fulfill the requirements of a successful Public School Music Teacher in the Twentieth Century.

THE SONATA-SYMPHONY FORM.

A Lecture delivered before the Metropolitan College of Music.

CHARLES S. SKILTON.

The beginnings of Sonata and Symphony are to be found in the popular dance music of the Middle Ages, in the times when the pied piper lured the children of Hamelin to their destruction, and Hamlet urged Guildenstern to play on the recorder. From the twelfth to the seventeenth century, educated composers gave their entire attention to sacred vocal music, developing the polyphonic masterpieces of the Netherlands school and Palestrina. In the meantime, pipers, fiddlers and minstrels were building up a kind of simple and spontaneous instrumental music with incisive rhythm and pleasing melody, which went hand in hand with the folksong as an expression in art of the life of the people. The village piper often played a series of dances in succession, and when instruments came into general use, educated composers adopted the custom. The dances were idealized and enriched with experience gained in vocal composition, and there resulted on the one hand, the Italian operatic overture, on the other the instrumental suite, perfected by Bach and Händel. The overture consisted of a slow movement between two rapid ones, the suite of a set of dances without much inner connection and in the same key.

The growing demand for instrumental music led composers to seek a form more varied in tonality and dynamic effect than the suite, and yet more capable of unity of style. So the overture was taken apart from the opera and its three divisions broadened into separate movements of serious content. To relieve the earnestness of these and heighten their effect by contrast, a fourth movement in lighter vein was added. In Haydn's time, this was the minuet which he transformed from a stately aristocratic dance to a composition overflowing with popular humor, and which finally became the fiery, impetuous scherzo of Beethoven. Since Beethoven's time the sonata has undergone no essential change. Although in this paper only the term sonata will be used, it must be understood that it applies to many styles of composition. A symphony is a sonata for orchestra, a concerto a sonata for solo instrument with orchestra, an overture a sonata in one movement for orchestra. Many sonatas have been written for solo instrument and piano, many for the organ, while those for small groups of instruments are called octetts, sextetts, quintets, quartets or trios, as the case may be. The sonata for piano is the most accessible to all and will be chiefly considered in this paper. The first movement is sometimes preceded by a slow introduction, as in Beethoven's "Pathetique," Op. 13, but the main body of the movement is rapid and agitated, aiming to arouse intense feeling and create a vivid emotional experience. In many sonatas the deepest ideas of the whole work are to be found in this movement. This is the case in Beethoven's "Pathetique," in his D minor, Op. 31, No. 2, and "Appassionata," Op. 57, with regard to which the composer said when questioned as to their meaning, "Read Shakespeare's 'Tempest.'" The second movement is usually slow and tends to calm the feelings roused by the first, to guide them into more tranquil and spiritual regions, and possibly to prepare them for higher activity. The richness and solemnity of this movement often form the most lasting impression of the entire work. The third movement is usually of lighter content than the others, arousing playful feelings, as a skilful orator seasons his discourse with humorous anecdote, and affords a moment of relaxation before the strain of the brilliant finale. This lighter movement is omitted as inappropriate from sonatas of especially serious content, like the three of Beethoven mentioned before, and from all concertos. In the fourth movement the composer summons all his resources for a powerful, compelling close to his work. It is in the nature of a solution or consummation of all the feelings previously aroused, and therefore seldom of such deep content as the earlier movements, though superficially more brilliant, much as the fifth act of "Antony and Cleopatra" is less intense than the fourth, or the ending of the second act of "Fidelio," less soul-stirring than the dungeon scene where the issue was still in doubt.

While this arrangement of movements is the most usual, there are many departures from it. The order of the second and third is often reversed, some sonatas have only two movements, some begin with a theme and variations, like Beethoven's, Op. 26, and its prototype in A major by Mozart; others end with a fugue, like Mozart's "Jupiter" symphony, Beethoven's Op. 106, and many organ sonatas. Others there are that begin with a fantasie like Beethoven's Op. 27, No. 2, known as the "Moonlight" sonata, and the C minor of Mozart.

An American critic complains of the sonata in a learned and agreeable essay on Chopin, apparently moved by the fact that the sonata was not the form of composition in which Chopin excelled. He says in effect that the sonata is unnatural, that we do not feel excited for ten minutes, then pensive or religious for ten minutes, then playful for five minutes, and impetuous for five more. I should like to invite this critic to sit with me in the Church of the Holy Trinity in Brooklyn, and examine the great window. This window has the color scheme of nature. The prevailing tint of the lower part is green like the grass, of the middle white like the air, of the upper portion blue like the sky. Yet no man can say that it is green for ten feet, then white for ten and blue for ten, the colors are so perfectly blended and so inextricably interwoven. And I would say in passing, that there are few sights so impressive as the fading of those colors on a winter afternoon. The blues are the last to disappear and the figure of the Saviour in that color lingers till it seems suspended in air and is the richest memory that one carries home. As these colors blend, so the movements of a sonata form a perfect picture of the changing moods of human existence. The brilliant allegro has many a note of sadness, the pensive adagio many an outburst of passion or exultation, the playful scherzo tones of sympathy and longing, the impetuous finale moments of rest. Perhaps we shall more readily understand this if we consider the movements of one particular work.

[TO BE CONTINUED.]

THE PRACTICAL MESSAGE OF ART.

FREDRIC W. BURRY.

The casual observer and average diletante patron of art sees something merely to amuse and is (sometimes wilfully) blind to the real work that art displays. Such an one is very fond of extolling the "gifts" of genius, lazily unconscious of the hard labor which must have preceded every production of art. The artist is, first of all, a worker. In fact, the energy that prompts one to create something beautiful is a sufficient proof of his inherent capability for great achievement.

All great works are works of beauty. Art is the crown of excellence. The superficial onlooker imagines that this implies grandeur in the appearance and surroundings of the artist when the latter's life is so often one hard struggle against the most inharmonious conditions.

A glance at the lives of great musicians presents such barrenness of apparent material, conditions which seem so opposed to anything related to art—their own personalities even—in some instances, on the surface not suggestive of anything specially great. But one who can interpret sees beneath all the underlying germs of true art; he knows that the bare and sordid conditions form the necessary negative plane for the masterwork and he can see what is hidden from others—the fire of genius shining from behind the artist's body.

The artist is in the foreground of the race's consciousness; he partly lifts the veil of the Future, though it is true that many fail to see what is disclosed. This is because Art appeals first to the Emotions—to the Intellect only as one in the order of growth becomes capable of interpreting. In Art we shall, in due time, see a glimpse of the real nature of things, so long hidden behind a phantasmagoria of illusions.

The Fine Arts are in their nature linked together. Music, however, may be said to find a special complement in Poetry, since both are preëminently the voice of Language. And I include in the word Poetry the whole realm of real Literature.

We learn first through the senses; our consciousness is, first, one of feeling, afterwards of knowing—and the two conditions are at once the root and apex of our being.

As our existence is made up of experiences, each one constituting a lesson in life's school, and the simplest experiences often proving themselves to be of the greatest importance, so, in the realm of Art, the several small details, the colors, shades, inflexions, the major and minor structures, cadences, chords—the whole heterogeneous mass of material, with distinct marked entities, make up what is really a portrayal of life's action.

As, again, what are called the trifles of life mean so much at times, it is also worth noticing that the masters of art have used the simplest themes, working them out in the simplest of ways, but with what grand results. This is particularly noticeable of Beethoven. This economizing may be said to be the basis of every masterly production, making sufficient use of the subject matter.

The impatience that too often characterizes many musicians prevents such a complete working out. The dashing display of so many piano pieces, with any number of notes and changes, do not evoke any particular emotion beyond sometimes a moment's surprise.

The scarceness of notes in some of the masterpieces of music has been written about before. For it is certainly true that a large number of pieces which are bound to live on are of the simplest character, though possessing a native grandeur which shows itself from beginning to end. At first sight one thinks of the limitations that are here suggested. And they are very real limitations, but by reason of the limits themselves a distant beauty is expressed.

The freedom and expansion that the Fine Arts hint of are at the same time within the range of a certain compass. It is true that they are in their different spheres—portraitures of the underlying real life—but their nature is necessarily bounded by the limits that belong to Expression. Life itself is limitless, yet its various phases of existence are enchained for awhile in limitation; our growth is an evolution from denseness to ethereality. As the race ascends the world's artists give birth to their ideals, which foreshadows a newer and larger life for man.

Even now the Fine Arts are becoming more and more united with ordinary daily affairs. We are learning how intensely solid and practical should be the base of every portrayal of beauty.

In music all hearts are revealed to us.—*J. H. Shorthouse.*

Perfection should be the aim of every true artist.—*Beethoven.*

Every good poem embodies a musical germ—a secret melody.—*Franz.*

Song brings of itself a cheerfulness that wakes the heart to joy.—*Euripides.*

Our chief want in life is somebody who shall make us do what we can.—*Emerson.*

A man only understands that of which he has already the beginnings in himself.—*Amiel.*

The quartette is the refined, intellectual conversation of a small and intimate circle.—*Marx.*

VIOLIN STUDY—SUBTERFUGES, INNOCENT AND OTHERWISE.

GEORGE LEHMANN.

In music, as in the various walks of life, the straight and narrow path is exceedingly difficult to tread. Many enter upon this path strengthened by their own convictions and the promise of virtue's reward, but are lured from it by temptations which point to a road seemingly safe and more inviting; others simply yield to natural inclinations, making no effort to analyze the process by which the few reach their goal, and, content with the semblance of musical virtue, end by deceiving no one but themselves. These two classes of misguided players resort to musical and technical subterfuges of a meretricious character—subterfuges which are designed to conceal numerous shortcomings, but which, closely though they may resemble the real article, rarely succeed in deceiving a listener possessed of knowledge and intelligence.

The Interminable Morendo.

Ole Bull, a gifted but erratic and ill-trained player, practiced many deceptions on his admiring American audiences, but none more successfully than the one of pretending to diminish his tone to such a wonderfully delicate pianissimo that only the most sensitive and acute ear could appreciate its exceptional delicacy and beauty. Often, on a large platform and in the presence of a vast audience, the Norwegian violinist sought to convey the impression that he still continued to draw the bow, when, in reality, he had fully exhausted it and was producing no recognizable tone. As may well be imagined, the majority of his listeners were easily deceived. Physically impossible as it was for them to hear anything, they saw the violinist's attitude, and were thus easily deluded into believing that they also heard an almost imperceptible tone.

It is quite needless to say that such practice deserves the heartiest condemnation, and that it arouses the indignation of every intelligent music-lover. But in every audience there is always a large number of more or less unmusical listeners, and these, easily deceived and ever ready to applaud any seemingly praiseworthy effort, encourage deception in various forms, and lead the player to attempt chicanery on all possible occasions. This is the evil and deplorable result of any form of deception. What in the beginning is hardly more than a weakness deserving of reproach, rapidly develops into studied, deliberate misrepresentation. Thus, in a brief time and almost unconsciously, the player surely contracts the charlatan's incurable disease.

The Stupendous Tone.

It is the ambition of nearly every violinist, nowadays, to acquire an uncommonly large tone. A weak tone, however pure and beautiful in character, generally fails to awaken any enthusiasm; and the player whose tone is not characterized by great breadth and "manliness," may consider himself fortunate indeed if, in the absence of this much-admired quality, his good attributes receive just recognition. But without taking into consideration the fact that all music-lovers admire a large and virile tone, the structural conditions of our concert halls (that is, their almost appalling vastness) hamper greatly a violinist with a weak tone; and through these very conditions there has arisen a practical need for the cultivation of larger tone than was either expected or demanded of violinists in former days.

Now, the acquirement of a large tone is an accomplishment not vouchsafed to the many. The process of developing tone is, it is true, quite generally understood by violinists—that is, its partial development, to speak more correctly, is no mystery to the average player. But who has not had the experience of hearing a feeble tone produced by a man of huge proportions and uncommon physical strength, and an exceptionally large and vibrant tone by a player small in stature and obviously blessed with no great muscular force? Our daily experiences prove, beyond the shadow of a doubt, that superior physical strength is not essential in the acquirement of an exceptionally large and vigorous tone. On the other hand, careful observation has enabled us to learn that, in violin tone, power and charm are chiefly dependent upon individuality, and that a voluminous tone, in particular, is largely the result of a peculiar character of temperament. This conclusion, though not based upon the most accurately scientific principles, explains away the seeming inconsistency of a powerful tone being frequently a product of the physically weak, and a feeble tone the utmost possibility of uncommon muscular strength.

August Wilhelmj, who will always be remembered as a player with a prodigious tone, can hardly be said to deserve all the eulogy that formerly was lavished upon him on both sides of the Atlantic. He was a striking example of physical strength, and the volume of tone which he produced was what one might expect from a man of his gigantic proportions. But there was neither charm nor warmth in Wilhelmj's mighty tone, and it is now quite generally understood that he resorted to illegitimate means in its production. To this day, perhaps, many of his admirers believe that his strength of tone, in its entire fulness, was due to a peculiar temperament and an uncommon physique; but to all those who heard him frequently and closely observed his methods, the enigma of his tone was solved, and his subterfuges became transparent. Wilhelmj easily increased his naturally large tone by adopting methods of phrasing which are decidedly illegitimate. Ignoring the composer's injunctions, as well as all accepted ideas of how a composition should be phrased, he steadfastly devoted himself to the purpose of producing a phenomenal tone. A measure which called for but one bow, he mutilated so cunningly that the ordinary listener failed to hear and perceive that several long sweeps of the bow had been employed. Wilhelmj thus destroyed the original musical intention, always sacrificing the artistic in order to astound his unsophisticated listeners. Such a subterfuge cannot long remain undiscovered, and it is only natural that many who began with admiring Wilhelmj's ponderous tone, ended with contemptuous pity for this gifted but misguided player.

Caprice of Memory.

Every artist suffers, at one time or another, from a caprice of memory which suddenly, unexpectedly leaves the mind a perfect blank. Fortunately, this strange and unaccountable mental state is usually of brief duration; but while it lasts the player generally suffers unutterable agony. This "accident" is rarely preceded by any warning or misgiving: it comes upon the player like a thunderbolt from out of a clear sky.

The writer attended a concert, many years ago, at which such a thunderbolt hit the genial artist, Emile Sauret. The audience was deep in the enjoyment of the French violinist's performance, when, without the slightest warning, "something happened." Just what had actually occurred was by no means clear to the majority of the audience; but Sauret was seen frantically to struggle with the E-string peg which, apparently, had slipped from its usually secure position. The orchestra stopped playing, Sauret tuned his violin, and in another moment the clever Frenchman had resumed his performance of the concerto. His presence of mind had enabled him to convert a caprice of memory into the semblance of a real accident—a subterfuge which, under the circumstances, was not only pardonable but even deserving of some admiration.

On another occasion not so very long ago, the writer was present when Remenyi resorted to a characteristic but less clever subterfuge. He had played but a few measures of Ernst's 'Otello Fantasie," when an "accident" caused him suddenly to discontinue the performance. Glancing reproachfully at his accompanist, he muttered a few unintelligible words and violently mopped his brow. Then he turned to his audience and besought the services of a piano tuner. A mender of pianos quickly made his way to the platform, received whispered instructions from the eccentric violinist, and proceeded to manipulate the pedals of the pianoforte. Discovering nothing wrong with the pedals, he made his escape as speedily as possible; and Remenyi, pretending to be satisfied with the "improved" condition of the piano, began once more his interrupted solo.

Subterfuges in General.

It will thus be seen that there are innocent, justifiable subterfuges as well as reprehensible ones. The latter, however, prevail, and often are a true index to the character of the player. The writer could enumerate an almost endless variety of subterfuges, innocent and otherwise, if space permitted him to do so; but his object, after all, is not to reveal possibilities, but rather to warn the player against all subterfuges that may be practiced with the deliberate intention of veiling inefficiency.

We wait and ask for precedent. If the earth had waited for a precedent, it would never have turned on its axis.—*Maria Mitchell.*

THE DIPLOMATIC TEACHER.

MAUDE MERRILL.

Why some teachers succeed while others equally gifted, industrious and painstaking fall behind and disappear from the ranks, is a problem which has received considerable thought and attention. There are progressive theories in these days and among them is the solution constantly advanced by writers of this Success and Failure question. According to these the succesful one along whatever line of endeavor in every instance owes his achievements to an innate endowment which, for a time, was defined to the still wondering and uninitiated reader as *temperament*, but which, we are told in later and yet more occult rendering, is "personal magnetism."

Having thought much upon the subject and observed constantly, putting philosophy and theory aside, we have reached a decided conviction that magnetism is but another term for tact, and that the latter has for its synonyms wisdom, diplomacy.

At the beginning of last season two teachers were occupying studios in a prominent part of their city, and entered upon their work almost entirely unknown and without influential friends or patrons. One was of pleasing appearance, a fine instrumentalist, the other somewhat lacking in these respects, yet both were gifted, earnest, conscientious. Though it may be the outcome of the fit survival, only closest scrutiny of the ways and methods of these teachers could reveal why, after discouragements and untold struggles of its erstwhile occupant, one studio is at present vacant, while the applicant for pupils, who had seemed least gifted, rejoices in a fair-sized class.

A musician, in speaking of the incident, remarked: "I have noticed something of the same outcome in various cases. Prof. M. was *undiplomatic*. He held hobbies, one alone of which would account for his losing pupils. There was no recognition of the pupil's individuality. It was all Prof. M., his wishes, his ideas, his methods, *par excellence*. I know of a pupil who was studying only to please her parents, whom he kept on technic during the whole of her time with him. Others, who might have accomplished something in light music, were dosed with the Bach "Inventions" against their constant protests. The sound of a street piano playing ragtime drew a pupil from her Bach to the window and, because of her unconcealed pleasure in the music, his sarcasm knew no bounds! Now, his rival, who has retained a studio and his pupils, would have laughed off the matter and, mind you, his inward determination to raise the young lady's standard of taste continually higher, would have been unspoken! Moreover, to accomplish it he would, perhaps, have given her then and there a "Two-Step," but if possible of a grade beyond "Whistling Rufus."

Here was a vast deal of light thrown upon the matter. This diplomacy advocated by the musician was far from the intrigue or stratagem with which the word is often associated. It is because of a lower order of it, or because of a total lack of it, that collapse often follows a seeming success. Paderewski manifests this gift from the very arrangement of his hair, even to his subtle rendering of the Menuet, which brings his audiences to their feet in ecstacies of applause. For it is a gift, and one which gauges the success of the teacher of music in an exact manner of which he himself, it may be, is least conscious. It is manifest in his dress, his carriage, his manner, his words, in the very arrangement of his studio.

With the teacher whose class, whose standing in his community, shows each year a steady gain, the exertion of this magnetic diplomacy, either conscious or unconscious, is constant. In its higher quality it is the essence of tact, with the added ingredients of culture, nobility, intelligence. It means work; one cannot associate it with idleness; it means determination and wisely-directed endeavor.

VOICING OF AN ORGAN.

God is its author, and not man; he laid
The keynote of all harmonies; he planned
All perfect combinations, and he made
Us so that we might hear and understand.

Talent forms itself in the silence of the study, character in the stream of the great world.—*Goethe.*

"Envy is the base admission of self-inferiority."

MUSIC.

There have been men who, spending all their days
Close to the heart of Nature, never felt
One beat and never heard one syllable.
Nor else in the more intimate and harsh
Societies of cities, men engrossed
In the mad chase of cheap authority,
Hear nothing but the strident choruses
Applausive and complaining of their kind,
While near and wooing fellowship with them
Divinest Music sings her world unheeded.
What fled the cunning of the tongue of man
Deep in the being of the speechless world
Now lives. These lips of Music cannot ope
But in her voice you hear articulate
The talk of bloom and the sweet birthday joy
As when white lilies hold all passionless
Their petals pure above the busy earth.
Nor have I lived in vain who once have heard
The record of her thought upon mankind
Whether she pays through Bach, her first high priest,
Her tribute to the intricate designs
Of mind, weaving elaborate in dumbers
Philosophy, as once Pythagoras;
Or when the endless gayety of Mozart—
Still priest because so perfect poised in grace—
Looks the full cup of life in its red eye,
And bravely dares to toss it merrily off;
Or when great conflict filling Beethoven
Bursts into scenes of tragic triumph free,
Touched with his fire or rebel Titan rage
And stands in spirit stature tall above
The hills the panting Jove upheaved to quell;
Or when the one great passion, peering gods
With men and men with gods, breaks all confine
And makes the human heart a trembling lyre
And the god-heart an organ wherein quakes
The ecstasy and newness of desire—
As Wagner tells in his wild, splendid cries—
Ah, surely they have missed the infinite
And shoreless mystery of their own lives
Who never knew a woe or joy so great
As vehemently urged them forth to shout
The charged heart empty to the quiet world.
Interpreter of universal life,
The soul's and body's beauty and desire
Suddenly wed beyond oblivious touch
Is she, the speaking word of speechless life.

Buffalo, N. Y. —*Philip Becker Goetz.*

NARROWNESS OF VIEW.

C. FRED. KENYON.

It is astonishing to what a large extent our personal tastes and prejudices govern our judgments of the works of the great composers. While I may have the deepest reverence for a certain work, you, probably, cordially detest it, and *vice versa*. We all know how Mendelssohn quite failed to appreciate Berlioz and Schumann; how Rubinstein hated the very name of Wagner; and how Liszt was prejudiced against Brahms; but these examples among the famous composers only give a slight indication of the extraordinary diversity of opinion which exists among those who do not claim to possess any special knowledge of the Divine Art. For instance, how we all quarrel about Mendelssohn! The critics of the Old School all claim that he was a Heaven-sent genius of the first order; whilst all, or nearly all, our younger men are unanimous in asserting that he cannot even be put in the second rank of composers.

There are those, too, who shrug their shoulders at the mere mention of Verdi, and those who seek to escape from the presence of Liszt, Meyerbeer, Grieg, Dvorak, Gounod, etc., etc. And why? Simply and solely because we allow our personal likes and dislikes to dominate us to such an extent that we are quite unable to appreciate that which does not directly appeal to our own temperaments. It does not require much thought to convince us that this state of affairs is highly undesirable; the more we exclude from our attention that which fails to arouse our immediate interest, the more shall we narrow and stultify our minds and emotions.

The same fault may be detected in those occupied with literature and art, and instead of being condemned it is more often openly encouraged. Too much breadth of view is objected to as indicating lack of critical perception; but the emptiness of that contention is at once seen when we remind ourselves that they who bring it forward do not condemn merely those composers, writers and artists who produce work that is obviously worthless, but also those who are undoubtedly great. I do not advocate a general enthusiasm and gush over *everything* that is composed, but I do say that it is our duty to train ourselves to understand and appreciate music which, in thought and feeling, is antipathetic to our natures. Narrowness of view, and ignorant prejudice do more to retard the development of music than anything else.

Specialization of knowledge is carried too far nowadays—so far, indeed, that it has spread to the world of the emotions, and a man will deliberately cultivate one side of his emotional nature at the expense of the other. Hence it comes about that all our great pianists perform very limited *répertoires*—that is to say, they are only able to interpret the compositions of a few composers really well; the rest they play indifferently. Thus, for instance, de Pachman plays Chopin and nothing else; d'Albert, Beethoven; Rosenthal, Liszt. It is only a very small number of pianists who have succeeded in cultivating opposite and antagonistic emotions simultaneously; but they have reaped their reward. The great pianist is he who can throw his personality into the temperament of a musician essentially opposite to his own, and interpret his works as though he himself had composed them. The executive musician is of little use unless he possesses an elastic temperament; no amount of musical knowledge and digital dexterity will keep him from failure if he have not a responsive and sympathetic heart.

It is often stated that an executive musician is in danger of losing the little originality that he may possess, if he tries to broaden his outlook on Life and Art; if this be the case, one can only answer that that kind of originality is not worth having, and that the sooner a pianist gets rid of it the better. Peculiarity and eccentricity should not be mistaken for originality; the former are merely surface defects which should be treated as such; the latter is a great gift which permeates the very soul, and adds life and freshness to that which is old and stale. Conductors are less than nothing if they have not a Shakespearean breadth of view which embraces not only those who appeal directly to their temperaments, but also those who are, in nature and temperament, diametrically opposite.

This narrowness of view could be tolerated with more patience if it were not for the fact that it is deliberately cultivated. It is thought by many musicians that narrowness necessarily means intensity, and it is therefore energetically sought after; but surely it only requires a little thought to convince us that this is quite a false position. The more a man's mind broadens, the better work will he do. That is a plain fact, the truth of which may be proved by each of us as individuals. Let me then, in conclusion, urge upon all my readers to let no opportunity pass for obtaining a wider and more accurate view of Life and Art than they possess at present; for until we make ourselves fit to understand Art, we may be sure that music will never reach its highest state of development.—*Music (London)*.

THE SOCIOLOGY OF MUSIC.

LOUIS ARTHUR RUSSELL.

If, with the celebrated French philosopher, we believe that the supreme aim of art as of morals is to raise the individual out of himself and to identify him with his race, we will come readily to the conclusion that music is the fulfilment of the arts, reaching this ideal more surely than the other arts. Music in its very nature, is the heritage of all humanity, and in some form, lower or higher, we find it in the social activities of all people, even the most savage. It is in its essence an abstract art compared with the tangible surroundings of man. Unlike all other manifestations of art, it is not a symbol or a representation of material things, which in the loftiest moments can only suggest the abstract; nor is it an expression of concrete ideas in the sense of poetry's expression. It is a positive, self-existing agency of the spirit, representing material ideas only in a reflective, abstract way, or indirectly by the aid of association with other matter.

As a concrete expression, music is capable of only one quality, intensity, and through this element it finds its great emotional character. In this abstract quality of music it finds its greatest force as a sociological factor, for society is held together in sympathy more by abstract ideas than by concrete details. Men live for the love within a principle rather than for a principle.

Perhaps it is because music does not dogmatize that it is so universally loved. A pictured saint may offend the sensibility of a critical observer, because of its concrete expression, in which he finds no correspondence with his own ideal, and at its best a sculptured Orpheus will not arouse much emotion; but we are melted by a melody which breathes a prayer before the saintly face, or which reflects the anguish of the mythical singer upon the loss of his Eurydice. Crowds will gather and remain where the strains of music may reach them, and a public concert will attract thousands where the display of sculpture or painting would draw but few.

Music is the most sociological of the arts, because it lends itself so readily to our spirits in any mood.

Every general knows how inspiring is music to his marching army. Luther realized the drawing force of music in which all could join, and he, with his stately chorals, sang the Reformation into the hearts of all Germany. The schools drill the scholars in gymnastics and marching, alongside rhythmic strains. The churches all call in the aid of music, not only to attract the congregation, but as a real service glorifying the Creator. Which other of the arts has grown to be so active in society?

I submit to you this thought: Music as it is at present considered in society is in no adequate sense fulfilling its purpose in the world. For you and me there comes a question of deep import: Is music receiving proper consideration as a sociological force? Are we awake to an appreciation of the utility of the beautiful, as shown in this art? Look at the practical side of it; consider the amount of money spent annually for this, shall I say, amusement? Do we seek this art rightly? Are we receiving its full benediction? These questions appear to me pertinent to-night.

I believe that the great mass of cultured men look upon music as a toy, or at least a mere source of amusement. If this be all one can find in music, it is a costly thing, not in any sense paying for the investment. The business man pays large sums for pianos and piano instruction in his household, but he seldom realizes the benefit he should, because he asks for cheap results instead of the best possible. The demand in the home to-day is not for the best in music, but, I regret to say, the worst, the so-called popular song.

In our public schools there is constantly going on a contest, incited by the book publishers, as to the best method of teaching do-re-mi, and while this is going on, to the final benefit of the publishers only, the school children are losing their sweetest privilege, the refining influences of music as a beautiful thing, to be expressed in a beautiful way. If we taught the children melodies associated with the text of the purest theme and expression, we would be doing a lasting beneficence in the community. This offers less chance for the politician, but it will make far better citizens in the coming years. Teachers should have musical voices, and children should be taught to speak musically.

When business men call upon music to aid them in their efforts to amuse the poor during the nights of the heated term, they usually miss the best of the opportunity, for, instead of music, beautiful and elevating, the programs are made up of the most vulgar of tunes, and, as if to flaunt the inappropriateness more boldly, the newspapers or enterprising advertisers print the programs with the subjects of the horrible songs to be played. The excuse for this is that the people want the popular things. If these popular concerts for the poor are to be a benefit to the listeners, those in charge should see to it that good music, clean of vulgar associations, be played, so that it shall become popular.

Let the people be given *what they need*, not what they want.

Look at the churches which spend so much for music.

In the Catholic church, that sublime recital of faith and of the life and death of Jesus is often set to tunes only fit for the dance room. In the Protestant church the Sunday-schools, which should train their scholars in dignified song, with religious spirit, feeds the youthful mind with sentimental lyrics set to trashy, musical commonplaces, polkas and waltzes in disguise. The revival services call for the cheapest music.

Look at the public schools. Ask your child at home to sing you a song. Will she sing you a fragrant flower of music, such as should have been learned in school? No! She will pick up a coon song from the piano, the only thing she knows in song. And, gentlemen, I believe you are pleased with it. Is not this a shame?

If music be but a toy, cast it out of the church and the school. Put it in the nursery, the dance hall, or on the park platforms alongside Punch and Judy shows. But if this sublime heritage of man be what so many of us think of it, let us see to it that, though we find it a thing of play in certain moments, we recognize, in so great a thing, something to be held in deep reverence, as we search for its full meaning.

THE VOICE

MR. FRANK HERBERT TUBBS, Associate Editor.

With this issue we begin a series of answers to inquiries. We have been running a series of articles of a pedagogic nature from which material for study has been derived. Now we purpose giving a very practical trend to this department by answering questions sent us by teachers and students. This first instalment shows the helpful character of this department. We will welcome inquiries from all who desire help.—Editor of THE MUSICIAN.

INQUIRERS' DEPARTMENT.

FRANK H. TUBBS.

Is the quaver in the voice which some people have, right? How can I acquire it, if I ought to have it?

In a perfectly cultivated voice there is a vibration which might be termed a quaver, which is beautiful and much to be desired. The explanation which that clever teacher, Lyman W. Wheeler, once made was, "When the tone is perfectly vibrated at the vocal chords, the sound is sent out of the mouth so rapidly that one sound-wave impinges upon the one in front of it, pushing it faster and faster. This pushing and consequent resistance causes vibration, which never leaves correct pitch, and which gives 'bloom' to the voice." In the years of experience since he gave that hint, nothing has come to light which better explains the "bloom" in the voice.

It will be seen at once that this kind of quaver is the result of perfect action, and it is a result. Impatient students wish to have it quickly, without going through the process of training which should lead up to it, with the effect that they add "tremolo" to the voice. That is about as bad a habit as one can fall into. Unfortunately, many teachers train pupils to use tremolo. Of course, such a teacher is ignorant and is not a safe teacher. The habit of tremolo can be gotten rid of, but it is too bad to be obliged to undo wrong work. It is very probable that the inquirer has heard this tremolo used and thinks it ought to be obtained. Do not do it. The voice with a tremolo is badly used. Then, should one seek the beautiful vibration which Mr. Wheeler explained? Yes, but not directly. Let it come into the voice with the perfect use of the vocal organs. Train them and the "bloom" will appear. Hastening the desired vibration will only produce an artificial tone, which cannot bear hard work and the voice, when one gets into public singing, cannot hold its own. It is better to wait and do things correctly and in the right way.

The tremolo is different from the vibration in one important particular: The first wobbles from the key; the second is true to pitch. Sometimes students who have been taught to use the tremolo, get so they strike three different notes in trying to sing a tone. The note they aim at, the one above and the one below. This is distressing to musicians, of course, and must be so to any cultured person.

●

When I sing songs I find I am pressing in hard on the diaphragm: Should I stop that?

There is no reason why one should use the diaphragm differently when singing songs from what he does at other times. If there is pressure during song singing, it should be stopped. Return at once to physical culture which bears upon breath control. Many singers think they have the diaphragm trained to do its proper work when they have not. They get so they can sustain pretty well on tones and simple exercises, but that training is not enough to do the tone work in songs. There are many disturbing elements in songs. The changes of pitch require large movements of the larynx; the words make the tongue and jaw change; expression calls for large physical work. All these have influence upon the diaphragm, but as they are essentials to singing, we must get so we can do them and not move the diaphragm. That point is lost sight of. Singers may feel certain that if anything about the voice goes wrong, no matter to what they may attribute the cause, the real cause is in the breathing. Return, then, at once to the study of breath control. This should be a practice separate from singing and should be done without use of the voice.

This matter is so important that time must be given it every day. Even one day of neglect will be noticed by the student, and a week of neglect will do so much harm that the public will notice it. The best practice is that of whispering words, controlling the escape of breath perfectly. Whisper from a book. Do not try to recite from memory, for the mind is taken up with calling upon memory. During this practice the mind must be directed to conserving the breath, and it must be strongly concentrated on that. Side-thoughts may go elsewhere, but the concentration of thought must be on breath control. Then, as said, read from a book. Read two or three words and pause, holding the breath. Then read again, pause again, read again. Continue this process as long as the breath can be held. Then after a moment of pause, repeat the operation. One should give at least fifteen minutes to such practice every day, and he should never skip a day. When one is walking on the street, or is standing for a moment waiting for something, he should hold the breath, controlling, not at the throat but with the diaphragm. It is a good drill to lift some heavy object with the breath held, and that by the diaphragm. The question to be in mind is, "Am I perfectly holding the breath with the diaphragm?"

Now, if one does enough of this training he will not be disturbed when he sings a song. He will not press in hard on the diaphragm. He will not press anywhere. Any physical sensation has bad effect on the voice, and whatever causes such must have attention. Pressure on the diaphragm or anywhere else must be stopped.

●

My singing makes me cough; is there a remedy?

The remedy lies in gentle and continued practice. While there may be physical trouble in the throat, it is probable that coughing, when one tries to sing, arises from irritation in the throat from imperfect action. We cannot expect that young, tender and unused muscles and mucous membrane will go to work and be perfect right away. They must gather their strength. Give them time and make practice more gentle. If there is physical trouble, it is most likely that the uvula—that little pendant which hangs down from the roof of the mouth—is too long. If it rests upon the tongue or hangs down the throat, it is too long. In that case one should see a physician for treatment. But, remember this, do not let the doctor cut off the end of the uvula unless it has been "too long," for at least five years. Doctors are very ready to cut. In the majority of cases they don't need to. There should be treatment which takes the form of astringent applications for some time in the expectation that the elongation will be remedied. After proper trial of that, if no help has come, the trouble should be removed by the physician's shears.

A case which has had special interest lately, and which shows the liability to mistake which the physician may make, is as follows: A lady has been troubled with hoarseness. The doctor said that one of the vocal bands was much relaxed. The speaking voice was rough and at unnaturally low pitch. When singing to high tones the voice would stop entirely. But even with these conditions the teacher saw that the trouble was not with the vocal chords at all. The habit into which the singer had fallen with regard to way of taking breath and pressing by the strong waist muscles against the throat, was the real cause of the trouble. The larynx could not take care of all the breath thrown upon it and, because it overworked in its endeavor to do so, it became inflamed. In less than a half hour of correct drill the tones became pure and sweet, the speech resumed its normal pitch and the upper voice could be used with freedom. It was much better to have that half hour of drill with the singing teacher, learning by actual evidence how to avoid similar trouble, than it would be to visit the doctor several times, and, at most, secure only temporary relief.

This case can be cited to show that the cause of a cough may not lie in the throat, or where there is evidence of irritation. The cough may arise from imperfect and wrong action at some part far removed from the throat. The remedy lies in removing the cause. Any amount of local treatment, even if it does remove the cough, is not worth much unless the cause is reached. The vocal teacher is the better doctor in such cases.

●

You say the tenor voice does not employ head-tones; are not those placed in the same manner with men as with women? Are they not as difficult to reach?

The real head tones are made by vibration of the forward parts only of the vocal chords. The rear half is not vibrating when head-notes are made. The power which shuts off the rear part lies in two small cartilages which run out into the vocal bands themselves. (Cartilages of Sautorini.) Now, these cartilages are not present in the male larynx, except in a few cases. They are the exception to the rule. If absent, there can be no head-notes. That is why men cannot sing real head-notes.

But, such is the misunderstanding in nomenclature, the majority of teachers do not apply the term "head-voice," in its correct scientific way. They call all soft notes in the upper voice, "head-tones." Of course, these can be made by men as well as by women. Probably that is what the questioner had in mind. These soft notes should be placed in men's voices in just the same way that they are in women's voices, and they are as difficult to reach. The question only needs the explanation of how *real* head-voice is made to clear the mind of the questioner. Let us continue this one step more. Many teachers deem it wise to coax the soft voice into use in the early days of vocal training and then carry this soft singing downward through the whole voice. It is a wise proceeding and, while it prohibits for a time the use of robust tones, it gives the deliciously sweet singing, which alas! is so seldom heard at present. Teachers who study the dispositions of their pupils will find one now and then who is willing to dispense with noise and enjoy quality. With such pupil, coaxing out the sweet so-called head-voice and extending it through the whole voice will produce a singer who will be admired and enjoyed. It will probably be hard to keep him from wanting to burst into a yell, but if he can be held down until the beautiful soft voice is at his command, you will produce a most satisfactory singer. As he finds that voice appreciated by cultured people, he will be satisfied with what has been done for him.

●

At how early age is it advisable to begin cultivation of the voice?

This question comes up often. In answer for the public, there are many things to be taken into account. In any individual case, it is easy to decide. One can judge whether an individual is ready to begin or not. It is not so easy to give rules which apply generally. This is certain: When the change of voice has taken place, the youth is ready to begin serious vocal study. That is true in all cases. The boy's voice generally changes when he is from fourteen to sixteen years old. It takes a year to settle the voice, and as soon as it is settled, training may begin. Girls reach the change of voice earlier as a rule. From twelve to fourteen is the age of change. Their voices settle more quickly. Young ladies are almost always ready for vocal training by the time they are fifteen years old.

This may be taken into account: The voice soon after the change is lower in pitch than it will afterward be. Many young men who have tenor voices are supposed to be baritones, because they cannot sing high. If one can sing as high as E or F soon after the change of voice, it is quite probable that the voice is tenor, and with training and maturity the upper voice will come. There is not so marked a difference with girls. The soprano voice will show early.

It is more a question of policy than of principle whether the voice of the boy or girl should be cultivated before change of voice. Most children can be trained to do good singing, and the education in music can be furthered by training the child's voice. How young children should be taught is then the question. They can begin very young if they are to be trained. As early as eight years of age. Of course, music which they can sing easily must be chosen, and it must be such as is not deeply emotional. Such expression as would come from a mature person must not be expected of them, nor is it to be required of them. More than that, it would be wrong to demand deep emotion. To arouse the intense feeling which an adult can have in the mind of the child is harmful to his nature. We want symmetrical minds. If a child developes passionate expression which is beyond his years to feel, it

is one-sided expansion. It will wear him out and he will be too old for his years. Any one-sided mental growth is sure to react on the physical parts. In this lies one reason why it is a matter of policy whether the child's voice should or should not be trained. If the teacher will use the right music and train only so far as is needed to render that, music training may begin at any time after the child is eight years old.

●

How would you train a singer whose voice is out of tune?

This refers, judging from its context, to those unfortunate persons who sing off the key. Many say that one who sings false can never be made to sing right, and they are often advised not to try to learn to sing. Experience shows that any defect can be overcome. There are two causes of singing false, and the teacher must first decide which of these is causing the trouble. The first and more common is wrong throat action. When this is the case no special attention need be given to the fault, but the teacher should proceed to train the voice and when freedom of larynx is secured faulty intonation will disappear. It often happens that the singer does not know his voice is untrue, and it is just as well not to inform him of it. If he become conscious of the defect he will be liable to perpetuate it. If he never has his attention called to it and the vocal training proceeds on right lines, he grows out of the fault and is never disturbed afterward except he loses possession of his good method of voice culture.

The other cause of the fault arises from wrong mental perception of pitch, commonly called "faulty ear." As said, this cause is less frequent than the other. The remedy lies in ear training. The quickest way out of it is to sound tones with the voice and have the student sound them afterward as quickly as he can catch the pitch. His first attempts may result in failure but do not be discouraged, or even surprised on that account. Be persistent. When he can repeat the single tones sounded, proceed to sound intervals, and have him repeat those. Make long intervals at first. The interval of the fifth is the first one to get. Then, fourths. As these are mastered, use shorter intervals, finally getting down to minor seconds. The student will, in the meantime, be establishing a pretty good method of learning to read music, for he will acquire the habit of perceiving intervals.

After intervals are fixed, use triads and little melodies. When the student can repeat after the teacher melodies as long as phrases of songs, substitute songs. Following this course will enable the student to commit songs to memory. He will quickly acquire the habit of learning songs so he can sing them without his musi .

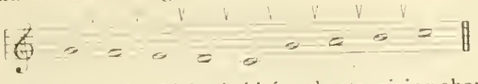
It may take several weeks for one who is deficient in musical ear to get so he can sing perfectly true all the time, but when it is once mastered it is there to stay, and you have added to that life a precious possession. There is nothing more beautiful in the world to give anyone than perfect mastery over his expression of soul, through music. The teacher opens to his pupil a new world—a world of beauty.

●

What exercises can I use for training my chorus?

It is a pleasure to find a choral society director who is willing to train the voices of his choir. Most directors take such material as is presented and let it be used in any way. The result of that is that tone quality is neglected. Any chorus which is trained together in voice culture has that unanimity of action which gives good effect, even if the training is not on the best lines. A choral with forty different methods will not sing well. All tone production should be based on physical drill and the basis of that is in breathing. Show the singers how to breathe and train them how to do it. Naturally one cannot go into the details of breathing as he would with private pupils. Explain that when we inhale there will be expansion of the sides and slight expansion at the abdomen. Have the singers place their hands on their sides and, when they inhale, breathe into their hands. Use this as an exercise: Raise the baton and have the singers inhale; lower the baton and have them exhale. Repeat this four times. If, during a rehearsal the voices seem tired, stop all singing and use this drill. It is remarkable what a change will come to the tone in singing and how long rehearsing can be kept up. If the leader of a choir will do this several times, he can hold a vigorous rehearsal two hours without injuring any voice.

The basis of voice production is the easy emission of tone from an unrestricted larynx on the vowel "Ah." Have the singers sound the tones of the following exercise, being sure that the breath is taken deeply and the tone is sung with freedom:



Each note should be held four beats, giving about one second (or more), to each beat. It is well to watch the quality of tone at the end of each note. If the fourth beat loses character the singers are inattentive and careless. Keep the ending of tones good and the whole tone will be good.

Use the scale as an exercise. Have all sing in concert. Then vary it by having half the chorus sing upward while the other half sings downward. Then have it sung twice in one breath. This exercise has the advantage of making the singers listen to each other and get definite blending.

One may extend exercises if he chooses, but three are enough for all needed purposes. These three will bring uniform tone-production into the choir and that is essential to good singing.

●

Should not the tongue be lowered on low notes? The larynx is lowered and should not the tongue go down also?

At first thought it would seem that the tongue must be lowered with the lower-larynx, but if one can have access to a model or a cut which shows a cross-section drawing of the tongue and larynx, he will see that the length of muscles which run from tongue to the hyoid bone and from that bone to the larynx is so great, and he may know that these muscles are very elastic, that there is sufficient room for all needed depression of the larynx without drawing upon the tongue at all. It is possible to sing the lowest notes and not lower the tongue. Now, is there any advantage in keeping the tongue from lowering? There is this: A limp and free tongue is always a large one and the large tongue is needed for giving resonance body in the mouth On this account it is best to have the tongue high and "fleshy." It is not at all certain that the larynx should lower much even when singing low tones. We know that most singers do lower it, but that proves nothing. Most singers do many wrong things. The lowest notes are made by complete relaxation of the vocal chords, and this looseness is gained more by the opening of the "chink" between the thysoid and the criloid cartileges than by lowering the larynx. If one will feel with the finger just below the projecting point of the Adam's apple, he will be able to detect a little depression. When he sings low that grows larger. If it can grow very large so as to seem as large as the end of the little finger, he has loosened the vocal chords within the larynx very completely. If he gains such opening he will find that he can then sing the low notes and not have the larynx go down much. It is probable that this is the better way of the two to gain low voice. At any rate, better resonance accompanies low tones gained through this means, and when it is used the tongue need not be depressed at all. Of course, this whole matter is too complicated to be made up into exercise for daily use. The above question is answered for information only, and to clear the view of one of our most earnest readers. It was sent in a measure, as criticism on the the teaching of a former lesson. This answer, while it does not complete the subject, is framed to add to the former instruction. The full purport of that is that the tongue, being the visible influence upon the larynx, should be so trained that it never presses upon the larynx. If it keeps away from the larynx (or tone-producer), that organ is at liberty to emit tone with freedom. After all, that is the thing we are all working for. Any device which grants us that freedom should be used, even if at times we may think some action or position of the tongue of a special nature might with reason be used. Rest assured, if the tongue follows the larynx downward, it stands ready to push upon the larynx and make "growling" low notes.

"THE DIAPHRAGM."

BESSIE C. WRIGHT.

"The diaphragm is the seat of the soul," so said the old philosopher. Since it is the *expression of the soul* that we are now studying (for you will remember that we have learned that "voice is the expression of the soul by means of the body"), we must learn to get at the "seat" of the soul.

"From within, outward," is a motto in voice culture as well as in other studies. The feeling is within, the giving of it to others is by putting it out in the voices. The tone begins within, and is developed outward.

The diaphragm is undoubtedly the great aid in singing. It controls the breath and hence controls the tone. It is sympathetic with the muscles of the throat, so if you will loosen the diaphragm, you can keep the throat loose. If you laugh, it is with the diaphragm, if you cry you sob with the diaphragm, if you are frightened the diaphragm becomes stiff and ungovernable, if you are disappointed the diaphragm drops lifeless, and if you are cold you shiver at the diaphragm. When you are tired, notice how the diaphragm sinks, and when you are well and vigorous, notice the hardness and strength of the diaphragm. Perhaps you have never thought of this before. Many have come to me for lessons, and were almost ignorant of the fact that they possessed a diaphragm. Certainly they have never thought of the real importance of this great, flabby muscle Nervous people would also do well to gain control of this muscle. Strength and flexibility of the diaphragm are requisites for good breathing and singing, hence we must use exercises to that end. In a former lesson I have given two exercises for this practice which are now followed with others.

Ex. I. Open the mouth, and drop the tongue loosely, as does an animal in panting, and pant as nearly like a dog as you can. This you will find consists of very rapid, short breaths, with distinct outward and inward movements at the diaphragm with every inspiration and expiration. Begin the panting with the outward movement or the "taking in" of the breath.

Ex II. On a slow minor scale sing "e-e-each," on each tone, with a distinct outward throb at the diaphragm, on each syllable. With practice, increase the rapidity of the throbs, until the exercise is merely a shake of the diaphragm on each tone of the scale, saying the word "each." Also use the word "e-ve-ry" in the same manner.

Ex III. After the "shake" of the diaphragm has been acquired, by practice of the preceding exercises, sing "Boat Ahoy!" with a prolonged, heavy shake of the diaphragm on the last syllable—"hoy." The first two syllables are to be sung on a low tone, but the last in the octave above.

A smooth shake or tremolo at the diaphragm can only be gained by long practice, so the pupil should not be discouraged with results, in the beginning. They must, however, be extremely careful lest they should mistake the use of the throat for the diaphragm, thus producing a martellato instead of the tremolo. I hardly need say, I think, that a constant tremolo in the voice is very much out of taste, and serves only to remind an audience of one afflicted with palsy, but the flexibility gained by the diaphragm in this exercise is absolutely indispensable to a good singer. It is also needed in emotional singing.—*The Period.*

OPERATIC ARIAS.

O Mio Fernando. La Favorita di Donizetti.

W. LOWES-HEATH.

In taking any operatic aria as a study great care should be exercised, and more especially by the teacher. The majority of arias have a more decided individuality than songs, so much so that they often take complete possession of the voice and singer, frequently causing the voice to reveal a capacity unsuspected before. The result of this is good or bad, according to the wisdom with which the aria has been selected, and according to the student's control of the voice.

If the latter be sufficiently under control and the selection well made, all demands of the aria which the voice strives to meet will result in development and progress, for the intelligence of the student will be quick to understand and second the efforts which the voice seems at first to make of its own accord, or will, on the other hand, quickly realize that the voice is making an effort on lines not suited to its character, in which case it can be controlled betimes.

An aria, like "O Mio Fernando," may not be taken up lightly and cannot be studied with impunity. Its capacity to benefit or harm is great, and if a contralto, whose voice is naturally adapted to such work as the Page's Song from "Les Huguenots," takes up this aria and allows it to dominate her voice, as it will do if not most carefully handled, she will find in a short time that the voice will seem to have lost its natural agility and lightness of tone, and may consider herself fortunate if she escapes a "complete rest" and a return to pianissimo work and the rudiments of tone production before she can recover the lost ground.

"O Mio Fernando" in the first part demands a broad, full tone quality, both of chest and head, and requires that this breadth and fulness be sustained for over a page and a half of largo singing, during which a full heart gives expression to a great love, while a deep tone of sadness underlies the whole, caused by the fear that the event may yet rob it of the love and the beloved.

In the second part there is a radical change in the sentiment and spirit of the music. The fullness of tone is still necessary, but it is dramatic and passionate, and there is a cry of despair and rebellion against the injustice of fate. Yet it is still sustained and demands ringing, full-bodied head tones, and although it should seem to be comparatively short, being generally cut one-half, still the voice is kept working at almost full power during the whole movement, with little or no opportunity of rest.

The aria is full of rich melody of the kind which is very singable, and it is for this very reason that great care must be exercised in its selection and study. Its richness of melody makes an instant appeal which almost any voice in singing it will strive to satisfy. But the voice must be very robust and full and have a very easy production, especially of the head tones, otherwise harm will result.

It is not necessary to study the recitative which precedes the aria, for the reason that it refers more to the preceding scene rather than to the aria itself.

Leonora loves Fernando and knows herself beloved of him. She is aware also that he does not know that her relation to the king is a dishonorable one, and that she can only bring shame as a dowry to the man she loves and would wed. The king, in revenge for what he considers the deceit of a mistress and the presumption of a subject, determines that they shall be united, and the truth concealed from Fernando until after the ceremony. Fernando is happy; what Leonora's feelings are we learn from the aria.

"O my Fernando, my heart and the throne of the world would I have given to possess thee. But this pure love of mine, all I hope of pardon, alas poor wretch! are alike condemned to shame and despair.

"The truth shall be known, and in the extremity of thy scorn my heaviest punishment I shall find; yet should thy disdain be softened, then I pray the wrath of God may fall and strike down."

This closes the first part and a few phrases of recitative lead us into a second movement.

"Up ye cruel ones; who withholds you? written in heaven is all my pain!"

"My doom of pain stands written above, approach ye all the day is festal; let the altar be crowned with flowers, the yawning tomb e'en now awaits me."

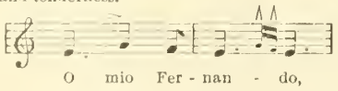
"Let the bride be draped in black, scorned, rejected, in despair, she may not hope in heaven's mercy."

From the above translation the student can get the idea of what tone color to use as a foundation for the interpretation of the aria. The rich note of love is darkened by the sombre shade of sorrow and hopelessness, and through the second part there rings a cry of despair against the injustice and irony of fate.

For the first part the time is largo. The first phrase, "O Mio Fernando," is sung very broadly, with a great depth of tenderness, each tone being sung legato and well sustained into the following, else the significance of the largo will be entirely lost and degenerate into a mere dragging of the time. The voice must therefore be sustained full and even and not be allowed to drop between the notes.

ILLUSTRATION 1.

Breadth and tenderness.



The G is accented and the voice expands on it; the grace notes are slightly accented and must not be sung too quickly.

The phrase, "Della terra il trono," is marked by the same tenderness, breadth and sustained tone. As the phrase mounts it crescendoes and broadens and the C is accented. In descending it diminishes slightly, but the F sharp is accented and the portamento to the G is well marked.

In the phrase, "A possederti, avria donato il cor," the G is accented as before, but the grace notes are sung more lightly; the C receives an accent, and in the following measure the time accent is well marked.

The portamentos should be well studied and sung only where they are marked.

In the phrase, "Ma pure l'amor mio," the three eighth notes should be well marked and the voice

ILLUSTRATION 2.

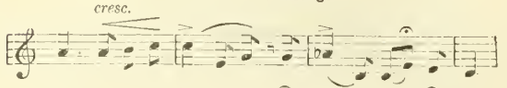
Very sustained with full, free emission of voice but no attempt to sing forte.

crescendoes as the phrase mounts to the C. The crescendo continues through the next phrase, "Come il perdono," in which the D is accented but must not be held.

The next phrase, "Dannato ahi lassa!" is full of bitterness and sorrow. It crescendoes and broadens as it rises to the quarter note on C, which is accented and carried down by a marked portamento.

In the following phrase, "E a disperato orror," the A flat is accented but the voice sinks down almost at once by a sweeping portamento to the two eighth notes on B. These are accented but their time value is somewhat sacrificed to the following E, which is the important note of the phrase. This note is accented and held and the voice expands on it.

ILLUSTRATION 3.



The phrase, "Il ver fia noto," is sung with decision. The second eighth note on C and the first quarter on A being accented.

In the phrase, "E in tuo dispregio estremo," the F is expanded and care must be taken to sing the phrase legato. In these two phrases and the following, "La pena, etc.", the time quickens a little and the tone quality is more dramatic.

The phrase, "Che maggior si de," should be well marked with a rallentando, the B receiving a slight accent and hold.

In the following phrase which modulates into the opening melody, the F should be taken with a clean attack and diminished slightly as the voice proceeds to the run, each note of which should be clearly articulated. The following notes should be sung very deliberately, and the next phrase either commenced or anticipated in the same breath.

In this phrase, "Se il giusto tuo disdegno," the three eighth notes and following quarter are accented, the latter expanding a little. In the portamento, from E to C, the voice again expands and the lower note is given out with the full breadth of the chest tone, the octave note being also accented.

In the following phrase, "Allor allor fia scemo," the voice broadens on the C and in the portamento from F sharp to G.

In the first part of the next phrase, "Piombi gran Dio," the time quickens and the voice comes out full, with dramatic appeal; this is followed by a rallentando passage in which the couplets are accented.

ILLUSTRATION 4.

With great decision.

In the phrase, "La folgor tua su me," the three sixteenth notes are well accented and the F, which is also held. But in coming down from this note there must be no portamento (Fig. 4).

Of the following two phrases the first begins lightly, but expands a little on the F and decreases after, the time also quickens a little but is kept even. In the next there is a crescendo which diminishes as it comes to the A flat, and the accent of this phrase is more marked than the former.

In the final phrase, "La folgor tua su me," there is a decided ritard, each note is well accented, and the chest quality must be made to count in the final hold.

We now come to a few phrases of recitative in which the note is struck for the interpretation of the second movement. It is a note of despair in which the voice comes comes out full, decided and dramatic. The time is quick and the voice is carried along by the movement.

The tied half notes, which are frequent, must be well sustained at full voice, and indeed this entire movement calls for all the power the singer can bring to it, and it is a severe tax on any voice, even the most robust. The head voice is used a great deal but it is pushed almost to the limit.

It is not necessary to treat this movement by phrases, as it is better that the student should grasp the spirit of it as a whole.

There are two phrases, however, which occur twice, and to which attention should be paid. They are "Maledetta" and "Disperata." The first time they are sung piano with a dark, gloomy, covered quality, expanding on the half notes but still retaining the dark quality.

ILLUSTRATION 5.

The second time they are sung forte the voice is not so dark, but the accented notes are full of despair.

For the young student who needs the practice of legato, singing this aria, especially the first part, will be a very good study. The second part is more adapted to impart a dramatic delivery.

THE RIVAL SINGERS.

JULIEN.

A Court concert in Buckingham Palace had been announced. The very cream of the nobility had been invited, and a more brilliant reunion of rank and fashion was seldom seen. Nine o'clock was the hour announced for the concert to begin, but as early as six o'clock the elegant equipages began to arrive, actually pushing their way through the dense crowd of people waiting to get a peep at the aristocracy. Ladies elegantly attired in silks, satins and velvets, alighted from their carriages and hurried forward in order to secure desirable places.

Although the hour for opening the entertainment was late, there was no impatience manifested, for there was plenty of material to talk about to fill up the time completely; that is, the discussion of the merits of the rival singers.

The pet of London, the charming Cuzzoni, was to sing this evening in contest with the celebrated Faustina Bordoni, from Italy. Händel himself was to direct. The Princess of Wales had, immediately after the grand rehearsal, called Händel aside, in order to get his opinion of the new singer. "Does she really sing better than our Cuzzoni?" asked the princess. "Your royal highness," replied Händel, "Cuzzoni sings like —— a woman, Faustina like a —— goddess. The majority, perhaps would prefer the woman to the goddess. They speak of Faustina in Italy as a Diana, but Cuzzoni is really ——." "Stop! Stop, Händel," interrupted the princess, playfully shaking her finger at him. "I will not hear our pet underrated. I know very well though, that you two are not great friends, and that the little one is moody and stubborn, and no one can less endure her freaks than our great Händel. But notwithstanding her faults, she is a charming creature, and when you compare Bordoni to Diana, I must compare Cuzzoni to Venus." "Your royal highness has pronounced a most just verdict on the two singers," said Händel, and so the conversation ended.

Through the personal influence of Händel with the music loving princess, many distinguished musicians and singers had been invited. Among them was Miss Fenton, who had once been considered in London as the "Queen of Singers;" the elegant William Bogie, a great admirer of Händel; the celebrated young singing teacher, Paradisi; the well-known organist, John Robinson; Maurice Green, the fine composer of Church music; the celebrated singer, Lampe, and his charming wife; the great organist of St. Giles Church, Magnus, and many others.

Among those in the orchestra were seated some of the greatest artists of England; such as Churke, the first violinist of Drury Lane; the two Matheis, father and son; the celebrated Mathew Dubourg, etc. It was considered such an honor to play under Händel's direction.

The Höllen musik, as the Germans call the tuning up of the orchestra, was over, and the commanding figure of Händel appeared on the leader's platform. The curtains of the royal box were drawn aside, and the court visible in all its splendor, was tumultuously greeted by the vast audience.

After a short pause, the master gave the signal, and a majestic introduction of the orchestra followed. Then the celebrated tenor, Francesco Bernardi, also known as Senesimo, appeared. He sang the grand aria from Handel's Rhadamist, "Ombra Cara," which no human voice could sing with more pathos and effect. The applause was great, but not as long as usual when this favorite of the people sang. The interest of the audience was centered in the two riva singers. The pause seemed longer than usual, and expectation was on tip toe.

At last the curtains back of the orchestra opened, the rows of musicians separated, and Händel appeared leading the two singers toward the platform. The fairy like figure on the left of the master, with the long powdered curls, was Cuzzoni, the pet of the young bloods of London. She was dressed in rose colored satin, cut as low in the neck as the law would permit. On her head she wore a wreath of red roses. Her arms and neck were ablaze with diamonds.

On the right arm of Händel proudly walked Faustina Bordoni; and she being the stranger, all eyes were fastened upon her. Only Faustina could have been so composed under the trying ordeal. The style of the two singers was so in contrast, that one could not compare them. Cuzzoni was petite and more tempting, enchanting perhaps—but Bordoni was a queen. With a smile she bowed to the greeting she received from the excited assembly, and when, with a deep bow she turned toward the royal box, there ran through the audience a murmur of admiration. Such a distinguished form had never stepped into that concert hall before.

Faustina Bordoni wore a long, flowing, rich dress of satin. A gold cord with heavy tassels encircled her delicate waist. Her glorious hair, whose blackness not even the powder could conceal, was arranged in the style of a Greek goddess, with strings of pearls plaited through it. No ornament decorated her alabaster neck but a simple band of gold encircled each wrist. Her beautifully shaped arms were perfectly bare to the shoulders. Pride sat enthroned on her brow and about her perfect mouth. Her dark eyes wandered quietly over the brilliant assembly, and then turning towards Händel with a slight inclination of the head, the master gave from the piano the signal to begin. The instrument began the introduction, and Faustina Bordoni sang the Aria from Händel's Rinaldo:

"Lascia ch'io pianga
La dura sorte—."

The audience scarcely breathed. Was it the solemn effect of the plaintive melody? Was it the powerful tones of that mighty voice, which filled and flooded every nook of the music hall, and then died away to a mere breath? Was it the nobleness of the delivery, united with the imposing grandeur of her appearance, that threw such a spell over her audience? The impression her singing made was best expressed after the last note of the orchestra had ceased, at first by a profound silence. Then the Princess of Wales arose and clapping her hands, called out "Bravo!" Then the audience arose en masse, shouted, clapped and waived their handkerchiefs. At this moment Cuzzoni frowned, and a scornful smile was visible around her lips. When at last quiet was restored, she stepped forward toward the piano, with an air of a conquering hero, as though there was no such person as Faustina Bordoni in the hall. She sang a brilliant Aria of Cartona, "Amor Indévino," with her inimitable fine coquetry, with all the allurement that she was capable of. Then she trilled and warbled until the air seemed filled with nightingales. Händel was right, she sang like a woman, certainly like a most alluring woman, and Faustina, like a goddess.

The little sorceress was enthusiastically applauded, but her efforts were soon forgotten, when the Venetian rendered a brilliant Aria from Lotti's "Alessandro Severo." The strange singer played with the most difficult passages, runs, trills, cadenzas. Like a child playing with flowers, she seemed a fairy, who was generously throwing to the poor children of earth her inexhaustible treasures of pearls and precious stones. The effect was overpowering, and the beautiful Cuzzoni in her favorite "O tu idol del mio enore," with which she had heretofore always captured her audience, failed to do so on this occasion.

After the concert, the two rivals were invited to the royal box, and there Cuzzoni was presented with a valuable ring by the Princess of Wales. For Faustina the princess took the beautiful bouguet of roses, which she had worn on her breast, and twining them into a wreath, with one of her sweetest smiles, she crowned the head of the Venetian singer.

IDEAS.

FRANK H. TUBBS.

Expression.

When a sweet-voiced tenor sings so that people are affected to tears, we are quite ready to admit that he sings with expression. Intellectual analysis, perhaps, the day after the concert, will make us wonder what he did and how he did it. We may then decide that he made fools of all of us. It is the cool analysis, made at the moment, which enables the critic of the morning paper to tell us that the very man who influenced us so strongly was not much of a singer after all. That which he used may have been sentimentality which appealed to the heart only. Real expression conveys the true meaning of the sentiment of poet and composer. It is comprehended by the singer and is made by him to be perceived by the hearer. One who sings every thing the same way does not sing with expression. An actor who plays every part the same, and is always himself, is not a good actor. He who changes himself and becomes the character which he represents is an actor. Some there be who make us forget their very name. Lackaye in "Joslyn," was not the same man he was in "Children of the Ghetto," and by his submerging of self into the different parts demonstrated his greatness. A singer who sings Schubert's "Serenade" and Thomas' "Swan's Farewell" in the same way, does not sing with expression. Versatility is really uncommon. We practice for tone until our students are branded by the stamp of the teacher. It is no compliment to say that the pupils of a certain teacher all sing alike. Individuality should be appealed to and the singer should be made an artist.

The words have meaning. The means at the command of the singer are voice, manner and facial expression. Each of these must agree with the other and all be in keeping with the sentiment to be expressed. If one is wrong there will be no true expression, because there will be no correct expression. We often find an audience satisfied with a singer, and they give him unstinted praise, who has no claim to intelligent endorsement. Probably so long as this is so, singers will not bother to think what they can be and do. Yet one who has deep interest in his art, will live above the mere plaudits of the popular audience. For art's sake he will make himself a true artist and not an imitation article. "Art is long," and to be an artist requires the study of a lifetime. Audiences are ignorant, and if they are spared the shock of false intonation and the singer displays pretty tones, they are satisfied. But this only does not make the singer an artist, nor does it say he sang with expression.

Singing from Memory.

"I never allow my pupils to sing in public with the music before them," said a teacher recently, and she seemed proud that the pupils could do so. She forgot that the very act might be destructive to good singing. We say "might" be so and not that it is so. The act of calling to mind the music, demands mental exercise which not every one is capable of using without showing it. Then, singing without music shows effort. As another says, "The machinery creaks!" When singing, every part of the machinery must work so smoothly that no one can see it work. "I have heard of your reputation as a teacher of breathing," said a lady at the close of a recital, "and I came here to-day to see how you did it. But, to save me, I can't tell, for I haven't caught you taking a breath all the evening." That is the way all acts which form a part of the great act of artistic singing should be used. Singing without notes may be only a feat of daring. To be sure, if one is ever to become able to be free from the printed page there must be a beginning, and the student-time is the right time for making trials. The teacher should, however, decide before the day of the recital whether or not the student can so make himself a part of the song and the song a part of himself, that he can appear as if he were singing his own song and "making-it-up" as he goes along. Then only is he to be allowed to sing without his notes. The old Italian operas were filled with songs. Again and again have we seen a singer who was quite in sympathy with his part, and quite lost in it, when he came to the song, drop all thought of the opera and stand out in his own individual personality. A noted tenor does this always in "Faust." He is a good actor and through the first act you forget him. He is then the rejuvenated Dr. Faust. But when he reaches "Salve Dimora," he is Mr. So-and-So.

We may quite agree with the idea that a story (especially a witty one), is better told than read aloud. But we question whether an elocutionist gives us the poem better than does a reader. The reader will have his subject well in hand and probably have it committed to memory. He will not be confined to his notes. A glance now and then into his book is all the attention he need give the book. That is all a singer needs of his music. He should certainly know his song so well that if a page happens to fall he can go on as if nothing had happened. A noted professional lost a page, one time, and had to stop, go to the piano and arrange the music and begin all over again. Of course, that was unfortunate and wrong, but even then she gave a better rendition than would one who was struggling with memory. Having the music in hand also gives a relief to a stiff attitude and gives the singer something to do at moments which might otherwise be nervous ones. There is, it seems, something to be said on both sides the question, but with more weight for endorsement of having the music in hand when before the audience.

Language of Music.

One who attends concerts with the desire to get something more than mere amusement, has words spoken to him which sink deep into his very nature. It "speaks a various language." There is a meaning in the music as well as in the words. The very harmony of vibration, represented in chords, has a message. It arouses now, later it passifies; now it starts the tear, then it provokes mirth. Can any one describe in words the power of music? That is, its power over a thinker. The distinction should be made between the one who uses music for pleasure and he who changes his very nature by and through music. The first is entertained; the second, educated. The first is a trifler with music; the second, a soul-improver. To the latter music opens a world. He may enter it and find therein beauty, happiness and spirituality. To him is the choice language of music more than meat and raiment. No price can be placed upon it and he will have music. If he cannot hear the great artists he will make music in some form himself. It will grow in him and make his life noble.

Sometimes we find in magazines and newspapers jests on music and musicians. Coarse jests, often. How shall we treat them and how feel toward the joker? Those persons cannot know the meaning of music. They have never heard the language of song. Their souls have not been touched. We will not show them contempt, but that pity which must be given the one who treats sacred things lightly. They are ignorant. We will hope they may some day "grow in grace," and come into the knowledge of musical truth. Let us who know something of the language of music, gather all the lessons she has for us and let our light shine for the good of the whole world. In this we have joy: There is no limit to the beauties of music's language. One lesson learned but makes the way for other and greater. We are born into the light, and so long as life lasts we will be illumined.

Concentration.

The most pronounced successes among teachers have been made by men who were specialists. No teacher who combined instruction in piano, voice, organ, harmony and violin ever made great success. The different branches are too great for any man or woman to master. One branch can be developed pretty well. Going a step farther, we would say that within his own branch every teacher should have a specialty. A vocal teacher who tries to teach reading at sight, voice culture and rendition of all kinds of music does not reach the great results which bring distinction. He would do better to use but one. Take voice culture, for instance. Let him know definitely a few correct principles and hammer on those. They will help all pupils who come to him. Some pupils will use them to such effect that they will become artists. The special power which each teacher has will become known to his public in time, and those who want just what he can do for them will visit his studio. He will then make every pupil succeed. That is what he is working for. He cannot enjoy laboring over those pupils whom he cannot help. It would be better for him if he would send such away to another teacher. He would lose nothing in the end by doing so. Probably nothing which we write in this department will induce older teachers to abandon their ways, no matter how much it would benefit them, but we urge upon those just entering the profession to resist the temptation to generalize and to concentrate their might on one thing. Make a reputation on that and there will be business enough.

THE ORGAN.

Organ and Choir.

THE PEDAL PART IN ORGAN MUSIC.

WM. HORATIO CLARKE.

THE PEDAL SECTION.

It is the Pedal Section which gives the organ its vast superiority, dignity and solemnity beyond the capacity of all other musical instruments. It is the most expensive section of the organ, and on this account its proper size and capacity is generally circumscribed from motives of economy, which is detrimental to the art of organ building.

A Pedal Section should contain enough variety in number, quality and power of stops to render coupling with the manuals unnecessary, excepting when an extreme fortissimo is desired. It should consist of the extension downward of duplicates of the I Manual and several of the softer II Manual stops, an octave lower than the respective manual pitch. In addition to these it should also contain as a fundamental element, its own distinctive large scale wood stops, such as the 16 ft. Pedal Open Diapason, 32 ft. Sub-Bourdon, 16 ft. Bourdon, Gamba and Dulciana. The 32 ft. Open Diapason is only placed in organs of the largest capacity.

The financial limitations generally restrict the proper balancing of the bass in Church organs, and hence there are few standard instruments. The idealist is compelled to recognize that in material matters, art is subservient to monetary conditions, sometimes akin to valuing paintings by the square yard, or statuary by the pound, and the best must be made of these limitations without complaining of what cannot be helped. Yet it is well to consider what a standard should be, and hope for its culmination. As the clumsy mechanism of the past century is now obsolete in organs of present construction, so none of the ancient instruments can be held up as musical standards when possibilities are being considered.

THE PEDAL PART.

Enthusiastic organists are very ambitious to attain a rapid pedal execution and to exhibit their fluency in this technique in their selections in their programs. No player can be too proficient in this respect, but it should not be carried to extremes in a recital, because speed is not a requisite to be publicly exhibited, for sometimes the result is "love's labor lost."

It should be clearly understood that in the speech of the lower pedal pipes, a certain amount of time is required for the large columns of air within the pipes to be set in vibration so as to produce a defined tone. It should also be borne in mind that the auditory nerves of the ear are not actuated instantaneously by the slow and ponderous sound waves, and that there is a limit to the recognition of musical tones below a certain depth of pitch.

The lower tones of the 32 and 16 ft. flue pipes require a definite time for the vibrations to be set in motion. This is an inevitable law in the production of sound, concerning which much judgment should be exercised in the composition of organ music, the use of pedal stops, and the rapidity of pedal passages.

Were it possible for the pedal pipes to speak promptly, the ear would not quickly perceive the tones of rapidly played lower notes if they could be produced from the largest pipes. Even in a symphony orchestra, in passages where rapid execution is given to the lower strings of the double-basses, the result produces only the impression of confused sound, and the violoncellos generally play the same passages at an octave higher pitch so that the ear may perceive the tones.

The old organ composers in their elaborate fugues did not consider this important point in the architectural form of their compositions, because they were writing not so much for the capacities of the instrument, as to develop an intellectual form for the eye to see, fully as much as for the ear to hear. In point of fact, the progression of parts in much of this music is so intricate that the eye can only see what is intended, which the ear cannot perceive in simply listening to the music.

In composing the higher forms of the organ music of the future, the pedal part will receive more specific treatment. In fugal movements the manual parts will carry out all the figures complete, and the pedal part will introduce the themes in augmentation, and with slow counter subjects giving the ground work of the harmonies involved.

Where a rapid passage is to be given in the manual bass part, if it is to be strengthened and made more massive by the pedal part, it will be given in outline rather than with each individual note, as thus illustrated, the manual keys not being coupled to the pedals :

or thus :

If the Pedal Section should have the proper capacity and variety, much better effects may be produced by using the independent pedal part uncoupled with the manuals, but with the limited Pedal Sections as found in most Church organs, it is quite essential to have the manuals coupled with the pedals for the sake of distinctness and variety.

VARIETY IN PEDAL REGISTRATION.

As much variety as possible should be given in the pedal part. This would be better attained if organs were so constructed that on drawing a manual stop, the proper pedal stop of a corresponding quality and power should also be brought on automatically. In this way the requisite proportion of pedal power would always be attained by the player with the best results, and this suggestion is commended to the attention of progressive organ builders.

It is very detrimental to the effect of the music for the organist to use the 16 ft. Pedal Open Diapason too long at a time. Its deep, pervading tone tires the ear if the heavy rumbling pulsations are continued too long, and it weakens the effect of the manual parts. The use of soft 8 ft. pedal stops at times, renders the 16 ft. stops more agreeable when they enter.

Excepting in full choruses and congregational singing, the 16 ft. Pedal Open Diapason should be used with careful judgment, as its thunderous tones in the lower notes cover the blending of the voices and weaken the vocal effect. Yet it is the most important stop in the Pedal Section when properly used, and an instrument which does not contain it is not representative of a grand organ.

Pedal reed stops are prompt of speech and give distinctness to the pedal pitch, but are used only in the full organ.

From much experience with resultant tone pedal stops such as the 10⅔ ft. Pedal Quint, they are not recommended, for they only add a confused effect without augmenting the musical power. They were introduced with the idea that the union of a 16 ft. stop with another softer stop a fifth, 10⅔ ft. higher, would produce a sound wave which would give the effect of a 32 ft. stop in imitation. Such stop-knobs are sometimes marked "32 ft. Resultant." It is true that a vibration is produced resembling the 32 ft. pulsation with three or four of the lowest notes, but it is not legitimate or satisfactory, only adding a confused rumbling sound.

In an organ still in use, the builder made a mistake in the pitch length of the Pedal Quint, and instead of sounding the fifth, the pipes gave the *fourth*. Instead of cutting off the pipes the right length, he permitted the stop to remain in the organ as it was, giving a fourth instead of a fifth, on the assumption that it would serve its purpose just as well! Noise and musical art belong to different spheres of vibration.

SERVICE PRELUDE NO. 3.

This Andante Recitative begins with a religious movement upon the Swell 8 ft. flue stops and Pedal 16 ft. Bourdon, after which the theme is taken by the Great 8 ft. flue stops with the Pedal 16 ft. Open Diapason added, in unanticipated transitions and modulations which lead to the tenor Recitative upon the Great Melodia and Dulciana with Swell coupled, at the sixteenth measure.

The tenor Recitative is responded to in the bass passage upon the Great Gamba and Melodia. If the organ has not a Gamba, this passage may be played upon the Great Open Diapason.

The first theme then enters for eight measures, when the Recitative is taken up by the manual bass. Next follows a responsive passage upon the soft Swell stops with the 4 ft. Harmonic Flute added, which leads to a Cadence of the opening theme, while the accompanying parts are alternating in rhythmic imitation.

The harmony of the manual parts is complete independent of the pedal part, so that the notes may be played upon a reed organ, but with the pipe organ the pedal notes are needed for a fundamental effect. In order to give a variety in the bass, a number of measures are silent in the pedals.

The changes of stops should be made so that there will be no break in the tempo, and so that the operation of changing will not be perceptible, especially in measures 41 and 42. In addition to the interpretation of the thought contained in this Service Prelude, it forms a practical study in the art of registration.

THE NEW ORGAN IN ALL SAINT'S CATHEDRAL, ALBANY, N. Y.

The new instrument in this Episcopal Cathedral was built by the Austin Organ Company, of Hartford, Conn. It is divided, and stands on both sides of the Choir, filling two arches on each side. The front pipes are not decorated, and stand on the high back of the beautifully carved stalls. There are four manuals with electro-pneumatic action.

It is built with the Austin Universal Wind Chest, in which every pipe stands over a large room filled with air under pressure. This room may be entered while the wind is on and the organ is being played, so that the mechanism is fully exposed while in operation.

The stop-knobs are placed in stop jambs set vertically at an angle of forty-five degrees with the line of keys, and there are a large number of piston and pedal movements. The wind pressures are 4 in., 6 in., 7 in. and 16 inches, and the instrument is tuned to the International Pitch, 435 A. It has the full modern Manual and Pedal compass with no divided stops, according to the following specification :

I.—DIAPASON SECTION, ON OPEN SOUND BOARDS.

16 ft Major Diapason.
8 ft. Principal Diapason,
8 ft. Small Diapason.
8 ft. Gemshorn.
8 ft. Gross Flöte.
4 ft. Octave.
4 ft. Flute Harmonique.
2⅔ ft. Octave Quint.
2 ft. Super Octave.

SECOND SECTION, ENCLOSED IN CHOIR SWELL BOX.

8 ft Geigen Principal.
8 ft. Gamba.
8 ft. Doppel Flöte.
V Rk. Mixture.
16 ft. Trombone.
8 ft Trumpet.
4 ft. Clarion.

II.—ENCLOSED IN HEAVY DOUBLE SWELL BOX.

16 ft Contre Viole.
8 ft. Open Diapason.
8 ft. Viole d'Orchestré.
8 ft. Salicional.
8 ft. Rohr Flöte.
8 ft. Quintadena.
8 ft. Voix Celeste.
8 ft. Vox Angelica.
4 ft. Octave.
4 ft. Flauto Traverso.
2 ft. Flautina.
IV Rk. Mixture.
16 ft. Contra Posuane.
8 ft. Cornopean.
8 ft. Oboe.
8 ft. Vox Humana.

III.—CHOIR SECTION, ENCLOSED IN HEAVY DOUBLE SWELL BOX.

16 ft. Contra Gamba.
8 ft. Viola.
8 ft. Echo Salicional.
8 ft. Melodia.
8 ft. Gedeckt.
8 ft. Unda Maris.
4 ft. Fugara.
4 ft. Flute d'Amour.
2 ft. Piccolo.
8 ft. Orchestral Oboe.

IV.—Solo Section, on Open Sound Boards.

8 ft. Concert Flute.
8 ft. Violoncello.
4 ft. Violin.
4 ft. Harp Æolian.
16 ft. Tuba Profunda.
8 ft. Tuba Mirabilis.
8 ft. Corno di Bassetto.

Pedal Section.

32 ft. Major Diapason (open).
16 ft. Principal Diap. (open).
16 ft. Open Diapason (metal).
16 ft. Violone.
16 ft. Dolce.
16 ft. Bourdon.
8 ft. Gross Flöte.
8 ft. Flauto Dolce.
8 ft. Violoncello.
16 ft. Bombarde.
8 ft. Tuba.

ANSWERS TO QUESTIONS.

Improvised Thunder-Storms.

C. J. C.—"Do the imitations of 'thunder-storms' at organ recitals belong to the realm of art, or are they travesties of organ music? I ask this question because I have often heard the talents of certain players rated by their ability to closely imitate thunder, rain, howling winds, birds, lowing of cattle, bag-pipes, etc., united with the turning down of the lights to represent clouds and darkness, and flashing them up to imitate lightning—in fact, any kind of stormy sensation which is suggestive of the raising of an umbrella. Even editors of papers grade a player by this ability, to my utter disgust. Even when a grand fugue is being played, I have seen men who list themselves as musicians, look at each other and revolve their hands as if turning the crank of a hand-organ, thus expressing their lack of appreciation!"

Answer.—Organ "thunder-storms" belong neither to the realm of art or nature. They are simply "elephantine tricks" in which a classic artist will not indulge. But the masses of the public who do not understand true music, but delight in the romance of thunder-storms—at a distance—are enthusiastic over them and often will crowd a Church on the prediction of such a cyclone.

These mysterious and wonderful "storms" are the one thing travelers write about on listening to the organs in Haarlem, Freibourg, Lucerne, etc., where daily performances are given for the entertainment of tourists. Some of the old organs have a "thunder pedal," which holds down the valves of two or three of the largest pedal pipes to produce a roar. Large revolving cylinders with dried peas or beans in them which imitate rain or hail, when set in motion, have also been put in organs as an adjunct to the popular thunder effects.

In addition to the regular "tricks," some very startling effects are produced by arranging on the side of the organ, tiers of boards with broken window-panes, torpedoes, stones, etc., covering them, temporarily propped up several feet from the floor on sticks, the prop to be pulled out when the final crash is to take place. When the grand smash comes, the lights are turned suddenly off, and the dazed hearers feel that the lightning has struck and torn off the side of the edifice. The smiling Church officials, including the minister, pronounce this climax to be a "bang up" success, as it is such fun for the young and old boys, seldom seen or heard in the sacred edifice!

The witty fellow with whom it has been pre-arranged to raise an open umbrella in the midst of the storm also "brings down the house," and is deserving of his share of the applause as well as the celebrated player. It not unfrequently occurs on the opening of a new organ in the country, that when this manufactured storm increases, some of the credulous farmers are so hypnotized by the close imitation to nature, that they leave the room and see if their horses and teams are protected from the rain! Such an effect could only be produced by a player of more than usual thunder-ability, or heavy-weight talents. So the local newspaper report of the concert will rapturously credit him as being "out of sight," and the most wonderful organeer who has ever walked the treadles on foot notes in that section of the country, which testimonial is added to the next issue of his professional circular.

There is quite an incongruity between a fugue and a hand-organ, and to the musicians of whom you write, it is possible that the fugue alluded to *was* a kind of a "grind," especially if they had been patiently waiting for the "thunder-storm."

It is no wonder that you are annoyed by the false estimate placed upon assumed talents over which the banner of Art is flimsily suspended, but as long as the Church-going public are pleased to be entertained by sensational tricks on the organ, there will always be a plenty of egotists who will cater for the applause. A love for true art and reverence for the organ will not pander to an uneducated taste, nor make a travesty of the grand instrument.

Registration for Fugue in D.

J. P. C.—"In accordance with your suggestion in the April number, I enclose my scheme of the registration for the Bach Fugue in D. I will also write out my plan of registration for the G major fugue."

(Readers of The Musician who have the Peters' Edition of Bach's organ music will find this Fugue in Book IV, page 17. Dr. John P. Campbell, of the University of Georgia, has kindly sent the following registration to which reference was made in the April number. The registration is to be written in pencil in the score).

I Manual.
8 ft. Gamba and Dop'l Flöte.
II Manual.
16, 8 and 4 ft. stops with reed.
11 mea. coupled to I.
Ped. 16 ft. Bourdon I coupled to Ped.
1 Mea. L. H. on II.
6 Mea. L. H. on II, R. H. on I.
11 Mea. Last beat I both hands.
15 Mea. L. H. II, R. H. I.
19 Mea. Both hands I.
28 Mea. Both hands II. I Gamba off, Ped. coup off.
30 Mea. L. H. I, R. H. II.
34 Mea. L. H. II. On 2d note of 3d beat, add I Gamba.
38 Mea. Both hands II. On 4th beat, L. H. on I. Coup. I to Ped.
42 Mea. Both hands II.
47 Mea. Both hands I.
54 Mea. R. H. II, L. H. I with 4 ft. Octave added.
55 Mea. L. H. in thirds II, then both hands I.
58 Mea. L. H. II, R. H. I. I to Ped. off.
59 Mea. L. H. I, R. H. II.
60 Mea. Both hands II.
61 Mea. Add full II and I to Ped.
64 Mea. Both hands I on 3d beat.
80 mea. Add Ped. 16 ft. Open Diapason.
86 Mea. Both hands II, Swell closed Crescendo to 88 mea. I to Ped. off.
88 Mea. Ped. 16 ft. Open Diapason off.
90 Mea. L. H. I, R. H. II.
91 Mea. L. H II II, R. H. I.
92 Mea. Both hands II up to 4th beat, then R. H. I.
93 Mea. At 4th beat, L. H. I, R. H. II. I to Ped.
96 Mea. Both hands I.
102 Mea. Full Pedal.
106 Mea. Add I Open Diapason.
114 Mea. Add Twelfth and Fifteenth.
116 Mea. Full Organ.

Church Music in America.

The religious organizations established upon certain portions of the ancient Scriptures in which music performed an essential part, are grouped under the systems of the Jewish, Latin or Roman, Greek or Eastern, Anglican or Episcopal, and German or Lutheran.

With the exception of the Greek Church, the Churches of the United States are descended from all these national organizations, and American Church music has no national standard. Its great variety is distributed among Adventists, Baptists, Calvinists, Campbellites, Christians, Christian Scientists, Congregationalists (Trinitarian and Unitarian), Episcopalians, Evangelists, Faith Healers, Friends, Gospel Workers, Independents, Hebrews, Lutherans, Moravians, Mennonites, Methodists, Mind Curers, Mormons, Presbyterians, Reformed Dutch, Reformed Episcopal, Roman Catholic, Salvation Army, Spiritualists, Swedenborgians, Universalists, Universal Truth, etc., etc.

The most stately music is found in the largest edifices of the High Episcopal, Roman Catholic Churches and Hebrew Temples. The full Cathedral Service with its surpliced choirs of mens' and boys' voices is a standard for the Episcopal order. The Roman Catholic service with choirs of mixed voices has two standards, the Cecilian, in which the style of Palestrina based upon the Gregorian modes, is a fixed standard with the conservative branch, while the liberal wing uses the more ornate Masses of Haydn, Mozart and quite operatic compositions of modern composers.

The wealthy Presbyterian, Baptist, Methodist, Trinitarian and Unitarian Churches employ talented singers and organists at high salaries. The Evangelical Churches of all denominations in country districts use a similar homogenous grade of choir music, while revivalists and sensational religious organizations use the cheapest order of musical compositions as found in "Gospel Hymns."

The city singers and Church attendants come in contact with the best instrumental and vocal music, while those who reside in towns and villages remote from musical centers have not the same privileges, and the grades of musical culture do not permit the choirs to attain so high a proficiency.

The progress of Church music in the country depends chiefly on the talents, energy and tact of the choir leader. If he has cultured himself and is progressive and has enthusiasm for the art, he will gather around him other spirits who will strive to perform the music as well as possible, and take pains in the preparation for the Sunday services.

Then if minister and people encourage their efforts, whatever grade of music which they attempt according to their capacity of execution, will be good.

Good Church music is not necessarily difficult of execution, and its success depends upon the expression given and the appropriate adaptation to the service.

Vesper Services.

Many Churches hold stated Vesper Services in which a program of sacred music is given at evening by the choir and organist. This is a very commendable feature in the progress of musical culture. The range of subjects is larger than is used in the morning service. Even among the more strict denominations, Sunday afternoon organ recitals are countenanced, which is also a step forward, and Sunday evening musical services are becoming popular.

A Vesper Service gives a stimulus to the members of the choir in the preparation of a more ornate grade of music, and affords an opportunity to illustrate their culture, which is not appropriate in the customary morning formal service, where the words of the anthems and choir music are taken from the psalms and devotional portions of the Scriptures and Prayer book.

In this service the music is allied to religious hymns and introduces sacred song solos interspersed with appropriate organ music. It not only gives zest to the choir work by means of extra rehearsals and the development of individual voices, but it furnishes food for minds which hunger and thirst for good music well rendered, with surroundings in harmony with meditative thought and a religious sphere, thus differing from the environments and influences of the public concert room.

The Vesper Service is a welcome indication of an increasing interest in choir work which will continue to extend until the regular Sunday evening service will become a strong power in augmenting a greater love for sacred music.

Organizing a Choir.

M. A.—"After many years of quartet music, our society has decided to install a chorus choir, and I have been appointed to organize it as the director in addition to my duties as organist. We have room in the gallery for twenty singers. Can you give me any advice in reference to the best manner of organizing this choir, and the distribution of parts?"

Answer.—Before bringing any singers together for a conference on the subject, it is suggested that you make out a list of names of those who will be likely to be interested, who possess good voices and who can read music. Do not put down among the number the names of any whose voices do not meet your approval, or whose social qualities will not blend with the others.

From these names choose three who are in sympathy with you who will coöperate together and be efficient in acting with you, and who will agree to serve as a choir committee to attend to all the details of membership. Then with this committee extend the invitation for an initiatory rehearsal. At this rehearsal simply state what is proposed to be done, without discussion, and obtain the verbal consent of each to become active members, and their agreement to furnish competent substitutes in case of absence. There need be no constitution nor further obligations.

Have your music all selected for this rehearsal, and go to work at once in producing the best musical results. This will create an interest which you must use every effort to sustain so that it will be esteemed a privilege to become a member of your choir.

If the influential members of the Church take an interest in the new choir, its social element may be cultivated by having a choir social each month by invitation at the residences of these friends of the movement, which will serve to hold the choir together.

In your management, one of the chief things to guard against, is the manifestation of partiality which tends to excite jealousy. The first intimation of this will be likely to be noticed in the distribution of solo parts, concerning which singers are very sensitive. You will avoid this rock of offence if at the very outset you can organize upon the basis that no individual solos will be sung in the Church services, but that the voices on each part will unite on the respective solos, and with proper drilling, the result will be satisfactory to all. In this respect, much will depend on the selection of pieces which contain solos adapted to this method of rendering them. The place for individual solos will be at the choir socials, and at concerts which you will occasionally give, in which every singer who is willing, will have an opportunity. All other exigencies will have to be met as they occur. In a choir of twenty, if the voices are evenly balanced, a good proportion would be six sopranos, four altos, four tenors and six basses.

Voices Falling from Pitch.

J. L. A.—"Is there any remedy for the voices of a choir falling from pitch? On a recent occasion my choir sang three verses of a hymn in the service without accompaniment after the organ had played the prelude, and when the interlude was played, the organ came in a half tone higher on account of the voices

having become flat to that degree. The effect was such that the entire choir were discouraged on account of many unfavorable comments which this defect elicited."

Answer.—There is a tendency to become flat of the pitch when any chorus sings unaccompanied. For this reason, when a choir sings at length without an instrument, it is a good plan to end with the voices alone, and thus the lowering of the pitch will not be observed, because the sinking is so gradual.

Tell your singers not to be discouraged. I once heard a large well drilled chorus of four hundred voices sing several selections under the direction of Gounod, the composer of "Faust." Among the numbers was Mozart's well-known "Ave Verum." It was beautifully rendered, opening with muted voices, the mouths being closed, and then in the crescendos where the harmonies modulate into another key the mouths were opened and the tones swelled out with an inspiring effect. Having my tuning fork with me, I made a study of the flatting from the pitch under the most favorable conditions. In singing through this number, the voices which began in the key of F, ended in E♭, two semitones below the pitch. After that test, I was never troubled by a fact which has to be accepted.

If you have ever had anything to do in the line of teaching vocal music in public school work, you know how soon the voices of the children become flat in singing scale exercises. In drilling upon the lower notes of the scale, their voices become so flat that when the fifth is reached, it is invariably very flat, if there is no instrument used other than the little reed pitch pipe which is provided. For this reason, the first musical instruction in public school work should always be accompanied by a musical instrument. If this is not done, a poor foundation will be laid, as the sense of correct tone relationships will be false, and seed sown which will be hard to eradicate in future years. Rather than have an erroneous sense of relative pi ch thus engrafted, it would be better to have music omitted from the curriculum of public school work in the lowest grades, and simple melodious songs taught the children until musical education can be pursued under better advantages.

In the Roman Catholic and High Anglican service where there is a long passage for the intoning priest, the voice so falls from the pitch that it is customary for the organist to follow this flatting by occasionally touching a note on a soft stop so that in the appropriate responses by the choir, the organist will take up a key which has relation to the pitch of the intoning voice.

GRADED CHOIR MUSIC.

Grade I.

Hymn Anthem.—"Awake and sing the Song of Moses and the Lamb!" T. D. Wiliams.

Key of C. 4-4 Allegro. Four minutes. Highest note in treble, G. 4 pages, 10c. For chorus throughout in martial rhythm in the style of a processional. It is dedicated to the choir of the First Presbyterian Church, of Altoona, Pa.

Hymn.—"I shall see Him." John C. Walling.

"I shall see the King in His beauty,
In the land that is far away."

Key of G. 4-4 Moderato. Two minutes. Highest note in treble, E. 2 pages, 6c. The music is set to three verses of Rev. A. J. Gordon's well-known hymn. The first verse is for soprono or tenor, and the two following verses are for a chorus in four parts.

Grade II.

Kyrie Eleison.—"Lord Have Mercy." B. Luard Selby.

Key of F. 2-2. 2 pages, 6c. Highest note of treble, D. Three alternate settings of responses to the Commandments as used in the Episcopal service. From the "Service in F."

Anthem.—"Be Glad, O ye Righteous." Ps. 32 : 12 and 30 : 5. George A. Burdett.

Key of E♭. ¢ Moderato. Five minutes. 10 pages, 16c. Highest note in treble, G. For mixed chorus, with an alto and tenor duett on "For His wrath endureth but for a moment." Highest note in duett for tenor, F; Alto, E♭.

Jubilate Deo.—"O be joyful in the Lord." Albert J Holden.

Key of F. 4-4 Allegro Moderato. Three minutes. 5 pages, 10c. Highest note in treble, F. After the opening with full choir, a trio of soprano, alto and tenor renders, "Be ye sure that the Lord, He is God," and a soprano solo of twelve measures leads to the Gloria.

A Dream of Paradise. Hamilton Gray.

"Once in the evening twilight,
I dreamt a happy dream."

Key of A♭. 4-4 and 12-8 Andante. Three minutes. Highest note in treble, F. 6 pages, 12c. A well-known religious song arranged by Paul Löring as a choir piece with a solo for soprano or tenor. Suitable for a Vesper Service.

Hymn Anthem.—"Gently Lord, Oh! Gently Lead Us." W. Berwald.

Key of G. ¢ Andante. Three minutes. Highest treble note, E. 5 pages, 12c. An organ introduction of nine measures introduces a soprano solo in the first four lines, after which the other parts enter with rhythmic imitation of the theme, when all unite with the syllables of the words together in the last verse.

Anthem.—"The Lord is my Shepherd." T. D. Williams.

Key of D. 4-4 Larghetto. Four minutes. Highest treble note, F♯. 4 pages, 12c. It begins with a pianissimo chorus which introduces "He maketh me to lie down," as a quartet, the full chorus entering at "He restoreth my soul." The quartet takes up "Yea, though I walk through the valley" in E♭, modulating to the key of C for the chorus at "For Thou art with me." The quartet sings in A minor at "Surely goodness and mercy," and the chorus ends the psalm in D.

Hymn Anthem.—"Be Thou, O God." C. E. VanLaer.

"Be thou, O God, by night, by day,
My guard, my guide from sin,
My life, my trust, my light divine,
To keep me pure within."

Key of D♭. 4-4 Andante. Two minutes. Treble to F. 3 pages, 10c. For four parts without solos. The harmony is good and the crescendos effective. Well adapted for a response after prayer. The words are enunciated together.

Hymn Anthem.—"Rejoice, ye pure in heart." Edward Whitby.

Key of C. 4-4 Allegro Marziale. Three minutes. Soprano to G. 6 pages, 6c. A spirited piece beginning with a march-like movement for chorus preceding a soprano solo in G, and a soprano and alto duett. In the next phrase of pianissimo chorus, a crescendo leads to a forte bass solo in C with the climax on high E♭, the anthem closing with the full chorus. It is in the style of a joyful processional, and will be well liked.

Grade III.

Hymn Anthem.—"Now the day is over." Frank L. Sealy.

Key of E. 4-4 Andante. Three minutes. Soprano to F♯. 5 pages, 12c. For quartet or chorus, with soprano and alto solo. Suitable for close of evening service.

Anthem.—"Give Peace in Our Time, O Lord." Dr. Charles Vincent.

Key of F. 4 4 Andante Moderato. Five minutes. 6 pages, 8c. Treble to F. A setting to words from the Liturgy for either soprano or tenor solo, with chorus and organ accompaniment in smooth devotional style.

Anthem.—"Fear thou not! For I am with thee." Is. 40 : 10, 12, 13. Adolph Frey.

Key of G. 3-4 Andante. Four minutes. 5 pages, 12c. Soprano to G. After a short organ introduction the theme for sixteen measures is given out as a soprano or tenor solo, followed by its repetition by the chorus. The bass tutti then leads off with an energetic subject in quadruple time, which is answered in imitation by the other parts, the anthem ending with the first theme tutti.

O Salutaris Hostia.—"O Saving Victim." (Latin and English words.) Arthur F. M. Custance.

Key of B♭. 4-4 Andante religioso. Five minutes. Soprano to E♭. 5 pages, 6c. Solo throughout for baritone or alto accompanied by a four part chorus. The highest note of the solo is D, and will prove a very acceptable anthem where these words are appropriate to the service. The same number contains a tender response of one page to be sung without accompaniment, "Thy Life was given for me." Grade II. John H. Gutterson. Key of D♭. One and a half minutes. Soprano to D♭. Two verses.

Anthem.—"Blessed are the poor in spirit." Henry Hiles.

Key of E♭. 4-4 Moderato. Three minutes. Soprano to G. 5 pages, 5c. For full chorus without solos, with an obligato accompaniment for a two manual organ.

Grade IV.

Anthem.—"O How Amiable are Thy Tabernacles." Thomas Whitney Surette.

Key of E♭. 3-4 Con moto. Three minutes. 6 pages, 5c. Soprano to G. A chorus for a full choir with an organ obligato, and a solo for soprano or tenor with the words "Yea, the sparrow hath found her an house."

Te Deum.—"We Praise Thee, O Lord." Henry K. Hadley.

Key of G. 4-4 Allegro Moderato. Four minutes. 6 pages, 5c. Highest note, E. For voices in unison throughout with organ harmony. The changes of key are numerous, ranging from G to B, A and D♭. E is high for bass voices to sing easily without effort. In a unison Te Deum the voices should not ascend above D.

Hymn Anthem.—"O Lord, Thou art my Strength." Benjamin Godard. Arr. by P. A. Schnecker.

Key of D♭. Andantino. Four minutes. 4 pages, 10c. Soprano to F. Tenor to G♭. It begins with a quasi recitative in F minor leading to the soprano solo:

"Let me with light and truth be blessed,
Be these my guide to lead the way,
Till on thy holy hill I rest,
And in thy sacred temple pray."

A tenor solo takes the next verse, and the four parts unite on the third verse.

Anthem.—"O Lord, Thou hast searched me." Frank L. Sealy.

Key of E♭. 3-4 Moderato. Four minutes. 6 pages, 5c. Soprano to F. A Church-like setting of Psalm 139, with an excellent organ accompaniment. The chorus parts contain good harmonies with short fuga phrases. There is a soprano solo of twelve measures, "O how precious are Thy thoughts toward me."

Grade V.

Magnificat and Nunc Dimittis. H. Walford Davies.

Key of C. 4-2 Allegro con dignita. Magnificat, five minutes; Nunc dimitis, two and a half minutes. Soprano to G. 16 pages, 15c. For full cathedral choir with obligato in rich and varied harmonies, in true Anglican form. It opens with a duett between the soprano solo Can. and soprano solo Dec with responsive phrases by full Cantoris and Decani. The tutti modulates from C to A, from A minor to G♭, and into E♭, the Gloria being in C. The Nunc Dimittis follows in the same style, the Gloria in both being the same.

Offertory Sentences.—"While we have time, let us do good unto all men." Horatio W. Parker.

Key of E. 4-4 Andante con moto. Seven minutes. Soprano to F♯. 6 pages, 12c. In strict ecclesiastical form with an effective organ accompaniment. After an organ introduction the sentences begin with a soprano solo. Next follows in 3-2 tempo, a duett for tenor and bass, "Be merciful after thy power," in E minor. After an organ interlude in D, the soprano sings, "He that hath pity on the poor," with the chorus in double common tempo, "Let your light so shine," ending with the full chorus in E, "Give alms of thy goods," all the sentences being connected with organ interludes.

Grade VI.

Anthem.—"Thou shalt remember all the way that the Lord thy God hath led thee." Horatio W. Parker.

Key of E. 4 4 Molto Moderato. Eight minutes. Soprano to G. 12 pages, 15c. A full chorus written for a Church anniversary, with a baritone solo ranging to E. The harmonic changes are such that it can only be recommended for a choir far advanced in musical culture. In certain passages the soprano, alto and tenor are divided into two parts each. The composer is known as an American classic writer, and this solo and chorus with its organ accompaniment is as elaborate as the modern oratorio chorus with its intricate harmonies.

Grade VII.

Anthem.—"O Lord, Thy Word endureth forever." Ps 119 : 89-91. 22 : 25. 103 : 17-19. 3 : 8. J. Frederick Bridge.

Key of A. 6 4 Allegro Maestoso. Eight minutes. Treble to G. 20 pages, 25c. This anthem was composed for a recent Special Service in Canterbury Cathedral for full choir, accompanied with organ and brass instruments. It has one long soprano solo, and the chorus work is polyphonic in structure with an elaborate fugue, which at the finale has a grand climax in contrapuntal form.

IN THE MUSICAL WORLD.

AMONG OUR SCHOOLS AND TEACHERS.

The twenty-fourth concert by pupils of Walter S. Sprangle and Walter C. Tuttle, of Indianapolis, Ind., was given on May 8.

Miss Imogene Areson gave a successful pupils' recital at Flushing, L. I., on May 29. The program was excellent in standard.

Mrs. McIntyre and Mrs. McElroy, assisted by local talent, gave a concert at Gordou, Texas, on April 19. The program was long and varied.

A Musical was given by vocal pupils of Mr. W. C. Howell, and piano pupils of Mr Frederick A. Williams, in Cleveland, Ohio, on Wednesday evening, May 15, 1901.

Pupils of the Kelso School of Musical and Dramatic Art, of Chicago, gave a series of recitals on April 25 and 29 and May 6, at which excellent programs were given.

Pupils of Mrs. Blanche W. de l'Em, of Louisville, Ky., gave a concert recently (no date given). The program was well adapted to show the work of the young students.

The eleventh annual matinee of the pupils of the Sternberg School of Music, Philadelphia, was given on May 16. The program included a demonstration of the Clavier Method.

Pupils of Professor Drake gave a concert at Xenia, Ohio, June 4 which was highly spoken of. Professor Drake also presided at the organ at a mass meeting, playing some excellent music.

Pupils of Mr. S. A. Wolff, of Gaston College, Dallas, N. C., assisted in the closing exercises of the College on June 5. They contributed musical items of merit, and were excellently received.

The closing concert of the Virginia Female Institute, Staunton, Va., F. R. Webb, director, took place June 10. Pupils of Mr. Webb also assisted in a recital by pupils of the elocution department on June 8.

The eleventh annual commencement of the West Virginia Conference Seminary, at Buckhannon, was elaborate and took place June 5-13. Haydn's "Creation" was sung by chorus and visiting artists.

An interesting concert was given by pupils of Beaumont College Conservatory of Music (place not named), on May 27. The program was varied and attractive. Miss Jeannette Birdsall is musical director.

Mr. Wilmar R. Schmidt gave a piano recital at Mt. Holyoke College (Mass.) on May 3. The fine program was played on an instrument with the Janko keyboard. Mr. Schmidt's playing was highly commended.

The Southern Female College (La Grange, Ga.), had its graduating recital on May 17. Miss Ada Berkley was the graduate, and played a well diversified program. The closing concert was given on May 28. Mr. August Geiger is musical director.

The closing exercises of the Pennsylvania State College, took place June 9-12, beginning with the baccalaureate sermon on Sunday and closing with the graduat on exercises on Wednesday. An exhibition drill by the cadet battalion was included.

Signor G. Ferrata, of Gainesville, Ga., has been awarded the prizes offered by the Georgia Federation of Woman's Clubs for the best arrangement of the Chopin Waltz, Op. 64, and the best original composition. These prizes are a gold medal and $100 in cash.

Pupils of Mr. and Mrs. F. Stayton Thompson, of Richmond, Va., gave a strong program of songs and piano pieces July 18. Mr. and Mrs. Thompson are among the most prominent and active teachers in the South, and are doing service in building up musical affairs.

The Krinbill-Liebling Amateur Piano Club, composed of the pupils of Clarence E. Krinbill, of Dixon, Ill., held its May meeting at the home of Miss Pauline Groves, on Saturday evening, the 18th, where essays on Chopin and Schubert and other papers were read, and a musical program was given.

The annual May Festival of Baylor College, Belton, Texas, took place on May 28, under the direction of Eugene E. Davies, director of music in the College. Concerts were given in the afternoon and evening. A ladies orchestra of thirty-five pieces and a large chorus, with soloists took part.

On May 29 and 30 Prof. Franz J. Strahm, of Nashville, Tenn., gave commencement concerts by his pupils. He announces a Summer session, extending from June 11 to August 19. Judging from the extensive list of pupils printed on Prof. Strahm's announcement, he must be a successful and very busy teacher.

Dr. J. N. Blose, of Waynesburg, Pa., removes to Washington, Pa., to teach in the semiuary there next year. Dr. Blose is a successful and progressive musician, a composer of some note, and has exerted a beneficial influence on the music life of Waynesburg for ten years. We wish him success in his new field.

The annual festival of the Conservatory of Music at Yankton, S. D., took place May 27-31. Included were concerts by the Beloit Ladies' Quartet, the Conservatory Orchestra, the Butler Concert Company, a vocal recital by H. A. Smith and a performance of Gounod's "Redemption" by the Yankton Choral Union. This is a splendid showing.

The eighth concert of the Normal Choral Club, of the Normal Training School, Potsdam, N. Y., was given May 7. The first was miscellaneous in character, the second presenting Mendelssohn's Hymn of Praise. The soloists were Miss Grace Wood, soprano; Miss Harriet C. Bryant, contralto, and Francis Ten Eyck Sisson, tenor. Miss Julia E. Crane was conductor.

Pupils of Mr. Emil Liebling gave the following interesting program, in Chicago, on May 11: Allegro Classique, Ravina; Serenade, E. Liebling; Hommage a Haendel (for two pianos), Moscheles; Nocturne, Chopin; German Dance, Beethoven; Valse de Concert, Palumbo; Etude in C minor, Chopin; Elevation, Chaminade; Hungarian Fantasie (with second piano), Liszt.

The commencement concert of the Grand River Institute, Austinburg, Ohio, took place on June 12, with Mrs. Emma M. Harmon, vocalist; Mrs. H. E. Whilsey, pianist; Miss Clara Austin, organist, and H. W. Luethi, director. A number of choruses of "The Messiah" and other oratorios were sung by a large chorus. Pupils of Mr. Luethi gave a recital at Ashtabula, Ohio, on June 8.

Four hundred and twenty dollars in scholarships are offered by the Landon Conservatory of Music, Dallas, Texas. Three piano scholarships of $100, $80 and $60 each; one violin scholarship of $80 and one vocal scholarship of $100 are included. Examinations will be held at the Conservatory September 7 and 9. Particulars can be had by addressing Charles W. Landon, 263-265 Live Oak Street, Dallas, Texas. The growth of the Conservatory has been so rapid that an enlarged up-to-date building has been erected for its use.

Misses Hazel I. Waddell and Sallie G. Greene completed their course of music study at Louisburg (N. C.) Female College with a recital of which the following is the program: Capriccio Brilliant, Mendelssohn; (a) Evening Star ("Tannhauser"), Liszt; (b) Song of the Rose, Rosellen; (a) Nocturne, Op. 9, Chopin; (b) Mazurka, Leschetizky; Water Sprites, Chaminade; Polka de la Reine, Raff. Miss S. T. Williams is musical director.

At a pupils' recital at the Olivet (Mich.) Conservatory of Music, given on the evening of May 24, the following Liszt program was presented: Second Polonaise, E major Barcarolle, Schubert, Mrs. Smith; Consolation, No. 3; Waldesrauschen, Concert Etude, No. 1; Valse—de l'Opera "Faust" de Gounod; "God Keep You, Dearest." Bartlett; "Molly's Eyes," Hawley. Mrs. Smith; Erlkönig Lied von Schubert; Rhapsodie Hongrois, No. 12. An organ recital was given on May 20.

The following program was given at a recital by the advanced pupils of Miss Huse, assisted by Miss Pilat, violinist, and Miss Dressler, 'cellist, at Sing Sing, N. Y., on May 31: Brahms—Hungarian Dances; Song—Selected; Schubert-Liszt—Hark! Hark! The Lark; Masscuet—Song, Elégie; Liszt—Regata a Veniziana; Piatti—Song, Serenade; Violin Obligato; Vieuxtemps—Introduction and Polonaise; Massenet—Aria from Herodiade; Gade—Trio, Novelletten; Allegro, Andante, Moderato, Larghetto, Finale

Mr. H. Macdougall gave an organ recital at Mt. Holyoke College (Mass.) on May 17, at which he played a fine program. At Wellesley College, where Mr. Macdougall directs the musical work, a series of concerts of high class have been given. On April 29 William C. Hammond gave an organ recital, and on May 6 Leonora Jacksou, the violinist, and Selden Pratt, pianist, gave a violin and piano recital. The services in Memorial Chapel, under the direction of Mr. Macdougall, furnish some splendid music.

Pupils of Miss Carrie Delle Hosmer gave a piano recital at Athol, Mass., under the auspices of the Woman's Club, May 10. The program follows: Sonata, F minor, Op. 2, No. 1, Beethoven; Allegro, Adagio, Menuetto Allegretto, Prestissimo; Cradle Song, E Major, Op. 22, No. 3, Karganoff; Spring Song, A major, Op. 120, No. 1, Merkel; Polonaise, A major, Op. 28, Merkel; Bohemian Airs, Op. 145, Nos. 1, 2, 3, 5, Heller; Mazurka, F minor, Op. 3, No. 3, Karganoff; At the Spinning Wheel, Op. 47, Mendelssohn; Valse Arabesque, Op. 35, Saluon; Polonaise, E flat major, Op. 6, Scholtz; Spinning Song, Op. 24, No. 8, von Wilm; Valse Noble, Op. 102, No. 2, Schytte; Poetic Tone Pictures, Op. 3, Nos. 1, 2, 3, 6, Grieg; Tarantelle, D minor, Op. 82, No. 12 ("Die Fischerinnen von Procida"), Raff.

Miss Lillian Boyle gave recitals by her pupils in Fall River and Providence, R. I., June 14 and 27, at which the following numbers were played: Piano Trio—Galop, Op. 451, F. Behr; Piano Soli—(a) Musical Clock, C. Heins; (b) Waltz, Op. 23, Eilenberg; (c) Under the Blossoms, Lichner; Vocal Solo—"The Better Land," F. H. Cowen; Piano Soli (a) Nightingale, Op. 81-8, T. Kullak; (b) Love Song, Gurlitt; (c) Un Tour de Valse, Op. 98, T. Lack; Vocal Soli—(a) Winter, Op. 169-4, Lichner; (b) Barcarolle, Haberbier; (c) Butterflies, Lege; Piano Trio Geburtstags-Gavotte, F. Behr; Piano Solo—Sonatina, Op. 21-2, Krause; Vocal Solo—"He was a Prince," F. Lynes; Piano Soli—(a) Allemande, Handel; (b) Barcarolle, Op. 53-2, Haberbier; (c) Summer, Op. 169-2, Lichner; Vocal Soli—(a) "A May Morning," L. Denza; (b) "You and I," Liza Lehmann; Duo for Two Pianos—Feu Roulant, Op. 256, Duvernoy.

Mr. Harry Eugene Dibble, a pupil of Henry U. Goodwin, of Louisville, Ky., gave a piano recital recently which has called forth much praise. Mr. Dibble is a talented young man of nineteen. His program follows: Allegro Assai from Sonata "Appassionata," Beethoven; "My Sweet Repose," Schubert-Liszt; Solfeggietta, Emmanuel Bach; "Silver Spring," Mason; Vocal Solo—Valse Arietta, from "Romeo et Juliette," Gounod; Fantaisie Impromptu, Chopin; Berceuse, Chopin; Etude, G-flat—Op. 10, No. 5, Chopin; Etude, G flat—Op 25, No 9, Chopin; Ballade, A-flat—Op. 47, Chopin; Vocal Solo—(a) "Spring," Henschel; (b) "Cradle-Song," Guilmant; (c) "Les Filles de Cadix," Bizet; Concerto, C minor, Gabriel Pierne; Allegro, Scherzando, Finale (first American performance). Orchestral parts played on second piano by Mr Goodwin. He was assisted by Mrs. Cecilia Eppinghousen Bailey, soprano.

The Michigan Conservatory of Music, located at Detroit, with Alberto Jonas, the pianist, as director, has been active in musical affairs of that city and state during its short existence. Recitals by Mrs. Elsa von Grave-Jonas and Mr. Jouas, with other musical events under the direction of the school have produced good results. The program of Mrs. Grave-Jonas's fifteenth recital follows: Sonate, Op. 58, B minor, Chopin; Allegro maestoso, Scherzo-Molto vivace, Largo, Finale-Presto ma non tanto; Largo, Bach-Saint Saëns; Chant Polonais, Chopin-Liszt; Etude in D flat, Liszt; To a Waterlily, Etude de Concert, Op. 36, Edward A. MacDowell; Carnaval, Op. 9, Schumann; Préambule, Pierrot, Arlequin, Valse noble, Eusebius, Florestan, Coquette, Réplique, Papillons, Lettres dansantes, Chiarina, Chopin, Estrella, Reconnaissance, Pantalon et Colombine, Valse Allemande, Paginini, Aveu, Promenade, Pause, Marche des "Davidsbündler" contre les Philistins.

Pupils of Mr. Graham Reed, of New York, gave an excellent recital of songs and arias on May 8. The program is of general interest and is printed here: Aria—Elijah, Mendelssohn; Song—The Daily Question, Meyer-Helmund; Songs—(a) The Monotone, Cornelius; (b) Autumn Sadness, Nevin; Ballad—Rose Marie, Molloy; Songs—(a) Persian Garden, Lehmann; (b) Time Enough, Nevin; Songs—(a) Sing, Smile, Slumber, Gounod; (b) A Fairy Lullaby, Mrs. H. H. A. Beach; Song—Mattinata, Tosti; Songs—(a) Blüthen, blüthen überall, (b) Die nacht ist weich, (c) Weil auf mir, von Fielitz; Song—An Open Secret, Woodman; Songs—(a) Parting, Rics; (b) Drink to Me Only with Thine Eyes, Old English; Song—Appear, Love, at Thy Window, Gregh; Songs—(a) I Attempt from Love's Sickness to Fly, Purcell; (b) My Marguerite, Old French; Songs—(a) The Sweetest Flower that Blows, Van der Stucken; (b) Dans le Sentier, Massenet; Songs—(a) Ihr bild, Schubert; (b) The Ring, Chopin; (c) My Love is Like a Red, Red Rose, Brandeis.

The graduating exercises of the Strassberger Conservatory of Music, St. Louis, Mo., were held at the Odeon on the evening of June 18. Diplomas of three degrees in teacher's course were awarded. The program was awarded as follows: Weber—"Jubel Ouverture," Quartet for two pianos (eight hands); Mozart—Piano Concerto, in A major, first movement, with string quintet, piano and organ accompaniment; Torry—"Spring-time," Italian Aria, Soprano Solo; Chopin—"Ballade" in G minor, Op. 23, Piano Solo; Wieniawski—"Russian Airs," Violin Solo; Meyerbeer—"Coronation March," Duet for two pianos (four hands); Mozart—Piano Concerto, in A major, last movement, with string quintet, piano and organ accompaniment; Nevin—(I) "Before the day break," (English); Schumann—(II) "Der Nussbaum," (German); Woodman—(III) "An Open Secret," (English), Soprano Solos; Liszt—"Tarantella," No. III from Venezia e Napoli, Piano Solo; Bauersachs—(I) "Adaglo," Sarasate—(II) "Zigeuner Weisen," Violin Solos; Mendelssohn—Piano Concerto, in D minor, Op. 40, first movement, with string quintet, piano and organ accompaniment; Statistical Report—Rev. W. W. Boyd, D. D.; Presenting Awards—C. C. Strassberger.

Mr. Edgar S. Fisher, teacher of violin at Whitman College Conservatory of Music (place not named), gave a fine violin recital on May 17. The program follows: I. Sonata—Piano and Violin—A major, Op. 100, Brahms; (a) Allegro Amabile, A major; (b) Andante Tranquillo, F major, D major; Vivace, D minor, F major; (c) Allegretto Grazioso, A major. II. Zigeunerlieder (Gipsy Songs), Op. 103, Brahms; (a) Allegro Agitato, A minor; (b) Allegro Molto, D minor; (c) Allegretto Allegro, D major; (d) Vivace Grazioso, F major; (e) Allegro Giocoso, D major; (f) Vivace Grazioso, G major. III. Violin—Adagio and Fugue, G minor, Bach. IV. Zigeunermelodien, Op. 55, Dvorak; (a) Moderato, G minor; (b) Allegro, G minor; (c) Moderato, B flat major; (d) Andante con Moto, D major; (e) Allegretto, D minor; (f) Poco Allegro, F major; (g) Allegro, D minor. V. Violin—Symphonie Espagnole, Op. 21, Lalo; (a) Allegro non troppo, D minor; (b) Scherzando, G major; (c) Adagio, D minor; (d) Rondo Allegro, D major. An excellent concert by pupils of the institution was given in April, as well as a concert by the faculty under the auspices of the Ladies' Musical Club of the place. This program is as printed: I. Sonata—Piano and Violin, Op. 121, D minor, Schumann; (a) Ziemlich langsam (introduction); Lebhaft (allegro); (b) Schriebhaft (Scherzo); (c) Leise, einfach (Andante); (d) Bewegt (Molto Allegro). II. Scene and Arie, "Der Freischutz"; "Wir mahte mir der Schlummer," Weber. III. Adagio and Fugue, Sonata No. 1, G minor, Bach. IV. Lied, "Die Lorelei," "Ich weiss nicht," Liszt. V. Etude, C major, Rubinstein. VI. Songs: (a) "In Lonely Wood, Op. 85, No. 6, Brahms; (b) "Like a Blossoming Lilac," Op. 63, Brahms; (c) "For All Eternity" (with violin obligato). Mascheroni. VII. Symphonie Espagnole, Op. 21, Lalo; (a) Allegro non troppo; (b) Andante; (c) Rondo.

AT HOME.

Mr. W. E. Fairclough gave an organ recital at Toronto, Canada, May 7.

The Bedford Piano Club gave a musicale on June 11, at which an attractive program was presented.

The first performance (from MS.) of Hezekiah, an oratorio by J. Truman Wolcott, of London, Ont., Can., was had April 18.

Miss Marie Schade, a successful pianist of Copenhagen, Denmark, will make a tour of this country during the season 1901-2.

Attractive music marks the services of the Second Presbyterian Church, of Detroit, Mich., of which E. R. McGlasham is organist and choir director.

Mr. Charles V. Kleintop, assisted by two of his pupils, gave a recital in the First Presbyterian Church of Lehighton, Pa., May 11. The program included music for organ, violin and piano.

Mr. Hamlin H. Hunt, of Minneapolis, Minn., gave an organ recital in that city April 24. He was assisted by W. S. Woodworth, baritone. Mr. Hamlin plays at the Pan-American Exposition August 1, 2 and 3.

Mr. Frank M. Church, organist of the First Presbyterian Church, of Augusta, Ga., gave a successful organ recital on May 9. His program was made up of real organ music. A recent Church service shows the use of excellent music.

Mr. S. Becker von Grnbill has completed his second Southern tour of this season. In June he played in Syracuse and Buffalo, New York. His program of unpublished works of Beethoven, Chopin, Schumann, Schubert and de Kontski has made a decided sensation among musicians.

Mr. William J. Hall, assisted by Miss Beatrice Pickthall, gave a series of "Short Talks" on Famous Composers, with vocal and instrumental illustrations, at St. Paul, Minn., on May 6, 13, 20, 27. The subjects were Wagner, Tschaikowsky, MacDowell and Dvorak. The pianola and aeolian were used in instrumental illustrations.

A string quartette has been organized in Fort Wayne, Indiana, which will confine its study to the rendition of a large classical repertoire of which it is the fortunate possessor. The personnel is as follows: Anton Sporl, formerly of Vienna, Austria, first violin; Herbert Patton, of the faculty of a local Conservatory, second violin; Charles Hauck, son of a prominent organist, viola; Edward Noll, of the Leipzig Conservatory, 'cello. The club will be known as the Franz Schubert String Quartette.

A May festival was given at Dubuque, Iowa, under the direction of W. H. Pontius, at which Goring Thomas' "The Swan and the Skylark," Mendelssohn's "Elijah" and a miscellaneous program were presented. The musical forces included the Chicago Symphony Orchestra, Mme. Eleanore Meredith, soprano; Miss Mabelle Crawford, contralto; Mrs. Clara Murray, harpist; Mr. E. C. Towne, tenor; Mr. Holmes Cowper, tenor; Mr. Charles W. Clark, baritone; Mr. Herbert Butler, violinist; Mr. Franz Wagner, 'cellist, and a festival chorus of 100 voices.

Mr. Emil Liebling gave a recital at Mollere, Ill., on May 11. He was assisted by Mrs. Alice Dutton in the following program: Prelude, Op. 10, MacDowell; Magic Fire Scene, Wagner; Sonate, Op. 31, No. 2, Beethoven; Spring Song, Serenata, Gavotte Moderne, E. Liebling; Nocturne, Op. 37, No. 2, Chopin; Pan's Flute, Godard; Etude de Concerte, Schytte; Children's Dance, Westerhout; Concert Waltz, Moszkowski; Larghetto from Concerto, Op. 16, Henselt; Gavotte, Op. 38, Rubinstein; Concerto in E major, Op. 59, Moszkowski; Moderato; Andante and Scherzo; Allegro Deciso.

In order to correct certain rumors the officers of the Manuscript Society, of New York, wish to assert positively that the society has not closed its career, but is still in existence with definite purposes for next season, which will continue it as an important factor in the musical life of the country and justify the interest of all American musicians in its musical work. It is undeniable that there is ample room for an organization of the purposes and objects which the society has always kept in view, in spite of some reverses, viz.: To foster the interests of American musicians, to perform their manuscript works, when worthy of a hearing, and to bring musicians, both of this city and the country, generally, into closer friendship and association.

On the evening of April 25th Lyman Hinsdale Sherwood, one of the best known and most generally respected citizens of Lyons, N. Y., passed peacefully out of this life at his home on Queen street. He was a pioneer in musical work in this country, and his Lyons Musical Academy, founded in 1854, quickly became one of the best known institutions of its kind in this country, occupying the same position in relation to the musical education of its day as that occupied by the Boston Conservatory at the present time. Pupils were attracted to the Lyons Academy from all over the country and so great became the reputation of this school that it enlisted the attention of musical instructors in many of the great cities, and a delegation from Boston visited Lyons for the purpose of inducing Mr. Sherwood to remove his academy to that city. This he was not inclined to do and the growing demand for such a school as this later on led to the establishment of the Boston Conservatory of Music. He was the father of William H. Sherwood, the eminent pianist.

PUBLISHER'S COLUMN.

The music supplement of this number contains eight pieces, retailing at from 20 cts. to 50 cts. per copy in sheet-music form, amounting to a total value of $2.25. Here are the eight selections: Rickaby, T. L. A Song of Her Love (Vocal), D, d-f, 50c. A melodious song in which the change of key and rhythm are artistically treated. Sudds, W. F. Op. 269. The Red Fez Parade. March. Grade III, 50c. Descriptive of gradual approach; pleasing and striking. Wachs, P. Song of Jeannette. Song Without Words. Grade III, 35c. In style of the French *Chanson*, furnishing pretty practice in melody playing with light staccato accompaniment. Allen, A. The Organ Man Plays. Grade II, 25c. Odd little scherzando—brimful of interest. Hiller, M. P. Op. 6, No. 3. On the Playground. Grade I, 20c. Pleasing rondo introducing a mild form of syncopated accent. Without octaves. Engelmann, H. Op. 414. Bagatelle. Grade III., 35c. Brilliancy and grace are the predominating features of this excellent solo. Kirchner, F. Op. 116, No. 1. Little Red Riding Hood. Grade III, 30c. Descriptive composition in which the themes of the maiden and the wolf are delightfully contrasted. Clarke, W. H. Short Service Prelude for Organ, No. 3. 20c. Fully described in the pages devoted to the organ department.

***

The June issue of THE MUSICIAN contains a full report of the Bach festival at Bethlehem, Pa. That report is supplemented in this number by an exceedingly interesting discussion of the "Interpretation of Bach." Mr. Law, the writer of the article, has taken great pains to authenticate his statements and the result is an authoritative article that cannot fail to be of immense value. This midsummer number is filled with other matter well suited to the season. There is instruction and entertainment. The teacher or student who is enjoying a rest can gather good from THE MUSICIAN without over-effort.

***

Our Latest Publications are both practical and useful. "Modern Foundation Studies" and "Modern Studies in Phrasing and Interpretation," both by W. F. Sudds, are the outcome of the author's experience of many years' teaching, and young teachers should give them the careful attention they deserve. "Fingering," by Gordon Saunders, is a comprehensive and extended work in this important branch of piano playing. The author's treatment of the subject, illustrated by extracts from the works of celebrated authorities on pianistic art, is practical, clear and pointed.

Other important works are in preparation. Our aim is to publish and supply the BEST, and our success in obtaining and holding trade is evidence that we are tending in the right direction.

***

The Musician's Premium List. This list, made up of musical works and articles needed by all musicians—students as well as teachers—offers some remarkable inducements. With but little effort, each of our subscribers can secure one or more new subscriptions, and we offer liberal premiums for any interest they may take in extending the circulation of this journal. Send for the list, and build up a library of choice musical works without the expenditure of any money.

***

If you are not satisfied with the way in which your orders have been filled by other dealers, why not give us a trial, and test our ability? Our facilities for promptly filling all orders are unequalled by any house in America. We carry a complete line of all foreign and American publications. We are large publishers—are rapidly building up a catalogue of sheet music and music books that cannot fail to interest teachers, because each subject has been selected on account of its teaching value.

***

Our Publications are noted for correctness and beauty. We carry a complete line of all Foreign and American publications. Our facilities for promptly filling all orders are unequalled.

Our *Special Novelty Offer*—an original plan by which you can obtain one copy each of our new sheet music publications at nominal cost—will interest you. Full particulars will be sent upon application.

***

Readers of THE MUSICIAN who desire to keep posted upon all new publications of merit, should carefully read the advertising columns of THE MUSICIAN, from which they can secure much valuable information. Any of these publications can be procured through us at the least possible cost.

As a representative or agent of The Musician, vacation season can be made profitable. It makes no difference whether vacation is spent at home, in the country, in the mountains, or at the seashore, musicians—professional and amateur, teachers and students—will be found at all places. While THE MUSICIAN has a very large and constantly increasing circulation, nevertheless this is an immense country and our journal is known to only a small percentage of those who should be acquainted with it and the good work which it is doing. An hour or two each day, devoted to soliciting subscriptions, will pay. We have agents who give only a portion of their time to the work and they obtain from 30 to 40 new subscribers each week. THE MUSICIAN appeals to all who are interested in music, to the student as well as the teacher, and it is an easy matter to take subscriptions. Its price is another consideration. $1.50 per year is a trifling amount for twelve numbers of a journal which contains 288 pages of sheet music and 480 pages of musical literature, of a high order of excellence. The quality, as well as the quantity, of matter, is unequalled by any similar publication. Sample copies, order blanks, receipts, full particulars regarding commissions, and all other information will be promptly furnished those who wish to act as agents.

***

Wants.—The time is at hand when it will be necessary to make plans for next season. Teachers who desire to make changes, and schools and colleges needing new or additional help, should take advantage of the *Want Column* of THE MUSICIAN. Wants not exceeding five lines are inserted free, and but a nominal charge is made for advertisements exceeding this limit.

As much space as may be needed to help its readers secure positions or obtain help will be used.

***

Vacation season affords teachers a splendid opportunity to map out the course of study for the coming season, to decide upon the studies to be used and to make up, for convenient reference, lists of the most suitable teaching pieces of all grades. It is a wise precaution to have all of this preparatory work completed prior to the beginning of the teaching season, when routine duties occupy all available time. Our Descriptive Catalogue—new and enlarged edition—ready this month, will prove a valuable aid in this preparatory work. Copies will be sent to any address.

***

Before deciding on your dealer for next year's supplies, write for our new catalogues and best discounts. Compare the latter with those offered by others; note the liberal conditions under which we send selections of music "on sale." They will interest you. During the Summer months we will be preparing many new and excellent subjects, and our selections will contain a splendid variety of all grades. Write for further particulars. Glad to hear from you.

***

Music on Sale for the Summer Months.—With many teachers the summer months are the busiest of the year. We supply selections of music for use during these months, and returns need not be made until October 1st. A majority of publishers object to sending music "on sale" during the summer, hence our offer may be appreciated. Complete catalogue from which you can make up your own selection, if you prefer to do so, will be sent upon request, or we will make the selection on receipt of information as to as to number of pupils, grades, style of music desired, etc.

***

Are You Certain that you are buying your music at as good rates of discount as your fellow teachers? If not, you are doing business at a *disadvantage*. *We claim* that the discounts we allow teachers are MUCH BETTER than offered by other dealers, and unless you have had our latest quotations, you *cannot* be sure that you are not paying *more* for your supplies. This applies not only to our own publications, but to ALL the music you use. On our own publications we offer such liberal discounts (which will be supplied on request) that, no matter how far distant you are, or the cost of Postage or Express, we GUARANTEE you a saving when purchasing from us. In this connection you should remember that we send liberal selections of the latest and most desirable music "ON SALE," with the privilege of returning and having credited, at the end of the teaching season, all that has not been sold or used. Full particulars regarding this department of our business may be had on request. We also offer numerous additional advantages which it is impossible to mention in the limited space of this page. *Write us!* No trouble to answer your letters and inquiries. It will pay you to correspond with a house that is progressive and up-to-date in all of its dealings. We can save you time, trouble and money. We suggest that you give us an opportunity to demonstrate this fact by sending us a trial order, it will bring us your steady patronage.

NEW PUBLICATIONS.

Allen, A. Menuet. Grade II, . . . 25
Simple and pleasing melody, with bass in single notes.

Allen, A. Slumber Song. Grade II, . . . 25
Pretty effect is obtained by contrast of power in its various parts.

Döring, H. Under the Christmas Tree (Unterm Christbaum). Descriptive Piece. Grade I, ... 25
Pretty sketch all in treble clef; double notes in right hand, single notes in left.

Eilenberg, R. Op. 189. Enchantment (Herzensdieb). Tone Piece. Grade III, . 35
Full of grace and beauty.

Heins, C. Op. 213. Dancing (The) Girl (Die Tänzerin). Grade III, ... 40
Brilliant concert waltz; not difficult.

Horvath, G. Op. 21, No. 5. Polka Mazurka. Grade II. 25
The distinctive features of this pretty movement are delightfully portrayed.

Horvath, G. Op. 21, No. 1. Polonaise. Grade II, ... 50
Interesting as a recreation and valuable as a study. Revised and fingered by Thos. a'Becket.

Kienzl, W. Op. 51, No. 3. Carnival Ländler. Grade III, ... 30
Beautiful tone poem, introducing effective left hand solo.

Lebierre, O. Op. 31. Pretty (The) Lace-maker. Bluette. Grade III, ... 35
Crisp, bright movement; nice study of touch.

Oesten, M. Op. 122. Story of the Fairies (Elfenmärchen). Melodic Etude. Grade IV, ... 50
Graceful and brilliant; an extremely interesting solo.

Sartorio, A. Op. 345. Hunting Idyl (Jagd-Idylle). Grade III, ... 35
Brisk, spirited descriptive composition.

Schmidt, O. Op. 47. Valse de Salon. Grade IV, ... 40
Brilliant concert solo, with melodious introduction.

Schneider, H. Op. 25. Mill (The) at Sans Souci (Die Mühle von Sanssouci). Grade III, ... 35
Interesting character study; varied themes.

Sternberg, M. Op. 4. Shepherd's (The) Serenade (Senners Abendständchen). Grade III, ... 35
Pleasant Tyrolean melody, largely in thirds and sixths.

Székely, I. Return to the Meadow (Wiedersehen der Haide). Grade IV, ... 40
Unique study of repeated notes with varying accents.

Wilm, N. von. Op. 8, No. 1. Berceuse. Grade III, ... 30
The simple beauty of this lullaby is exquisite.

Wilm, N. von. Op. 8, No. 2. Mazurka. Grade III, ... 30
A great favorite; deservedly successful.

Wilm, N. von. Op. 24, No. 7. Rustic Dance (Ländlicher Tanz). Grade III, . 25
Bagatelle of graceful proportion and melodic beauty.

THE MUSICIAN *wants to keep in close touch* with teachers and schools in all sections, and the editor believes that space devoted to reports of concerts, recitals, lectures on musical subjects and musical events of general interest would prove interesting to readers. You can aid him in making an interesting feature of this department by sending reports of musical happenings that will interest your fellow teachers in other localities.

***

Agents Wanted.—THE MUSICIAN wants good, live representatives to solicit subscriptions. Those having a knowledge of music preferred. Full particulars, including sample copies, order blanks, other helps and terms, will be sent to all who desire to make a trial of this work. No other field of subscription work offers such liberal inducements.

***

Our Offer to send a complete set—seven grades—of the "National Graded Course" (together with a specially prepared pamphlet entitled: "Hints for Obtaining the Best Results in Using the National Graded Course") subject to examination and approval, without any obligation to purchase, is still open. Hundreds of teachers and schools, now exclusively using this Course, became acquainted with its merits by taking advantage of our offer. It bears examination, and the longer it is used, the better it is liked. The "National" is gradually taking the place of other works, and is rapidly becoming the standard method of instruction for the piano. Why not allow us to send you a complete set (seven numbers), so that you may carefully examine the works during vacation. We are confident that it will please you, and that you will conclude to use it—that's our experience with all teachers and schools to whom it has been sent for examination, and comparison with other courses.

SEND TO THE PUBLISHERS OF THE MUSICIAN FOR ANYTHING NEEDED IN MUSIC.

A SELECTED LIST OF

FIFTY FIRST GRADE PIECES

FOR

TEACHING AND RECREATION.

Any of our publications sent subject to examination. Complete Illustrated and Thematic Catalogue free on application. Send for our Special Prices. Mail Order Business Solicited.

BEHR, F.

Op. 503, No. 30. Au Revoir (Auf Wiedersehn) 20
A tender little melody, which sings out its good-bye hopefully. Requires a loose, quiet wrist and singing legato finger touch.

Op. 508, No. 18. Bird's Message (Vogleins Botschaft) 20
This makes somewhat greater demands on the player. Its bird imitation makes use of the added lines, which must be read quickly. A light wrist and flexible fingers are needed.

Op. 426, No. 1. Congratulation (Glückwunsch) 20
These congratulations are hearty and the piece should be played sturdily, but with no tendency toward hardness of touch. It is a useful teaching piece.

Ethel Polka 20
A sprightly little dance, bright in melody and easy in accompaniment. A good study in wrist touch and staccato.

Op. 575, No. 23. Farewell to Home (Abschied von der Heimath) 20
Somewhat similar in nature to Au Revoir, but more difficult. It is very pretty and sure to please the pupil.

Op. 575, No. 1. French Child's Song (Französisches Kinderliedchen) 20
A quite easy first piece with a good tune to it. It is entirely in position.

Grandpapa's Dance (Grossvater's Tänzchen) 20
Grandpapa must be a jolly old fellow, for his dance is quite gay. Another good exercise in wrist staccato.

Op. 575, No 2. In the Month of May (Im Mai) 20
A song of spring, bright and tuneful. It is a good first piece.

Op. 426, No. 5 Italian Song (Italienisches Lied) 20
This requires more musical perception from the pupil and, given at proper time, will be a good study in phrasing. The reiterated chords in left hand must be watched.

Kindergarten Waltz 20
A very graceful waltz, not hard to play, but pleasing. Should be carefully phrased.

Night in May (Mainacht) 20
This is a splendid piece for teaching purposes. It is clear in form, interesting in treatment and attractive in melody and harmony.

Night Patrol (Nächtliche Runde) 20
A good staccato is demanded in this piece. Its martial character is pronounced. Bright and interesting.

Parade of the Guard (Wachtparade) 20
Somewhat similar to the preceding, but more lively. Partakes more of the character of the two-step. We can easily imagine the guard swinging by at double quick.

Op 426, No. 3. Star Greeting (Sternengruss) 20
Of quite different style. Phrases are well marked and a smooth, singing legato is necessary in both hands.

BIEHL, A.

Op. 53, No. 2. Dance on the Lawn (Tänzchen im Freien) 20
This dance shows the frisky disposition of the dancers. It is not difficult, but pleasing.

Op. 52, No 14. The Clock (Die Wanduhr) 20
Very characteristic. The left hand adds much to the effect and should be well played.

Op. 53, No. 7. Garland Weaving (Beim Kränzewinden) 20
A beautiful little piece. The second part makes some demands upon the left hand. Well worth study.

Op. 52, No. 15. Little Soldiers' March (Kleiner Soldaten Marsch) 20
An attractive study in chord playing in left hand, with a good tune in the right. Not hard, but pleasing.

Op. 52, No. 10 Picnic Dance 20
Exemplifies its name. A jolly dance, such as happy picnicers would indulge in. Good teaching piece.

Op. 53, No. 1. Wild Rider (Der Wilde Reiter) 20
A good descriptive piece, requiring firm touch and light wrists and arms. Good study.

BOLCK, O.

Op. 68, No. 1. Weaving Garlands (Beim Kränzewinden) 20
A very tuneful melody with broken chord accompaniment. Attractive without undue difficulty.

ENGELMANN, H.

Op. 408, No. 4. Humpty Dumpty Schottische 25
A brisk Schottische. Like all of Engelmann's pieces, it is full of melody and interestingly harmonized.

Op. 422, No. 3 King's Delight Mazurka 25
A characteristic Mazurka by same author. Good practice in phrasing. Not difficult.

Op. 408, No. 5. Little Boy Blue March 25
A good march. Excellent practice in wrist touch. Sure to please.

Op. 408, No. 1. Mother Hubbard Waltz 25
A graceful waltz, no hard places to discourage the young player.

Op. 422, No. 5. Old King Cole's March 25
A bright piece, good for teaching purposes and sure to interest the pupil.

Op. 422, No. 1. Start Up Waltz 25
Sure to start the pupil to practicing it with vigor. It is easy, bright and jolly.

GOERDELER, R.

Lullaby 25
A beautiful melody which gives opportunity for cultivating a singing tone. Very interesting.

Merry-Go-Round 25
A joyous little piece. Phrases are well defined, and will aid the pupil in understanding simple form.

Sweet Evelyn Waltz 25
An attractive little waltz of no particular difficulty. Melody of first part is in left hand. Effect of tie is good.

GURLITT, C.

Op. 130, No. 6. March of the Tin Soldiers (Zinnsoldaten Marsch) 20
Melody is given out by right hand and is then repeated in left. In six-eight measure. Very good.

HELLER, M. P.

Op. 6, No. 3. On the Playground (Auf dem Spielplatz) 20
A good study piece. The slurs give practice in lifting hand after binding two notes. A contrasted legato melody in second part should be carefully played.

HILLER, P.

Op 66, No. 2. Grandmother's Dream 20
An excellent study piece. Its subjects are well contrasted and the work is evenly distributed.

Op. 66, No. 3 Lonely Rose 20
In the minor. The loneliness of the flower is told quite well. A singing legato and a chance for expression are its distinguishing features.

KÖHLER, L.

Op. 210, No. 4. At Home (Am Gemüthlichen Plätzchen) 20
Quiet contentment characterizes this little piece.

KÜGELE, R.

Doll's Dance (Puppentanz) 20
There must be lively dolls, for this dance is full of go. Beside being a good teaching piece, it is sure to please.

LANGE, G.

Op. 249, No. 1. In Rank and File 35
Erect and vigorous these soldiers march by. Occasionally the roll of the drum is heard. Not difficult.

LICHNER, H.

Op. 78, No. 4. First Ball. Rondino 35
Some good finger work can be gotten from this piece, which is tuneful and gay. A crisp staccato is necessary also.

Op. 57, No. 3. Twinkling Feet Waltz 20
Simple and free from catchy places, this waltz is nevertheless very attractive. If played daintily, it is very characteristic.

MERKEL, G.

Op. 31, No. 1. Children's March (Kindermarsch) 20
Short, but it is full of music. It should be played with decision.

PRIDHAM, J.

Fairies' Waltz 30
Its two subjects require somewhat different treatment. The first, a quiet hand and firm finger touch. The second, a light wrist touch changing to a finger touch for the runs. Very bright and pleasing.

REINECKE, C.

Op. 107, No. 12. Children and Cuckoo (Kinder und Kukuk) 20
The children's song and the call of the cuckoo are heard here. The children at times break off their song to imitate the bird. Instructive as well as pleasing.

RUMMEL, J.

March 20
A good example of this form. Bright and effective.

SARTORIO, A.

Op. 229, No. 7. Dreams of Youth (Jugendträume). Polka Mazurka 20
Good practice in dotted-eighth and sixteenth rhythm, and in double notes. Tuneful and without hard places.

Op. 229, No. 2. Italian Song (Italienisches Liedchen). Barcarolle 20
A singing melody with a broken chord accompaniment. Excellent practice in phrasing.

Op. 229, No. 3. Military March (Militair Marsch) 20
A good march somewhat more difficult than those before mentioned. Well controlled arms and hands are needed. Results will be good.

SCHUMANN, R.

Op. 68, No. 10. Happy Peasant (Fröhlicher Landmann) 20
Too well known to need comment. With it is a Hunting Song, which is an excellent companion.

THOMÉ, F.

Melodie 20
A very beautiful piece. Its exquisite melody should be played with a full singing legato. The first bass note of each measure is staccato, making a peculiarly effective accompaniment.

WOLFF, G. T.

Op. 25, No. 11. Mill by the Brook (Mühle am Bache) 20
Brisk and characteristic. The clatter of the mill is given first with the right, then with the left hand.

WOOLER, A.

Golden Sunset 25
Especially useful for the running work in left hand. Very pleasing.

Published by **HATCH MUSIC COMPANY**, Philadelphia.

CHOICE NUMBERS FROM THE "Hatch Edition"

Diminished reproduction of cover plate used on the "Hatch Edition."

All numbers included in this list have been carefully edited and annotated by leading American teachers our corps of editors including: W. S. B Mathews, Wm. H Sherwood, Frank H. Tubbs, Frederic W. Root, R. S. Goldbeck, Jaroslaw de Zielinski, J. S. Van Cleve, Thos. a'Becket, Wilson G. Smith, H. C. Macdougall, Bernhard Listemann, etc. This important work has never been attempted by any other publisher. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Regardless of the additional expense involved in the publication of annotated editions, prices have not been advanced, but are the same as those charged for ordinary reprints of the works included in this list.

No. 28. BURGMÜLLER. Op. 100. Twenty-five Easy Studies for the Pianoforte 1 00
Revised, fingered and annotated by Jaroslaw de Zielinski.

No. 29. CHOPIN. Nocturnes for the Pianoforte 75

Herve D. Wilkins
Arthur L. Manchester

GRADE 1.

The Corner Stone of the Course.

Table Exercises; Instructions from the Very Beginning, Most Carefully Graded; Difficultics Introduced in Logical Order; Interesting Exercises and Etudes; No Octaves; Exercises for Free Wrist; Major Scales—*Written*, but *not* Played.

GRADE 2.

Introduction of Scale Playing: Exercises for Passing Under the Thumb; Minor Scales Written; Beginning of Arpeggio Work (Broken Chords); Major and Minor Chords Awakening of the Ideal of the Singing Touch; Interesting Etudes; Careful Grading of Difficulties.

The Preparatory Gymnastic Exercises, in Grade 8, are Practical and Helpful.

GRADE 3.

Velocity Assumes Some Importance; Attention Given to the Staccato, while Cantabile Playing Is Carried Aloug with Equal Care; Etudes Become More Like Pieces; Polyphonic Playing Introduced; Exercises for Weak Fingers in Each Hand.

GRADE 4.

Polyphonic Playing Carried Forward; Rhythmical Problems (Two Against Three) Introduced; Greater Richness in the Etudes; Etudes for Melody Playing, Rapid Runs, Trills, Arpeggi, Marked Rhythms, Extreme Agility, Fourth and Fifth Fingers Interest Maintained Throughout the Grade.

GRADE 5.

Musical Material of Great Beauty; Etudes for Left Hand, Octaves, Polyphonic Playiug, Staccato, Double Notes, Grand Arpeggi, Fourth and Fifth Fingers. In Singing Tone, Touch, Velocity and General Intelligence, Much More is Demanded of the Pupil.

GRADE 6.

Etudes for Extended Finger Touches, Staccato, Doubl Notes, Extreme Rapidity in Staccato and Runs; More Attention Given to Octaves; Pupil's Task Steadily Increasing in Difficulty—Greater Requirements in Regard to Touch, Interpretation, Color and Phrasing.

GRADE 7.

Pieces and Etudes by Saint-Saëns, Henselt, Kullak, Chopin, Mendelssohn, Raff, Alkan and others. These, Making Greater Demands upon the Pupil, advance his Technical Skill to the Highest Efficiency and Insure Ability to Interpret the Greatest Works for the Piano.

Several Opinions.

WILLIAM H. SHERWOOD: I am happy to state that the "National Graded Course" is remarkably adapted to the needs of teachers and students of music. Your claim in regard to the excellent grading of the studies is a thoroughly just one. I do not think that I have ever seen as good a succession of topics and exercises arranged as they are from the beginning on, using the best kind of materials from all sources and without any superfluous pages.

WILSON G. SMITH: I have been particularly impressed with the practical value and uniform excellence of the "National Graded Course."

AD. M. FOERSTER: The "National Graded Course" is destined to hold a foremost position among the works of its class. I do not know of a better work, one containing a more interesting and valuable selection of studies and pieces for the various peculiarities to be mastered. A list of desirable pieces that may be added to each part, if found necessary, is given in each grade, also definitions of all musical terms used in this work. The work is bound to find favor with thoughtful teachers and students.

O. R. SKINNER: I like the "National Graded Course" much better than any other work I am familiar with. The editing seems to be thoroughly well done, and the print leaves nothing to be desired.

(Want of space alone prevents printing the opinions of hundreds of well-known teachers in all sections of the United States and Canada.)

It Will Help YOU in Your Teaching.

Because

- It embodies the work of the most eminent pianists and teachers in America.
- It can be readily adapted to your "method," no matter what that may be.
- It is the LATEST work of the kind.
- ALL of the studies are carefully annotated, fingered and edited.
- It is the most carefully graded of any course before the public.
- It begins at the beginning of study.
- It saves the time that otherwise would be spent in laborious and often unrewarded search after that which is good and up-to-date.
- It covers the entire field of piano literature in an eminently practical, interesting and stimulating manner.
- Hundreds of your fellow teachers from all parts of the country have sent us, unsolicited, enthusiastic commendations of these very features.

This complete work (7 grades) together with a specially prepared pamphlet entitled: "Hints for Obtaining the Best Results in Using the National Graded Course." will be sent upon request, subject to examination and approval—without any obligation to purchase.

Seven Grades. Price, Each Grade, $1.00

Sieber's 36 Elementary Vocalises

Op. 92-97 Inclusive

FOR SOPRANO, MEZZO SOPRANO, ALTO, TENOR, BARITONE AND BASS

With Introductory Notes by FREDERIC W. ROOT.

Sieber's 36 Eight Measure Vocalises, for all voices, are well known and appreciated by teachers. The composer had a double object in view and prepared them for use in the school, as well as for self-study at home. The book for each voice differs from the companion volumes, as the exercises were written with especial regard for the voice part under consideration. Each study is contained within eight bars—therefore do not become tedious—and are written with the *sol fa* syllables, also with an ingenious and effective set of vowel sounds designed by the composer, who is a teacher of European celebrity. All of his studies are melodious and interesting.

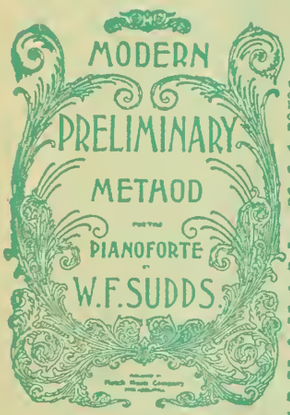
Our new edition is, in every respect, the finest in print. These studies have, heretofore, been published only in sheet music form, at $1 50 each. While our new edition is of much more convenient size and much handsomer in every way, it is sold for 50 cents per copy.

Mr. Frederic W Root says: "The new edition of Sieber's Exercises are beautifully gotten out and I hope will be properly appreciated. I congratulate you upon the edition and hope to use it in my teaching for many a year."

Paper Binding. Price, 50c. Each.

MODERN PRELIMINARY METHOD

FOR THE PIANOFORTE



Embodying the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation

By W. F. SUDDS.

As its title implies, this Method is modern, contains the newest ideas and their practical application. The bulky and voluminous instruction book is a thing of the past. The Method of to-day deals with more subjects than its predecessors, but deals with them in a terse and effective manner. It recognizes the importance of practical exemplification of the principles involved, but wisely leaves the amplification of various points to future study.

Among the many excellent features of the Modern Preliminary Method, we direct attention to the following:

The Rudiments are very progressive and explained with such clearness that the pupil cannot fail to comprehend them.

The Various Touches are clearly set forth and are accompanied by illustrations, drawn and engraved expressly for this work, showing the movements of finger, hand and arm.

The Correct Principles of Touch and Technic are illustrated by examples.

The Scales are introduced in an effective manner.

Proper Use of the Pedals, a matter generally disregarded, is given particular attention.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

Five-finger Exercises are judiciously used, but not in the usual enormous quantity that disgusts and discourages the pupil.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a Complete Preliminary Method—a work which cannot fail to interest both the practical teacher and the earnest student.

MODERN PRELIMINARY METHOD is the result of many years' experience as a teacher, by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates on the best grade of music book paper.

Half Cloth Binding. Price, $1.00.

THE HARMONIZING OF MELODIES

A Text Book for Students and Teachers

By HENRY C. BANISTER.

The harmonizing of melodies, generally termed the knowledge of harmony, is one of the most practical applications of the knowledge of chords and their treatment. One may know the meaning of a number of words and still be unable to construct a sentence; he who lacks the ability to use chords in harmonizing a melody is in a similar position.

"Harmonizing of Melodies" will prove a most helpful aid to the student of harmony. It is extremely practical and abounds in examples which will readily be understood. No point has been overlooked, and all important subjects are treated at considerable length. Various methods of handling the same melody are shown, and valuable information as to the best choice, with reasons for the selection, are given. Many excellent hints as to taste and ornamentation, culled from the experience of the writer, are included.

Paper Binding. Price, 50 Cents.

BURROWES' PIANOFORTE PRIMER

Latest Improved Edition

Revised and Modernized by THOS. A'BECKET.

The fundamental principles which have given the work a world-wide reputation were not disturbed in the revision, but as the method of instruction has improved more rapidly than any other portion of the musical art, the sole aim of the editor was directed to bringing it up to the requirements of a progressive age.

There are other editions of this work—a number of them—but none are equal to the Latest Improved Edition, although all are sold at the same price.

Half Cloth Binding. Price, 25 Cents.

BUSSLER'S PRACTICAL HARMONY

Newly Revised and Corrected Edition

Authorized Translation from the Third German Edition by N. GANS.

Without exception, the best and most practical work on this subject ever published. The author is a noted German theorist, whose works are known, used and held in high esteem at all the most prominent European colleges and conservatories. The demand for PRACTICAL HARMONY has been so great that three revised editions have been printed in Germany. Ours was translated from the third German edition, by a writer selected by the author. It is, as its title indicates, a thoroughly practical work, embracing the latest and most approved methods. It is simple, is illustrated by practical examples, and is eminently suited for a self-instructor, for its price brings it within the reach of all.

For class instruction or for self instruction, Bussler's Practical Harmony is unequalled. It makes the study of harmony easy, rapid and entertaining.

Cloth Binding. Price, $1.00.

JOUSSE'S MUSICAL CATECHISM

Latest Improved Edition

Revised and Modernized by THOS. A'BECKET.

No one questions the merit of Jousse's Catechism—it is a universal favorite; but the progressive teacher demands text books and studies of the most advanced character. He is not satisfied with original editions, but wants the latest and best ideas. The possession of up-to-date editions saves time and insures more rapid and more substantial progress.

There are other editions of this work—a number of them—but none are equal to the Latest Improved Edition, although all are sold at the same price.

Paper Binding. Price, 20 Cents. Half Cloth Binding. Price, 30 Cents.

Musical Memory and its Cultivation

Also an Investigation into the Forms Of Memory Employed in Pianoforte Playing and a Theory as to the Relative Extent of the Employment of Such Forms

By FREDERICK G. SHINN, Mus. Doc., Dunelm.

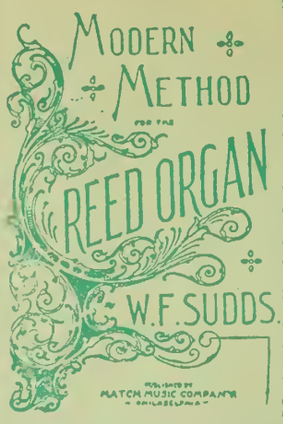
The purpose of the work is twofold. *First*, an inquiry into the various forms of memory employed in piano playing and the formation of a theory with regard to the relative extent of the employment of the various forms by different individuals. *Second*, to impress with the strongest possible emphasis, that ear training, which is largely a cultivation of the musical memory, is the basis of all musical education.

"Musical Memory and its Cultivation" is divided into two parts. *Part I* contains seven chapters, as follows: General and Special Memory; Musical Memory; Visual Memory; Musical Memory in Connection with Practical Execution; Muscular Memory; Visual and Special Memory; Mental Memory. *Part II* contains six chapters as follows: Necessity for the Cultivation of Musical Memory; General Conditions Favorable to Memorizing; Suggestions for a Scheme of Memory Training; Method of Studying Pieces for Memorization; Memory Training and Examination Schemes; Memories of Musicians.

A valuable work which should be read and studied by all musicians.

Paper Binding. Price, 50 Cents.

Modern Method for the Reed Organ



Embracing the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation; also Containing Various New and Important Features, such as Registration, Stop Nomenclature, Adaptation of Piano Music, etc., etc., Not to be Found in Any Other Work of the Kind

By W. F. SUDDS.

As the title implies this method is modern, the newest ideas, and their practical application, governing its compilation. It treats all subjects in a terse and effective manner.

Among the many excellent features of the MODERN METHOD, we direct attention to the following:

It begins with Dictated Lessons.

The Rudiments are explained with remarkable clearness.

It is Carefully Graded.

It is sure to Awaken the Musical Instincts of the pupil without smothering the soul with too much drudgery.

The Fingering is the so-called Foreign, thus according with all the best class of modern musical publications for either Organ or Piano.

It contains a complete treatise on registration as applied to the modern Reed Organ, also full information and comparison in the matter of Stop Nomenclature.

It is the only work of the kind treating the subject of Adapting Piano Music to the Reed Organ.

Every variety of Touch is clearly set forth accompanied by illustrations (drawn and engraved expressly for this work), showing the movements of finger hand and arm.

The Scales are introduced in an effective manner.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a work which cannot fail to interest both the practical teacher and the earnest pupil.

MODERN METHOD is the result of many years' experience as a teacher, by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates and on the best grade of music-book paper.

Half Cloth Binding. Price, $1.00.

FIFTEEN RECREATIONS FOR ADVANCED PLAYERS

(IN THE FOURTH AND FIFTH GRADES)

No collection of similar size and price contains so many Grades IV and V pieces, and no other collection of similar character can claim the same careful preparation in revision, fingering and annotation. The selections are admirable and admirably contrasted, and the collection contains material suitable for all occasions. Want of space prevents printing of the contents, but we can run no risk in ordering as we will cheerfully refund money in case "FIFTEEN RECREATIONS" fail to prove entirely satisfactory.

Paper Binding. Price, 50 Cents.

DICTIONARY OF MUSICAL TERMS

100 Pages. By STAINER and BARRETT. 6 x 9 Ins.

Compressed from the imperial 8vo Edition, by K. M. ROSS.

We take pleasure in presenting a compressed edition of Stainer and Barrett's valuable work. Mr K. M. Ross, in his preface says: "In reducing this book from the author's larger work, we have endeavored to omit only such terms as are not in general use, but have been compelled to eliminate an amount of details, in order to keep within reasonable limits. To the general public it is hoped that this edition will be found of practical utility."

"Dictionary of Musical Terms" is a neat and attractive book. It is offered at a nominal price with the hope that it may prove of incalculable value to those in need of a handy reference book.

Paper Binding. Price, 25 Cents.

WICHTL'S YOUNG VIOLINIST

A new and magnificent edition of Wichtl's celebrated violin school, including the original 100 progressive exercises in the first position, through all intervals and keys, with a second violin part for the teacher, to which we have added "Pleyel's Celebrated Duets for Two Violins"—carefully fingered and bowed—and a splendid collection of Popular Duets for Violin and Piano. Without exception ours is the best edition of this standard work. Compare it with others.

Half Cloth Binding. Price, $1.25.

Thirty Standard and Popular Operas

ARRANGED FOR VIOLIN AND PIANO

Violin and Piano, 200 Pages. By A. S. BOWMAN. Violin, 64 Pages

In this superb collection the compiler has displayed taste of the most eclectic character, his selections comprising the various "schools" of music—French, German, Italian and English. In one compact volume, grand opera, opera *comique* and opera *bouffe* have contributed their choicest melodies. The list includes the great operatic successes of a generation ago and passes, in continuous order, to those of the present day; we have Rossini, Donizetti, Verdi, Wagner, Bizet and Mascagni, in close relation. In this arrangement that happy medium has been reached which presents just enough difficulty to interest the player without proving troublesome or overtaxing the powers of the average performer. Without exception, it is the most useful and entertaining work of its character in print.

"Thirty Standard and Popular Operas," for Violin and Piano, is a handsome volume of 200 pages, bound in half cloth. The same, for Violin, contains 64 pages and is neatly bound in paper. Both are printed from new plates, on a fine quality of music-book paper. No expense has been spared to make them perfect in every respect.

Violin and Piano, One Volume, Half Cloth Binding. Price, $1.25. Violin Alone, Paper Binding Price, 75 Cents. Both Books, if ordered at the same time, $1.50.

POPULAR SELECTIONS FOR MANDOLIN AND PIANO

By JOHN J. EBERHARDT.

Mr. Eberhardt, well known as a composer and arranger of music for the mandolin, and for mandolin clubs, is also leader of one of the most popular clubs in the United States. We have, therefore, no hesitation in recommending anything that he may offer in this particular line.

"Popular Selections" is a large book (9¼ x 12 inches) of 128 pages, printed from engraved plates, on fine quality toned music-book paper, it has an attractive cover.

Paper Binding. Price, 50 Cents. If Sent by Mail, 11 Cents Additional.

BAUMFELDER, F.

Op. 215. No. 19 Harlequin (Der Hanswurst) . 20
A very bright piece, well treated and clear in form. The little figure of sixteenth notes is sure to attract. Good study in staccato.

BEAUMONT, P.

At the Twilight Hour 30
Of quite different character. A rather broad melody calls for a singing touch. The wide accompaniment in left hand will require care. Very pretty.

Spring's Delight 30
This must refer to the pleasant May days, for it is full of cheer and sunshine. Good for teaching and parlor playing.

Twinkling Stars 30
These stars twinkle very melodiously. A graceful melody without special difficulty characterizes this composition.

BIELFELD, A.

Bygone Days. Menuet 20
The days that are passed are not remembered in sadness, for this is a cheery little dance in ¾ measure. Some good practice for left hand.

BIEHL, A.

Op. 53. No. 3. Gretchen and Her Doll (Gretchen und ihre Puppe) 20
Another bright piece, full of tune and presenting no hard spots. Considerable staccato in both hands.

Rondo Militaire 35
A martial composition that will set the feet to marching. Needs spirit in its playing.

Op. 52, No. 18. Rope Dancer at the Fair (Die Seiltänzer auf dem Jahrmarkt) 20
An excellent finger study, with chords in left hand. Short and interesting.

BOLCK, O.

Op 68, No. 5. Roguishness (Schabernack) . . 20
One would hardly look for roguishness to be expressed in the minor, but it is done—and well done—in this little piece. A nice staccato scale for left hand.

BURGMÜLLER, F.

Hunting Song (Kreutzer) 20
A good teaching piece, and pretty withal. Arrangement of a scene from the opera, "A Night in Granada."

DOLES, R.

Op. 10. Little Waltz (Une Petite Valse) . . . 20
A very excellent teaching piece. Contains opportunities for phrasing, finger and hand development, and when learned, is well worth playing.

EILENBERG, R.

Op. 46. No. 3. Come to the Dance (Komm' zum Tanz) Schottische 20
This invitation to the dance is alluring. Bright in its subjects and full of "go," it is sure to please.

ENGELMANN, H.

Op 308 No. 1. Berceuse 20
A real bit of inspiration. A beautiful theme is interwoven between the two hands. A fine study in expressive playing.

Op. 430. No. 5. Jolly Parting. Scherzo 25
These people must have parted in good humor, for the scherzo is a gem. Lightness of touch and nimbleness of finger are needed. Results will be good.

Op. 430, No. 2 Out for a Day's Sport. Rondo 25
Excellent teaching piece. Full of all that attracts the young player, and can be made the means of material advancement.

FISCHER, O.

Op. 114, No. 2. At the Shooting Match 20
Good study in dotted eighth and sixteenth rhythm. Should move firmly and with well controlled arm.

GAEL, H. van.

Op. 83. Marche Guerrière 35
Stirring march. Good wrist study. Apart from its beauty, its rhythmic character is valuable.

GÄNSCHALS, C.

Op. 29 Our Loved One (Unser Liebling) . . 30
A sentimental piece, calling for good melody playing. Very tuneful. Without octaves.

GEIBEL, A.

Good Morning Scherzo 35
Good study in rhythm and staccato. Melody work in both hands. Full of brightness.

Good Night. Berceuse 35
A good-night song, nice to play. It is simple in construction, the theme being principally in double notes, with bass of single eighths.

Pleasant Summer. Melody 35
An excellent study in melody playing. Lovely little melody with simple accompaniment.

HEINS, C.

Op. 224 Cuckoo Clock (Die Schwarzwälder Uhr) Salon Polka 30
The runs in this call of the cuckoo will be good training. Light wrist and flexible fingers are essential.

Op. 181, No. 2 Spring Wanderings 30
Good march. Excellent practice, and effective when learned.

HIRSCH, T.

Op. 44 On the Caroussel (Auf dem Carousel) 35
A cheery piece, recalling summers at the shore, with the fun at the merry-go-round. Good practice, too.

HOLST, E.

Beach Promenade. March 30
Another seashore piece. A picture of the crowds on the board walk. It is a tuneful march presenting no difficulties.

Fresh Breezes. Waltz 30
A breezy waltz, easy, but pleasing and useful. Presents a great variety of melodic themes.

Restless Waves. Tarantella 30
The restless sway of the waters is well pictured in the never-ceasing movement of this composition. Worth study.

JOHN, F.

Op. 251, No. 3. Gipsies Are Coming 20
The wierdness of the gipsy is in this. Should be played quickly and with lightness. Good practice in left hand skips.

KAISER, P.

Op. 2, No. 3. Schottische 25
Graceful dance, full of melody. Not difficult. One of a set of five easy dances entitled "The Children's Ball."

Op 2, No. 4 Waltz 25
A nice waltz containing some good practice in run playing. Another selection from the same set.

KRENTZLIN, R.

Op. 4 Army and Navy March 35
An attractive march, presenting no special difficulties. Inspiring and brilliant.

LICHNER, H.

Lords and Ladies. Minuet 30
A graceful minuet, worth playing. Stately movement can be well brought out.

MERKEL, G.

Op. 31, No. 2. Merry Huntsman (Fröhlicher Jägersmann) 20
Typical hunting song, well written and brilliant. Attractively harmonized.

MUTTER, C. F.

Jolly Guardsmen March 35
Brilliant and stirring. Excellent for thirds and octaves.

NÜRNBERG, H.

Dancing in the Meadows 20
Meadows gay with flowers and children full of joy are apparent in this lively little piece.

OESTEN, T.

Op. 202. No. 4. Doll's Dream 35
A piece of descriptive music. Contains a cradle song, the dream, and a dance.

SARTORIO, A.

Op. 229, No 9 Off to the Chase (Auf zur Jagd) 30
Another piece of musical description. A cheery 6-8 movement, and a real hunting song.

Op 229, No 10. Torch Dance (Fackeltanz) . . 30
Characteristic piece of much merit. Excellent practice in wrist touch and syncopation. Can be made very realistic.

SCHILD, T. F.

Always Gay (Immer Flott) March 30
An attractive march with no troublesome places. Brilliant and joyous composition.

SCOTT, H.

Quiet Delight (Stillvergnügt) 35
A bright melody sure to please the pupil. Sprightly movement.

STREABBOG, L.

Columbine 20
An attractive piece presenting a good study of light, yet singing staccato. Arms must be well controlled.

Harlequin 20
Useful and pleasing piece. Suggests tumbling of the clown.

TSCHAIKOWSKY, P.

Op. 39, No. 8 Waltz 20
Well worth using. It is healthy in sentiment, and thoroughly musical.

WANDELT, B.

Op. 12, No. 1. Doll's Waltz 30
Graceful and melodious. Excellent for phrasing study in simple forms.

WEISS, P.

Op. 19, No. 6. Evening Song (Abendlied) . . 20
Tender little song, calling for nice treatment. No technical difficulties.

WENZEL, H.

Bell in the Valley (Glöcklein im Thale) 30
A descriptive piece in which the chime of the bell is frequently heard. Presents no particular difficulty, beyond the light touch of the grace notes.

Brook in the Wood (Der Waldbach) 30
Brilliant tone piece in which the gurgle of the brook, as it rushes over the stones, is heard. Excellent practice.

Greeting to Appenzell (Erinnerung an Appenzell) 20
Tuneful and bright. Of no particular difficulty, and furnishes interesting practice of light chords.

WOOLER, A.

Little Cavalier. March 35
Graceful little march, without heavy chords or great stretches.

ZIESE, L.

Sweet Hope. Melody 20
Characteristic melody requiring a singing finger touch. Can be made very pleasing.

Published by HATCH MUSIC COMPANY, Philadelphia.

SIX WEEKS SUMMER SESSION

OF THE

Clavier Piano School

IN NEW YORK CITY

THE VIRGIL CLAVIER METHOD

SPECIAL TERM
FOR TEACHERS AND PLAYERS

BEGINNING

July 8th, 1901, Ending August 17th

A. K. VIRGIL

DIRECTOR

EXAMINATION AND ENROLLMENT DAYS
Friday and Saturday,
July 5th and 6th

Further particulars by addressing the

Clavier Piano School

26 West 15th Street, New York.

After May 1st, Address, 11 West 22d St., New York.

N. B.—The Clavier Piano School will be removed about May 1st to No. 11 West 22nd Street, Near Fifth Avenue, its new, greatly enlarged and improved quarters, where the Summer Session will be held. The location is central and easily accessible from all sections of the city and all railroad stations.

The American Institute of Applied Music

INCORPORATED 1900

By the Regents of the

UNIVERSITY OF THE STATE OF NEW YORK

212 West 59th St., New York City

EDGAR O. SILVER, PRESIDENT

Offers a complete musical education from Kindergarten work to the degree of Mus. Doc.

DEPARTMENTS:

The Metropolitan College of Music
The Metropolitan Conservatory of Music
The American Institute of Normal Methods
The Synthetic Piano School

THE COURSES

cover Piano-forte; Vocal Culture; Theory and Composition; Organ; Stringed Instruments; Interpretation and Orchestration; Sight Reading; History; Æsthetics; Opera Classes; Normal Instruction for Teachers; Public School Music.

FACULTY AND EXAMINERS:

Dudley Buck; William Mason; Albert Ross Parsons; Harry Rowe Shelley; Louis Schmidt; Richard Henry Warren; Paul Ambrose; William F. Sherman; Kate S. Chittenden; Lillian Littlehales, and others.

Residence Department in 58th St. Summer Classes June, July, August. 16th Year begins September 15th, 1901.

Address, KATE S. CHITTENDEN, Dean.

SPECIAL NOTICES.

MR. FRANK H. TUBBS,

VOCAL INSTRUCTION,

121 West 42d St., New York.

Mr. Tubbs' pupils study with him at his seashore home at Allenhurst, N. J., during July and August. Vocal Teachers from Schools and Colleges form the clientele at that time. Send for tuition and board rates.

NEW EDITIONS

of our descriptive and illustrated catalogs:

"New Songs,"
"New Piano Music,"
"New Choir and Choral Music."

THESE catalogs contain review notices by musicians eminent in their specialty and are helpful to teachers and choir and choral directors in selecting music.

NEW BOOKS.

Songs for Children.

"Songs of Sunshine." .75
62 songs. A good variety for all occasions.

"Songs of Nature." .60
A collection of songs for festivals, the seasons, etc.

"Mother Goose's Jubilee." $1
60 songs from the opera. The most singable, child-pleasing Mother Goose songs published.

New Piano Music.

"Easy Pieces in Easy Keys, Vol. II." .50
A collection of 40 pieces.

"On the White Keys." $1
An introduction to the piano.

"Four Little Hands." $1
58 easy duets.

"Thirty Duets Without Octaves." $1
For equal performers.

"Harmony Simplified." $1
By Francis L. York, M. A. A practical introduction to composition.

Oliver Ditson Company, Boston.
Chas. H. Ditson & Co., New York.
J. E. Ditson & Co., Philadelphia.

Without Octaves

We have recently issued under the above heading the following series of excellent piano pieces, containing octaves only in broken form if at all. They are of various grades of difficulty and are carefully revised, edited and fingered.

Foerster, A. Schumann, R. Op. 124, No. 6.	Nocturne (Go to Sleep Fairies) Cradle Song	25
Reinecke, Carl Foerster, A.	Dragonfly in the Sunshine The First Snowflakes	25
Hollaender, A.	Birds in the Woods	25
Foerster, A. Oldberg, A.	Flitting Butterflies The Garden Mole	25
Foerster, A. Gurlitt, C.	The Flower Fairies The Rabbit	25
Reinecke, C. Oldberg, A.	The Rain Fairies The Cricket	25
Karganoff, G. Op. 25, No. 5.	The Brook	40
Karganoff, G. Reinecke, C.	Nature's Dream A Dream	25
Gayrhos, E. Reinhold, H.	Spring's Awakening The Gnomes	25
Foerster, A. Foerster, A.	Under the Linden Tree Upon the Meadow	25
Gayrhos, E.	The Reapers	25
Elmenreich, A.	Spinning Song	25
Hollaender, A. Seeboeck, W.C.E.	In Dolly's Kitchen The Shepherd	25
Reinhold, H. Reinecke, C.	Boat Song Hurdy-Gurdy	25
Gurlitt, C. Op. 101, No. 2 Behr, F.	Morning Prayer Night's Song	25

We have just published for the piano

By Mrs. Regina Watson

Scherzino	50
Mazourka Etude	75
An Arabian Night	60

These have been played by Mme. Carreno on her recent tour in America.

Also by Pearle M. Ball

Minuetto from Suite, Op. 7	50
The Dance of the Dryads	40

Two pianoforte compositions of good quality and character, about 4th grade of difficulty.

All the above will be sent on approval.

DO YOU REALIZE

the helpful work we are doing in the matter of examining with great care all new musical publications from which we select only the best and most interesting and list them in *The Music Review*, giving a description of their character, grade of difficulty, etc.

The Music Review

is published monthly, excepting July and August, at a subscription price of 50c. a year.

Consider how valuable to the teacher of music such a catalogue will become as a book of reference.

Modern Foundation Studies
—in—
Piano Playing
Graded for Beginners.
By W. F. SUDDS.

The great progress made in the art of piano playing during the past few years has, to a large extent, rendered older books of instruction obsolete. All good works contain the proper material, but its arrangement, and the method of presenting it to the immature musical mind, often leaves much to be desired. Improvement of these particular features—the arrangement and method—has been the guiding thought in the preparation of "Modern Foundation Studies."

It is a work for beginners, and matters of vital importance, such as formation of the hand, methods of touch and tone-production, are treated in detail. In addition to the comprehensive treatment of these subjects and numerous musical examples, exact positions and movement of the hands in the proper performance of the various touches are profusely illustrated. This feature will be appreciated by teachers.

The work contains foundation material on which the most elaborate superstructure may be safely built. The music has been selected with great care, to clearly illustrate the point under consideration in an attractive manner, without wearying the student.

Paper Binding. Price, $1.00.

MODERN STUDIES
In Phrasing and Interpretation.
By W. F. SUDDS.

It is now very generally admitted that a separation of the mental and physical features is the best plan for imparting instruction in the study of music. Both may be studied at one time, but it is a mistake to suppose that mental training is the result of physical effort.

To insure proper performance of a composition, the mental concept must be perfect. A pianist possessed of brilliant technic, acquired only by long and faithful practice, may mar a good work because of inability to interpret the author's ideas, just as one may recite the *words* of a poem without a proper appreciation of their meaning and without a correct grouping into phrases. To thoroughly enjoy a musical work one must be able to analyze it, and "Modern Studies in Phrasing and Interpretation" presents the means of doing this in a most comprehensive and intelligent form.

Want of space prevents a detailed description, but we shall be glad to send the work subject to approval, so that any one may test our assertion that this is a thoroughly modern and practical exposition of the subject.

Paper Binding. Price, $1.00.

THIS SYSTEM IS COVERED BY COPYRIGHT.

MUSICAL KINDERGARTEN FOR THE PIANOFORTE

By FANNIE CHURCH PARSONS.

This system is most simple in outline and material.
It is most comprehensive and complete.
The materials used are, while very durable, most suggestive of the beauty of the art of music.
The lessons are equally instructive to either child or adult beginner.
The students do much real piano work, thus no intermediate course is necessary.
The stories and songs do not savor of the grotesque, but tend to refinement and culture.
The price for normal work, including materials, is within the reach of all.
The work can be taken by mail, or of a normal instructor, or of Mrs. Parsons personally.
Send for illustrated booklets.
Correspondence should be addressed to

MUSICAL KINDERGARTEN COMPANY,

CHOPIN'S MAZURKAS.

FREDERIC S. LAW.

Chopin's genius, in confining itself to the piano, was manifested in probably the narrowest sphere which any man of like gifts ever chose for musical expression. That a man who wrote practically for but one instrument, who never wrought in larger forms than the sonata and concerto, and then only sparingly, should be accounted by many as belonging to the really great in music, is in truth something of an anomaly. For, after all, from Shakespeare to Goethe, from Bach to Beethoven, versatility and productivity are the hall-marks of genius.

Chopin's contemporaries, with a few notable exceptions, failed to perceive that the new notes of individuality and nationality which he struck were more than equivalent to many repetitions of those which had already been sounded. Then, too, during his lifetime his name as a composer was more or less overshadowed by his reputation as a pianist and teacher. His music, both in form and technic, was so foreign to the prevailing style of the day, that it won popular recognition but slowly. The Chopin cult began only after his death.

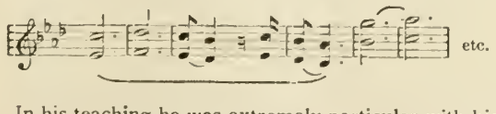
It can hardly be doubted that he was conscious of his right to stand among the great in his art, though he never exhibited this consciousness in any assertive form. Proud, reserved, a clue to his most intimate feelings is best had through his music. The mazurkas and polonaises are the most subjective of his works and the most suffused with national color. The mazurkas, in particular, are interesting as a key to the interpretation of his music in general. In this lies their value to the player and the student. They afford graphic illustration of the salient traits of Polish character and music; the persistent undertone of sorrow, in even the gayest moments; the sudden outbursts of passion so often followed by a feverish gaiety, the capricious rhythms; the inverted accents—all the peculiarities of Chopin's music are found in more comprehensible form than in his larger works. Particularly is this the case with the shorter and less involved mazurkas—those which, as Liszt says, smell least of the lamp and are the easiest to play. In the mazurkas therefore, the player will find the best preparation for the ballades, scherzos, and polonaises, all of which are more characteristic than the nocturnes and waltzes.

Chopin was the son of a French father and a Polish mother; the fire and passion of the Slav were ever struggling with the polish and refinement of the Gaul. These warring impulses can be traced like "the thin, red line" throughout all his music. Take, for example, the familiar mazurka in B flat, Op. 7, No. 1. It begins somewhat excitedly and with an upward sweep, which increases in passion until it reaches a climax in the fiery trill of the third measure; then it drops abruptly into a *piano* and *dolce* phrase full of grace and charm. The effect is that of an essentially noble nature carried by passion to the point of violence, and suddenly recoiling in obedience to the nobler and more generous instincts. Such conflicts are often suggested in Chopin's music. There is also found a Hamlet-like irresolution, as if the soul were roused by an inward sting to struggle against an impending fate, only to sink back affrighted by its weight of responsibility.

A noticeable feature in the mazurkas is the frequent accent placed on the third count of the measure. This is peculiar to the genuine Polish mazurka and indicates a sharp tap of the heel on the floor. This peculiarity was told the writer by a Polish lady in Paris, who also pointed out to him as one of its best examples the mazurka in F minor, Op. 7, No. 3. The first mazurka in F sharp minor, Op. 6, No. 1, illustrates the same inverted accent through persistent syncopation. An accent on the second count also occurs, but it is not so frequent or so characteristic. Arbitrary accents are not uncommon, *e. g.*, the first two measures of the mazurka in E minor, Op. 6, No. 3, are accented on the third count; the next two measures on every other count, introducing a duple rhythm in triple measure. All these metrical irregularities lend a charm of the unexpected to the generally uncompromising rhythmic design of a dance form and render it less conventional.

Among the harmonic peculiarities may be noticed the frequent use of the augmented second and the sharped fourth, which occur in many Polish songs. These intervals, in connection with the pentatonic scale, *i. e.*, a scale which omits the fourth and seventh, give a particularly exotic effect and suggest the music of the East. The chromatic element is strongly in evidence and pre-figures many of Wagner's most striking effects in miniature. At times Chopin even seems to be groping after a smaller interval than the half step. Take, for example, the remarkable chromatic sequence beginning eleven measures before the end of the mazurka in C sharp minor, Op. 30, No. 4, which suggests a more minute division than the ordinary chromatic scale. It recalls what Parry in his "Art of Music" calls the "howling element" in Eastern music, which is due to the octave being divided into many more tones than the twelve upon which European music is based. The Arabian scale, for instance, has twenty-two; some savage tribes of Africa have songs of small compass in which quarter-tones occur. These small intervals give an extremely gruesome and wailing effect to their music.

Other peculiarities of the mazurkas are the frequent triplets; the drone bass, which gives an air of rusticity to many of the dances, and the occasional use of the old Church modes. An apparent monotony sometimes appears in the repetition of one and the same phrase; *e. g.*, in the mazurka in B minor, Op. 30, No. 3, a two-measure phrase occurs no less than eight times in succession. In the mazurka in D major, Op. 33, No. 3, an eight-measure section is played six times in succession, and after an intermezzo in B flat major, it occurs six times as before. The practiced Chopin player avoids the monotony attendant upon such repetitions by discreet variations in power and tempo. Such variations, indeed, have to do with the innermost being of Chopin's music. He used to indicate the peculiarly fluctuating tempo which characterized his playing by the term *rubato*—literally, "robbed;" a sort of robbing Peter to pay Paul—in other words: slight accelerations and retardations which practically balance each other. In his later works he abandoned its use, saying that the sympathetic player would divine the passages where such a style was fitting, and that the unsympathetic player could never apply it appropriately. Hence the superstition that Chopin must be played out of time. This is a thoroughly mistaken idea and has led to many travesties of his compositions, *e. g.*, the follow ingdistortion of his first waltz in A flat major:



In his teaching he was extremely particular with his pupils about their keeping exact time. Only when they had thoroughly mastered measure and rhythm did he allow liberties with the tempo. Singularly enough, he was fond of teaching. In this he stands alone among composers of his rank. He shrank from playing in public; the studio was more congenial to him than the concert room. His position obliged him to appear in Paris once or twice a year, and for these appearances he prepared in a curious manner; he shut himself up for two weeks and practiced Bach—certainly the last composer whom one would think of associating with Chopin.

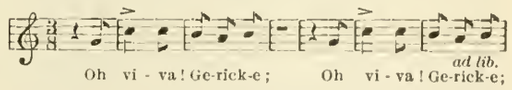
Liszt's explanation of the *rubato* is this: Look at a tree; its trunk is firmly rooted in the ground, but its branches wave in the wind and the light quivers through the leaves. That is *rubato*. Another explanation given by a pupil of Chopin is that the right hand only takes liberties with the time, the left hand acts as conductor and follows the measure strictly. The use of the term *rubato* in some of the early mazurkas shows that they were not designed for dancing, but rather to represent the ideal of the dance, and it is in such a spirit that they are to be played. The same is true of the waltzes, which call for a tempo much too rapid for actual dancing.

After all said and done, it takes a Pole to bring out all the poetry, pathos, and passion hidden in these fascinating compositions, which are too much neglected by the majority of pianists. For the most part short and unpretending, they afford no opportunity of dazzling an audience by a display of technic, so that most concert players pass them over for something more grateful to the executant. Yet, as we have tried to show, they are valuable to the student as a preliminary study to Chopin's larger works, while those who have been so fortunate as to hear them played by Paderewski or de Pachmann know what an intrinsic charm they possess—a charm all their own, and one which singles them out from all other works of their gifted composer.

BIRD SONGS.

J. P. T.

Earlier in the day the "jips" and the "wishts" and the "zhweets," in their triplet "jip jip jip," "wisht wisht wisht," "zwheet zwheet zwheet," held carnival to their heart's content. Now, in the hush of approaching vesper time, up-tuned a master voice,—the oriole in one of the stately trees in front of the house—and he sang:



over and over for a spell; then varied it a bit by depriving the word "Gericke" of its final vowel, placing the other two syllables together on the leading note and leaving them there!—with their gutteral *k* briskly clipped.

I was standing in the interior of my room when this vocal strain floated in through the open windows; so I took from the table a little pitch-pipe, when the solo had ceased, and proved its location in the key of C.

Had the mate on her nest in the woodbine of the piazza-roof been endowed with any adequate feeling of harmonic justice she would have given him a *warm* reception at their next interview.

If his hearty paean to the renowned master of the symphony series had been rounded off with a lawful cadence, he would have received full credit for the rich quality of his noble voice.

It seems sometimes to be a pet trick with the birds, in their many varied melodies, to leave the listener thus in an expectant attitude.

Nothing is so strong as gentleness, nothing so gentle as real strength.—*St. Francis de Sales.*

THE

Teachers' Forum

Conducted by N. J. COREY

This department is inaugurated for the purpose of uniting the many teachers who read THE MUSICIAN in a bond of professional brotherhood. It is to be their medium for the interchange of ideas, experiences, encouragement, discouragement and difficulties. The fullest correspondence is invited. The questions will be answered and suggestions given by the conductor and the contributions of those who wish to gain new light or to present their methods will be printed. We propose helping ever teacher who will permit us to do so; we intend to do everything possible to overcome the isolation with which you are burdened. Will you co-operate with us?

No conditions are attached; the department is open to *all* MUSICIAN subscribers. Address all communications to the Teachers' Forum, care THE MUSICIAN, Eighth and Locust Streets, Philadelphia, Pa. Do not hesitate, but be among the first to ask help, or to give some other teacher a suggestion. Let us know what you would like to have treated in its columns.—Editor of THE MUSICIAN.

"The gates of art are closed unto none; who so entereth thereat, though he seeketh perfection, yet shall he not find it."
—Ancient Egyptian Papyrus, 3580 B. C.

GODS AND THREE-LEGGED STOOLS.

"A three-legged stool, O ye fates!"—*Horace.*

"I am uncertain what decision to make in regard to my life work, my indecision seeming to be greater because of the importance of the matter to me. Many of my friends advise me to aim to become a concert pianist, flattering me into believing that I have unusual talent in this direction. But still I hesitate and am hoping that you can somewhat relieve my anxiety of mind. . . . . " B.

Once upon a time, as the fairy tales begin, a Hindoo came in possession of a choice piece of wood. He meditated long as to whether he should have it carved into an idol, or make from it a three-legged stool, of which he stood in great need. If the former it would become an object of veneration and worship, one of the gods who were held in homage by everyone; if the latter, it would fulfill a useful function and always be ready to do a gracious service, even if a more humble one. Unable to decide the matter for himself, he called in a council of learned Brahmins. After superficially talking the matter over, they decided that the piece of wood would make an admirable fire over which to cook their noonday rice, and forthwith put their decision unceremoniously into practice, much to the chagrin of the Hindoo, being at that moment more hungry than pious, or interested in the disposition of choice pieces of wood.

This not inaptly typifies the frequent and indifferent frivolity of human discernment in matters that might involve in a little mental responsibility, people who are not only more practical than ideal in their tendencies, but more selfish than even practical. The Hindoo, had he independently followed his own judgment, would have turned his choice fragment to a useful purpose that would have been of permanent value. But as it was, he only saw it devoted to a service that any ordinary piece of wood would have been equally well adapted to. Like decisions are of almost daily occurrence, especially in the field of art. Talented people are in a quandary as to whether they are fitted to fill the high role of genius and ultimately receive the homage of the world, or whether they will be more successful if they employ their artistic talents and instincts in a humbler fashion. They get but little help when they look to those whom they consider their superiors in wisdom and judgment, and more than likely will be told that they will do better to devote their energies to something useful.

But it is really a serious thing, advising young people what use to make of their talents, and experienced musicians frequently find themselves in a position wherein they are asked to play the role of the learned Brahmins. It is a serious matter, particularly because of the liability of mistake. It is so difficult to always be sure in our estimates and judgments, especially in such elusive matters as artistic endowments. Sometimes a case may seem almost hopeless, and yet the student eventually turn out to be a most useful member of the profession, and achieving a by no means inferior position in the musical world, a credit alike to himself and to the art. It is hard to tell what may not be accomplished by perseverance and intelligently directed effort. It is difficult to determine into how great a flame a small spark may be fanned, and therefore one hesitates before advising a youthful aspirant to abandon his high ambitions. The responsibilities of such decisions as the latter are not always agreeable burdens to carry, especially if the advice is not followed and the student eventually becomes an ornament to the art. There is nothing so filled with both surprises and disappointments as the careers of aspirants to artistic honors. Not only do those of apparently meagre gifts reach a high position, but, on the other hand, many who in the beginning seem to be gifted with remarkable endowments are never heard from, never seem to come to anything whatever.

Our correspondent in this difficult subject of choosing a career, seems to be in much embarrassment as to whether to try and become one of the gods or remain in the three-legged stool sphere of the art. It is well to remark here that a three-legged stool is by no means to be despised. A three-legged stool may fulfill a very useful function, more useful than that of some gods. A good stool is more entitled to respect than a bad and inefficient god. How many do we not see posing as gods who would far better have tried to fill some less conspicuous position. Possessing no conspicuous virtues of a brilliant order, they can hardly be said to be greatly superior to many who are more quietly employed. A teacher who is doing sincere and excellent work is more worthy of respect than a person who vainly tries to pose as a concert pianist without being possessed of the requisite ability.

The most difficult thing in connection with an inquiry of this sort, is the impossibility of forming an opinion of any real value, without being conversant with all the particulars, especially the all-important one of familiarity with the quality of the work already accomplished by the one making the inquiry. Written descriptions can hardly fully and accurately indicate the characteristics of incipient or latent genius. Furthermore, nothing is more fatuous than—"many of my friends advise." Friends are generally very free with their advice, and in proportion to their interest in the recipient do they wish to encourage, but in many cases this advice is apt to be of very doubtful utility. They are often totally devoid of musical education and of experience with the musical world and its difficulties and requirements. How, then, can they hazard a definite and authoritative opinion that will possess any real value? To people inexperienced in the musical world, what seems like phenomenal genius, is oftentimes nothing more than the most mediocre talent. To the close observer in musical matters, nothing is more common than the lack of discrimination. To the majority of people the musically inferior apparently seems the superior. This is unfortunate, but none the less a fact, in this country at least.

If there is a tendency among the uninformed to overestimate the amount of talent possessed by a certain individual, there is likewise among musicians an equal tendency to underrate; and this is as much caused by the disappointments in preceding estimates as by any confidence in having the ability to accurately determine. Individual talent is a very uncertain factor, especially from the fact that it is difficult to determine and accurately gauge limitations. Every teacher has doubtless had the experience of an apparently remarkably talented pupil who made rapid progress for a time, but who seemed finally to reach a point where he came to as sudden a stop as a wheel when the ratchet is let down into its cogs. Such a condition is bewildering to the disappointed teacher, the more so as the case is usually as hopeless as it is inexplicable. It can only be explained on the ground that every person is endowed with a certain amount of ability, beyond which it is impossible to progress. A few experiences of this kind have a tendency to make one more cautious in prophesying brilliant things for an apparently talented individual.

But to prophesy and cause the pupil to make the high endeavor, even though he fall far short of the goal aimed for, it is not so bad as to discourage ambitious talent by unsympathetic treatment. There is no doubt a great deal of this latter. There are many who have an intense desire to attain to higher things, and feel confident that they possess sufficient talent to encompass them, but there stands before them the barrier of poverty as an insuperable obstacle. On reaching out for a hand to help them over this wall from those in a position to easily extend it, the repulsion they oftentimes receive is discouraging and crushing to the spirit of any but the hardiest natures. Some natures are spurred on to renewed effort by an exhibition of disdain, while more sensitive ones are apt to be crushed by it. People who have reached a position of affluence where they could easily assist those less fortunately situated, hardly seem to realize how contemptible their actions sometimes appear. I remember at one time in Boston, at a meeting of a certain benevolent association, that the claims of a young woman with a remarkably beautiful voice had been earnestly pressed for the favorable consideration of the generously inclined, but some of the members suggested that such claims were too common, and that the young woman would fulfill a more useful career if she would confine her efforts to the kitchen. At this, Mrs. Livermore, of lecture platform fame, sprang to her feet and asked: "If they had a nightingale would they send it to the henhouse to lay eggs for dinner?" This is exactly what many of the cold and calculating men of the business world would do, and think a great deal more highly of the eggs they get for their dinner than of the choicest nightingale songs. The ultimate fate of appeals to the so-called wise and influential not infrequently results in a manner similar to that of the Hindoo with his precious fragment of wood. Those situated in so-considered high places do not display a discernment commensurate with their supposed wisdom, nor an inclination to give an upward lift proportionate to their influence. It is difficult to realize how much in human affairs is dependent upon influence, and how much comes to naught because of the lack of it.

Speaking in a general way, no effort in the endeavor for achievement is wasted, although to many a disappointed aspirant it does seem as if such were the case. After long years of unremitted practice, of dissipated energy, of heroic struggles, of unheard of deprivation, of futile efforts to obtain recognition among the gods, and in the end to become only a three-legged stool. It does indeed, seem discouraging, but did it ever occur to you how much better stool you will become for all this labor, how much more honorable company you will be able to sustain, how much better you will be able to do for them, how much better you will enable them to advance, how much greater a position of honor you will yourself be given, and in how infinitely greater respect you will be held? How much greater storehouse of knowledge you will have to draw upon in your work, of experience founded upon association with the best minds, of intimacy with the chief works of genius, of familiarity with the highest ideals to be constantly held before your pupils and others upon whom you may be exercising an influence? George Eliot says that it is better to have aimed high and failed in reaching the desired goal than to have never striven. It is the upward striving that develops and enlarges our own characters. The struggle does more for us than the actual attainment. There is no character builder like a living, working experience, especially when that experience has been in the way of high and earnest striving.

It is a mistake to depreciate the sphere represented by the three legged stool. A great deal of the best and most solid work is being done by such workers. They are endowed with gifts of no mean order. It requires talent in order to faithfully and successfully fulfill one's mission even in such a position. You will remember that the Hindoo's piece of wood was no ordinary one, his only question being as to whether it was fine enough to be made into a god. The nature of the individual gifts are the same in one case as the other. It is only a question of quality and degree. It is the world-ancient problem of fulfilling to the best of our abilities the work for which we are best fitted by nature. If one does his work well, he is worthy of all credit. There is no greater satisfaction than the realizing that one has tried to do the best for which he was capable.

If it is impossible to give advice that will fit an individual case in this connection, without being conversant with all the particulars, yet it is possible to say that it is best for a pupil in laying out a course of study to pursue exactly the same course as if intending to be a concert pianist. The training to become an efficient

teacher is along exactly the same lines. Even though one is unable to make a brilliant appearance in public, yet one wishes to play well and possess good, sound musicianship. The thoroughness of one's work should be none the less because the concert platform is not the ultimate aim. Do the best possible, and let the concert playing take care of itself. If there is sufficient ability to make a conspicuous success in this, it will manifest itself very distinctly as time progresses. Although it is well to have a definite aim in starting out on life's work, in fact a necessity if we are to do any really valuable work, yet it is well to look at it in such a way that the disappointment will not be too great even though the very highest be not encompassed. Remember that those who have reached the very highest at any one time can almost be counted on the fingers of the hands. At any rate let us show more respect to those who possesses gifts, even in a small way, than was shown by the Brahmin priests.

A REMINISCENCE.

Editors of THE MUSICIAN.

The June number of THE MUSICIAN contains an interesting account of the Bach Festival at Bethlehem, Pennsylvania, particularly so to me, because, having passed the formative period of my life among the Moravians, I know the sense of reality their religious fervor produces in those who participate in their special sacred festivals. I can never forget the first time I heard them celebrate Passion Week.

When the guns of Fort Sumter echoed the hostilities of the civil war, my father, a cotton planter on the Pee Dee, found himself widowed with four little girls to protect, the youngest eight years old. Up to that time we had had a governess, but the war closed that resource to him, so he looked about for a safe place of refuge for us outside of the state, thinking naturally enough that South Carolina would be the greatest sufferer by the conflict.

At the time of which I write, 1862, the little town of Salem, North Carolina, settled about a hundred years before, still preserved the customs, and rigidly adhered to the traditions of their Moravian Ancestors. Here he placed us in the well-known Female Institute, where we remained till June, '65. The nearest point of contact with the railroad was made by a stage line eighteen miles long, over which was carried mails and passengers by a lumbering, old-fashioned stage coach. Secluded from the outside world, the inhabitants, as a rule, were either unionists or neutral, many of them being native Germans. Thus, we, in the crowded Seminary did not realize the war, and only became conscious of it when an occasional mail brought news of the wounding or death of a loved one. The heart-rending cry of some poor girl that always told of the last news from home still rings in my ears.

The municipal as well as the religious activities of the town centered in the Church, with its beautiful ritual. No citizen was allowed to own a foot of ground, except by inheritance, unless he was a member of the Church. A certain proportion of all revenues was collected and expended by the Church for the benefit of the community at large.

The Church edifice was a large, unadorned, barn-like structure, containing nothing of value, except a magnificent organ. This was supplemented on occasion by an orchestra of wind and string instruments, the wind to the right and the strings to the left of the organ. The trombones figured prominently. With a choir of fifty or more robust voices, to interpret the music, the Gospel story of the Passion was told with thrilling effect, and a startling sense of reality.

During Passion Week all work practically ceased and the entire community passed about four hours a day in the Church. On the first day, when with subdued and reverent tread we entered, the usher gave us a book from which we followed the solemn story of the human sacrifice. Each event, each climax was accentuated by the music. Sometimes the organ in sobbing, pleading voice, more effective than human tones, would seem to bear the soul to the very Presence so that the congregation, with one impulse, would sink on the knee till the music trembled away into silence. The voice of the reader in solemn tones would take up the story, pausing from time to time, that the beautiful music, either of solo, recitative, choral or anthem might enforce its lessons on the worshippers.

This order of service continued from day to day till the climax was reached, on Good Friday, in the words, "It is finished." These words, pathetic, triumphant, blending with the music, became a vision so realistic that the most careless schoolgirl present left the Church utterly subdued, to spend the time till Easterday in decorating the graves of those who, sleeping in the peaceful precincts of God's acre, represent the Church triumphant. One of the most beautiful customs of the Moravians is that of including the dead in all their Church festivals, for they believe literally in "The Communion of Saints."

The Easterday, of which I write, fell early in the Spring, before the snow had entirely melted. While it was still dark, at that "darkest hour before dawn," we were wakened, bidden to dress, equipped with a piece of plank a little larger than a shingle, and marched out into the street in front of the Church. In utter silence we joined the procession of dim shapes, which proved to be the entire population of the town, headed by the trombones and drum, back of whom walked the Bishop. A few flaring torches showed us the way, and we followed up the short street which terminated in the graveyard. The giant cedars bordering the way, stood like sentinels with arm's outstretched, lest we disturb those whom they guard by night and day. Arrived at the entrance, we were quietly and in perfect order, ranged in companies about the graves of the first settlers. Placing our little squares of wood on the ground, we stood upon them with our faces to the East, and waited for the rising sun. In silent ranks we watched the clouds turn from gray to gold, and as the first beams of the rising sun shone above the horizon, the Bishop, from his place at the head of the oldest grave, recited in trumpet tones, "I am the Resurrection and the life, whosoever believeth in me, tho' he were dead, yet shall he live." Scarcely had the words died on the lips than the trombones burst into a German Choral, which all joined in singing. After a short service, the crowd dispersed to visit the graves of ancestors and loved ones.

Under the spreading branches of the grand old cedars lay the newly-made grave of my fourteen year old sister, while away out in the melting snows of the early Easter morning, my three brothers were encamped in the battlefields of Virginia.

From the many scenes which come back to me from the long ago, none stand out with such distinctness as those conjured by your description of the Bach Festival.

Yours sincerely,

MONTGOMERY, ALA. JOSEPHINE CARTER.

A FUGUE.

Beneath her fingers ripples melody
As from a rivulet fantastic bright
That meets anon its river: on the fly
Shouting to swell the mighty ocean's cry.

Buffalo, N. Y. —*Philip Becker Goetz.*

THE IDEAL IN TEACHING MUSIC.

W. F. WERHEIM.

"Never lose sight of the ideal in your instruction," is a thought that I would have inscribed over the piano of every studio, for the danger of drifting away from the idealism in music is great. In this, our materialistic era, the tendency among artists to put the phrase, "What is there in it," sternly in practice, is growing with rapidity; teachers in many communities are being infested by this plague, which saps the conscience and the true conception of an artist's vocation. That such unartistic proclivities cannot remain long unpunished is selfevident, and should induce every honest teacher to set his influence against the encroachment, so dangerous to all concerned.

Many teachers fail, as it would seem, to realize that they have a sacred duty imposed upon them, when parents entrust the pupils, especially the young, to their care for musical instruction and education. Especially the young, we say. It does not seem worth their while to persevere in holding out to the young musician, that it is the highest point of perfection that he is now setting out to reach. How many teachers, especially of young pupils, deem it worth while to study the individuality of their pupil and bring their method in conformity to the material with which they are working? They forget, that when the foundation is wrong the entire building will sooner or later topple over and not stand before the eyes of the people as a monument of beautiful architecture, an honor to the architect and the builder, but as a ruin, a memento of the inability or carelessness of the architect and builder.

Teachers cannot too often be reminded of the fact that it is the young plant that is carefully watched over by the wise gardener. And it is the young pupil who should receive the fullest benefit of the teachers own thorough, well balanced and scientific training. Froebel, the "Kindergarten-Vater," says: "The most important age for education is the earliest, because the manner of progress and the end are determined by the beginning." This would imply that even the very young pupil in music must receive the true conception of music, its aim and its worth, in short, the idealism of music. The true teacher, imbued with consciousness of his high calling, will not fail to instill artistic conceptions into the mind and heart of his pupils; he will make this his aim. Such a teacher is the ideal teacher, the model teacher. To be sure, in this day of dollars and cents, it is not an easy task to be inspired by lofty, but true ideals, and instil them into the mind of the pupils; to bring them to an understanding that music is something more than the mechanical playing of piano keys, or singing of "Those Goo-Goo Eyes."

But the persevering teacher will, nevertheless, overcome all these obstacles of our materialistic age, and succeed, if the soil is receptive and fertile, in planting the embryos of the ideal in music in his pupil, convincing even the beginners in this art, that the successful student of music is he who has set his aim beyond the ability to play the popular, vulgar ditties of the day.

The artist is made by holding ideals before him. Although not every pupil, even under the tutorship of the most exacting and thorough model teacher, will become an artist, yet almost every pupil can be made to realize: That music is an art, and, if possible, he is to reach the ideal, the soul power of music.

Should there, however, be some pupils who seemingly have not the staying qualities to reach this point, or the understanding of the true aim of music and of every careful and conscientious musician, if this receptive power is lacking in the pupil, then it is the duty of the teacher, for the sake of the art of music and the future existence of true artists, to advise such pupils to devote their time and money to some other vocation or pastime. Teachers should not allow the pecuniary aspect to deaden their conscience in this matter. There is an overabundance, as the German says, of "Klavierklopfen," too much of the xylophonic piano music. Why still fill the ranks of these abominable virtuosi, who find neither soul nor ideals in music!

Liszt's words, when he says: "To comprehend art not as a convenient means for egotistical advantages and unfruitful celebrity, but as a sympathetic power; to educate one's own life to that lofty dignity which floats before talent as an ideal; to kindle and nourish in the minds of men that enthusiasm for the beautiful which is nearly allied to good—*that is the task which the artist has set before him*"—should be weighed and weighed again by every teacher of music, and then become the normative principle in all of their instructions.

SILHOUETTES.

In 1723 Bach was appointed the director of the music at St. Thomas's School Leipzig, in place of Kuhnan, who had just died. The pay he received was about thirteen pounds per year, besides about two pounds for wood and candles and a small fee, on the occasions of weddings, funerals and the like. On this very modest sum he supported a large family. He was not only a great artist but a great man, and he was esteemed wherever he went for his benevolence, open heartedness, as well as for his modest and unassuming manner. Notwithstanding his many amiable qualities, Bach had a hot and hasty temper, and this sometimes resulted in very ludicrous scenes. There is a story told of an organist, who was playing at one of the four churches in Leipzig which Bach was obliged to look after; this organist was considered quite talented; but at one of the rehearsals he struck a wrong chord, which so exasperated the old man, that he tore off his wig, and threw it at the unfortunate organist's head, thundering out, "You ought to have been a cobbler instead of an organist."

To comprehend what life means in the way of truth and power, one must act as well as think and feel. For action itself is a process of revelation, and the sincerity and power with which a man puts forth that which is disclosed to him determine the scope of the disclosure of truth which he receives. To comprehend all that life involves of experience or offers of power one must give full play to all the force that is in him. It is significant that the men of creative genius are, as a rule, men of the greatest productive power.

Expert Opinions

Anent "A Critique and Some Comments Thereon."

To Live Requires Means.

In the April MUSICIAN was printed an article by T. L. Rickaby opening a symposium on the average concert criticism. This was followed, in May, June and July by excellent articles. Two excellent articles are contributed to this discussion this month.

To the May number Mr. Rickaby, who seems especially able to launch interesting discussions, contributed an article on "Business or Profession, Which?" This subject receives attention under the caption of "To Live Requires Means." These articles will be followed by others. We will be pleased to hear from our readers generally.—Editor of THE MUSICIAN.

THE TRIPLE ASPECT OF MUSIC.

Dear Mr. Manchester—Since you do me the honor to ask my views upon the ideas contained in the newspaper clipping which you submit, and since the subject is a vital one, I take great pleasure in expressing my opinions, so far as the space at my disposal will allow. The heading which I have placed here is a reference to a rather geometric way of stating my views, which I shall, for the sake of clearness adopt. Let me begin, then, by saying, that all the confusion of criticism and contrariety of judgment which we find constantly agitating the musical atmosphere, and which is re-echoed in the thundering phillipic submitted to me for animadversion, arises, I think, from a constant and most irritating confounding of music's various functions. For the sake of clearness and definite outline of thought, I have decided to compare music to a triangle. Let me say that it has three sides, or aspects. First, it is an amusement; second, it is an education; third, it is an exaltation. Now I wish to say positively and fearlessly that music, in my opinion, is legitimately to be used as an amusement, as a recreation, a diversion. You say, "Why, that is giving up the field of battle before a gun has been fired, before one saber-stroke has rung." Not in the least.

When your good friend, the uneducated editor, complains that the violinist should not have given a Hungarian fantasie, but should have played the Virginia Reel, or Moneymusk, he was more than half right. Right! How, why and when? I am no friend of that musical snobbery which is afraid to say a thing is good music till the name of the author is known, and till it is quite certain that such composer has been crowned in Berlin or Paris or Vienna. As for opinions, I am afraid of nothing; if a thing seems to me good, and I can say why I think so, I am not concerned a doit whether the name of the man who made it be Johannes Brahms, Johannes Bach, or Johannes Smithiensis. And I will go just one step further and say that not one of our greatest men has failed to be dull at times, and to have written tiresome things which could not win a word of approval if played anonymously for the first time.

The same is true of the greatest poets and novelists. Did not Horace say that at times even Homer nods, and as for Dickens, the incomparable Dickens, how many weltering floods of verbiage he lets loose from the sluice-gates, at times, and how he drops into a vicious habit of self-repetition. There are thousands of noble and moving poems in English and in all other languages which were composed by persons who wrote nothing else, or comparatively little else. Then we will say that music, like poetry, like literary prose, is good or bad according to what it is, and not in the least because so and so wrote it. Indeed, it is the music which makes the fame of the man, not the man who makes the fame of the music. Under this head of popular music, I will say that I find many of the things thus classified to be excellent in their way, and though the way is sometimes not much to my individual liking, that does not dull the edge of my perception that they are worth while. Hence, the immemorial popular tune is good. Moneymusk, the Virginia Reel? and why not, pray? Such things are the volkslieder which we rave over in a pallid ecstasy, if they are sung in German or Norse or Russian, by æsthetically gowned ladies, in exclusive drawing-rooms from cream-tinted programs of rough wrinkled paper with decorated borders. As for the rag-time negro tune, it merits all the reprehension which it is now beginning to receive, but that is chiefly on account of the nauseous and silly words to which these unhappy tunes have been linked in morganatic marriages. Some of these tunes are excellent. The "Georgia Camp Meeting," is an admirably characteristic tune, and "Whistling Rufus" is still better. As for "Telegraph my Baby," it is a good picture of a not very admirable type of masculine character, and "My Lady Loo" has really a touch of sweetness in it. "My Girl's a High-born Lady," has a fine swing, and so has the "Hot Time in the Old Town." "He certainly was good to me," despite its rather low associations, is a strongly characterized tune, and some of the above-mentioned would do to make Scherzos and Andantes out of al la Dvorak quite as well as the negroid themes which he has employed in his celebrated quartet, quintet and symphony. Of these tunes let me say that to use the symbolic language of flower imagery, "Whistling Rufus" is a sunflower tune. The "Georgia Camp Meeting" is the peony. The "Hot Time" is the dandelion, and do not forget, please, that Lowell wrote a fine poem to the dandelion, and much of our objection to it arises from its prodigality of bloom and irrepressible germinating propensities. Lowell also honors the peony with a superb line, "With its coarse constancy of hoyden blush!" and the sunflower was spoken of by Oscar Wilde as possessing "gaudy leonine beauty."

The public taste and talk, especially the talk of the American people, is a wonder truly. One year we hear rag-time, rag-time, rag-time, rag-time, till one hates the very word, and abominates the sound of the restless familiar rhythm, with its grotesque jerk of the head, and haughty wink of the lecherous eye, then there comes a change, and the very debauchees who have been glutting, gorging, smearing, daubing themselves with the pseudo-African blackberry jam of the over-sugared tunes and alleged poems, put on a solemn face and deplore the vulgarity, depravity, weakness and maudlinness of the public. You see they have been overcome with that ignoble malady to which the Germans give the graphic name "Katzenjammer," and their moral mood is the nursling of the good mama Headache.

A good comic song such as the "Fine Auld Irish Gintleman," and the best of the topical songs of the minstrels, and the choicer rag-time songs, are a good thing just as the comic sketches on the theatrical boards, and the funny scenes in Dickens and Kipling, and the half comic, half pathetic verses of James Whitcomb Riley are good things, not to mention the admirable disguised philosophisings of the incomparable Mark Twain. But these things should not be our only food, and they should only be heard at the right places. Just fancy the farce of "Cox and Box" being substituted for the usual service on Sunday evening, instead of the popular song-service. There is a use to which these things may be legitimately put, but it certainly goes without saying, that these little bits of character sketching and musical fooleries should not occupy much time, or a prominent place.

Now in the second place, to imitate the old-time preacher, music is to be used very often, not as an amusement or relaxation, not to dance by, or to march by, or to work by, which Count Tolstoy thinks its only legitimate use, but as a developer of the mind. Here we find a varied region, and there is a wide range of soil and climate in this province. One might divide up this side of the triangle into a dozen or more sub-divisions and all would be legitimate. Here is the proper domain of the concert. Now the concert may range from such high and glorious festival performances as those of the renowned May festivals of Cincinnati and the similar occasions in the eastern cities, down then to the ballad concert, and at times may be quite light and diversified, even for a time amusing, without derogating the dignity of art. The Festival performance proper should be ruled out of the catagory of the concert, for it comes in the third higher region of the solemn service.

Now as to the make-up of a concert, there is an art, and the first thing to do when selecting a series of pieces to be given during a single sitting of a miscellaneous audience, is to determine upon a principle of construction. In this deep, comprehensive, far-seeing of the inner relations of things the Germans are our teachers. The first thing which a German thinks of is the law of the structure, and so he does not make the fatuous blunder of finding fault with the nightingale for not having a protecting carapice, like the tortoise, or the lobster, nor does he blame the tortoise and the lobster because they have not a singing voice. Neither when it has been settled that a voice is the thing under discussion does he complain that the frog ought to study with Prof. Honey throat in order to approximate to the nightingale in his mode of tone-production. No, no, let us have no nonsense, in musical criticism, the nightingale for the moonlight tree, the frog for the marsh, the lobster for the sea bottom. Each thing in its place is best.

When the editor complains that the musically illiterate who had paid their money should have their tastes consulted in the choice of the pieces to be performed, he is right, and an artist may, without derogation of his rank, go a little in this way, though to be sure, a good deal depends upon the auspices under which the concert is given. Thus, if a body of intellectual and studious ladies are giving a concert, there certainly should be a higher tone of selection than if it is merely a melange, or hotch-potch for the purpose of some catch-penny charity, or for an evening's relaxation. Suppose the orchestra which is engaged to discourse sweet sounds during dinner hours at a fashionable hotel should feel in duty bound to play the Funeral March from the Eroica Symphony of Beethoven, or the orchestration of the Bach G minor Fugue, by Abert, or the Love-death of Isolde, how long would they hold their engagements do you think?

Whether a lighter bit of music would or would not have been in place on the occasion of the concert in question in the Sunny South-land or not, I am not able to decide from the meager data, but let me attempt a rude scale of graduated values. First rung of the ladder, a good, clean, witty, and at times sentimental minstrel show. This is all right in its place, though it should not take either too much time or money. Second, a concert of songs and ballads. Here there may be a wide variety, and love, war, death, the incidents of common life, the tenderness of the mother, the ardor of the lover, the gaiety of arch coquetry, the furies of war, and the shivering sublime heights of heroic patriotism may be drawn upon. This is a form of concert which will interest the most learned musician and the commonality in equal degree. Third, a showy miscellaneous concert, where the fantasie upon violin or piano, the operatic cavatina, the ballad, the concerted song, and indeed everything except the intricate sonata or fugue may be legitimately admitted. Fourth, the recital, of piano, violin or organ. Here the music must needs be more serious and intricate, sinking deeper into the mind and soul, and he who complains that such an entertainment does not set his feet to patting, and does not hold his head from nodding, is simply in the wrong. Fifth, the symphony concert. Here dignity is a *sine qua non*. The very phrase symphony concert is a guarantee of the nobility, gravity, beauty, power and glory of the concert. Sixth, the chamber concert. This is practically the same thing as a recital, but makes vastly greater demands upon the minds of the listeners. There is nothing higher in our world than a great string quartet greatly performed.

Now, coming round to the third side of my symbolic triangle, I must say that my metaphor breaks down a little, for this third use of music is not to be distinguished by the kind of music given from the rather vague and variable region of the general concert, and the difference is rather in the mental attitude of the recipients. Here there should be a solemn hush of effort in the listening. There must be serious preliminary preparation for receiving the music, just such as certain religious bodies enjoin upon their members as a preparation for the reception of the Eucharist.

Music is to the real musician (and I speak it in no

spirit of levity or irreverence), a religion, and the great hours of listening are like religious retreats or sacramental occasions.

That man who finds fault with the Matthew Passion of Bach, or the Solemn Mass of Beethoven, or the Parsifal of Wagner, or the German Requiem of Brahms because they are hard to follow and understand, and who considers it a misdemeanor and pedantic parade on the part of the composer, that the music can not be understood as easily as a comic opera, or a Strauss waltz, is simply an impudent shallow-pated fellow, whom the genuine musician may, and should, treat with silent contempt. Such a man may be a lawyer of eminence, even a judge, but in music he is a baby, whose outcries should be sharply reprimanded. But as for the enjoyment of music, where does the opera come in? I answer, the opera comes in all along. The opera is not quite germane to the topic in hand, which is the duty of the hired music performer to those who hire him by buying a ticket to his concert. The opera makes its appeal to many faculties, and has a range as wide as all possible kinds of concerts. Just consider the gap expressed by Robin Hood and Parsifal.

But how shall one get into the higher relation toward music? My answer is short and simple. By reverencing it and studying it a whole lifetime. Of course, great music bores the beginner. The only cure for this boredom is to cease to be a beginner by continuing to study. I well remember a glaring instance of this experience which came into my own musical life some years ago. A certain young man stood to me somewhat in the relation that Wagner, not Richard certainly! but just plain Wagner, did to Faust in Goethe's drama. He was my "famulus," as the Germans call a particular kind of half secretary, half pet-pupil, such as every scholar has about him for mutual advantage. This young man intended to take music as a profession, and he worked indefatigably, and Beethoven, Chopin, Schumann went down his throat in large bites. I took him one day to hear a rehearsal of one of the last quartets of Beethoven, where the long movement in "Modo Lydico," the hymn of gratitude for restored health, is found. This work is, no doubt, intricate and long, but what of that, was not the lofty mood of the composer, and the experience which led to it both intricate and long? I sat there rapt, absorbed, touched to my innermost. But alas for my poor famulus Afterwards he acknowledged frankly that he had never in his life been so bored. Soon after he abandoned music and all ambition to scale its altitudes. I think, however, that woman, lovely woman, the marplot of all the ages, had something to do with this dear young man's detection. Soon afterward he married, for he realized that it would be years before he could hope to marry if he climbed Parnassus first. Thereby the mercantile interests of Cincinnati gained a worthy worker, the Church a solid exemplary member, so far as I know, and to the best of my knowledge and belief, a good woman, a staff and helper well worth while. Music lost a feeble devotee. Has she wept? I know not, but I trow not. However, brethren of the inner shrine, there are blisses mystical, transcendental, incommunicable, unimaginable on the mountain tops of the Muses where stand the noblest shrines, are there not?

We know something of this immortal happiness now, and we confidently look forward to more. We need not fret at those who can not climb the steep crags, but we shall help all who wish to, shall we not?

J. S. Van Cleve.

TO LIVE REQUIRES MEANS.

HARVEY WICKHAM.

The question is sometimes asked, "How can the conflicting natures of art and business be harmonized? To live requires means. Does not the common saying, 'Practice art for art's sake,' require some modification before it appeals to common sense?" In order to answer these questions intelligently, it is necessary to define clearly what one conceives to be the difference between the nature of business and art. It will be found no easy task, and perhaps in the end their antagonism will appear less real than fancied.

Business has been defined as the art of making money. It is, of course, improper to use the word to be defined in the definition of it, but I find it hard to describe the nature of business without using the word art, and I would be equally at a loss to give much advice to the young artist without using the word business. Many seem to think that the distinction between these two things is this: One is a pursuit followed as a means to an end, the other is an end in itself. But this is the distinction between work and play, not between business and art. The man of affairs is prone to regard the man of art as a player, it is true, using the word in its literal sense; but it is a misnomer and many are the evils which result from it. Only today a lawyer told me that he thought that there should be band concerts every week during the coming Summer season in a certain park in the city from which I write. I reminded him that the city fathers had neglected to provide funds for the concerts in question. "Never mind," said he, "the boys ought to be public-spirited enough to play for nothing." It is difficult to get a certain type of men to regard brains as a commodity. It is equally difficult to convince professionals that it requires brains to handle commodities.

The gulf is not between business and art, but between ignorance and knowledge. It is easy enough to discover faults in the average merchant. He is apt to be poorly educated. The average musician is as apt to be poorly educated too. If he were not, he would not be average All average men are poorly educated. The business man knows little and cares less about *belles lettrés*, or pictures, or poems or sonatas. He is concerned with the price of wheat, Manhattan or Leather Common. Things which are Greek, perhaps, to the musician. But I am speaking only of the average merchant. Remember that our best, or one of our best American critics, a famous poet and a thorough man of letters, Edmund Clarence Steadman, is a well known figure in Wall Street. "The merchant prince," according to Browning, is not a narrow man. "I want to know a butcher paints, a baker rhymes for his pursuit, the candle-stick maker much acquaints his soul with rhyme, or haply mute, blows out his brains upon the flute." I quote the whimsical lines in prose form to save room, but who can not see from them that the resemblances between different classes of men diminish as we ascend the scale of excellence? Does it not teach us to mix art with our business and business with our art? I am not so much of the opinion that the grocer need necessarily play the piano, as that he should learn that "the object of work is life; not that the object of life is work."

Some have thought that a business man is one who works for pay, the professional man one who labors, *con amore*. But it did not need a Ruskin to demonstrate that the "fee-first men" were of no account, either in business or art. It is true, however, that the "fee-first" principle works better in business than elsewhere, so I may as well stick to my original definition of business as the art of making money, conscious that I am doing the better class of financiers gross injustice. Let us class as business all that is utilitarian, all that makes life possible; and as art all that is altruistic, all that makes life profitable, desirable and beautiful. This is giving ourselves vastly more than we deserve; but let us proceed to the next point.

What can the business man learn from the artist?

First, that the world is ruled by its emotions. Even the prices of corn and cotton are influenced by the "bearish" or "bullish" sentiment which prevails. Some wit of a past generation, whose name escapes me, laughingly declared that the Liberal party in England would live and die in the belief that the country was ruled by pamphlets and statistics. All great inventions and reforms are born first in the brain of some man of fancy, not in the brain of a man of fact. Buying and selling have a narrowing influence on the mind. The merchant should be reminded in the words of the great art critic, "The seed exists for the flower, not the flower for the seed."

Second, the business man can learn, by the aid of art, to correct his too often gross materialism. It is in the beginning of study, as Bacon has truly said, that the world of sense seems the all in all. The profound scientist, though he claim that all is matter, understands by the word "matter," something so transcendental, wonderful and beautiful that his language deceives the layman. Hear a mystic attempt to describe "spirit," and you hear the same words as those with which the scientist sought to describe "matter." Evidently their quarrel, like most quarrels, is a matter of nomenclature, of words not things, of names not ideas. But the common denizen of the counting-house is a very different sort of materialist from Hæckel, for instance. He misses the controlling spiritual forces in a too close attention to their petty manifestations. He becomes, therefore, a poor prognosticator of events a poor politician and cannot even rise to a great elevation in his own calling. The *great* merchant must have imagination and initiative.

But what can the artist, and more particularly the musician, learn from the business man? He can learn to make money, for one thing, and for most of us it is a very necessary accomplishment. "How very full of worm-wood 'tis, that just at altar service, when all is at the best, the rapt hymn rising with the rolling smoke; the sacred fire may flicker and grow faint and die—for want of a wood-piler's help." But full of worm-wood or not, true it is. He who would write symphonies must have bread to eat and coal to burn while he is at work, and not everybody meets with accomodating legacies at critical times, as a friend of mine once did. Don't ask for his name; it hasn't been much heard of since! Money-making is a matter of details. I received only yesterday a note from a teacher of music which preaches a little sermon on this text. It was written on linen paper with a neat, business-like letter-head. If more musician's had letter-heads, and fewer of us swelled heads, there would be more bank accounts to the credit of the profession. There was nothing peculiar about the letter or the letter-head. The latter gave the address of the writer's studio and the branches taught. Just what you would expect from a commercial house; but unfortunately not just what you would expect from a teacher of singing or piano playing. I need hardly add that the note was well written, clear, brief and to the point, or that the writer is notoriously prosperous. Need I state that his studio is neat, clean, attractive? Need I mention that he is prompt and accurate in the matter of accounts? The successful man does things which the unsuccessful thinks beneath his notice. He takes pains to remember names and faces, he is an observer of human character, he realizes that "success is a social matter" as well as the result of desert. Can we not learn from the business man to be honest in small things, to give pupils the time they pay for and make them pay for the time they engage? Is it business-like to leave the selection of teaching pieces till the last moment, and then be at our wit's end to know what to give?

Lastly, the artist can learn from the business man to despise the visionary. What, someone exclaims, despise the seer, the prophet, the man of genius who sees visions and dreams dreams? It is not that kind of visionary that I have in mind, though the literal signification of the word implies such synonyms as above. I have in mind the impractical man. From the true man of ideas he is very remote. The homage of the world is due to him who can conceive of vast enterprises, and has yet the wit to carry them out. To hit upon a pretty theme is little; to develop it into a masterpiece proclaims the great musician. I may guess that Lower California would blossom like the rose if it had the one thing lacking, water. But the one who will deserve credit is the man who will institute a system of irrigatian on the peninsula. Men wisely distrust all that has not *proved* itself to be good. In theory so many things work well which fail in practice. You remember the engine which charmed mechanics by its simplicity in design, but which proved worthless in action on account of its lack of balance—a thing no one had thought of. Bacon, who was of a poetical as well as of a philosophical and scientific disposition, nevertheless, declared that dreams were flimsy flamsy things, unless one had the power to act them. To be a Napoleon it is not enough to plan great campaigns. One must count the soldiers in every battallion and see that the horse-feed is of good quality and abundant. The ability to master the practical details of an undertaking, while at the same time preserving a broad, bird's-eye view of the whole, is what distinguishes the man of affairs from the mere man of action on the one hand, and for the man of fancy on the other. Cecil Rhodes believes that ambitions amount to very little without the cash to carry them out. An ordinary man might have dreamed of an English empire in Africa. It took a very extraordinary man to make it a fact, to actually earn the cash.

Do not gamble with fortune by pinning your faith to vast schemes which have uot been reduced to careful calculations at least. Neither bury yourself in a narrow routine.

If you wish success in life make perseverance your bosom friend; experience your wise counsellor; caution your elder brother; hope your guardian angel.

Angel of Music! when our finer speech
Is all too coarse to give the heart relief,
The inmost fountains lie within thy reach,
Soother of every joy and every grief.

—*W. Allingham.*

Young Composer's Column.

RULES

1. MSS. marked "Young Composer's Column" must reach us by the 10th of the month to ensure notice in next issue.
2. Each MS. must bear the full name and address of the writer; the initials will be used unless a *nom de plume* is added.
3. Stamps must be enclosed if MS. is to be returned, but it is to be distinctly understood that the Publishers assume no responsibility for any MS.
4. No charge is made for the examination of any MS., and compositions of any nature may be submitted. The criticisms will be general and of such a nature as will be helpful to those honestly desiring frank and unbiased criticism.
5. No criticisms will be sent through the mail.

S. N. C.—(425-426). There is no doubt about your talent. The Song and Scherzo are both well invented, clear in style, pure in melody and harmony, with good rhythm and above all, musical. You do not write like an inexperienced person, nor are your technical powers those of a well-schooled practical musician, so that we are a little in doubt as to what to say to you. If you have already had a good master in theory, go back to him and study earnestly to get further mastery; if you have not studied very much you ought to begin at once. Let us point out a few things in the song. On p. 2, 1st and 2d meas., we think A♮ should be B♭♭; p. 2, 5th meas., we think you should stick to D♭ for your first bass note—you have D♭ in meas. 4 and having once taken a tonic six-four chord for the cadence you should keep it. The consecutive 8ves. in meas. 6, p. 2 from C♭ to D♭ (r. and l. h.), are objectionable. On p. 2, meas. 10, we think you should have kept B♭ in the bass instead of changing to C♮; the sequence p. 3, meas. 10, 11, 12 is good, but we decidedly object to the chord of A in its root position being immediately followed by the chord of A♭ in its root position (p. 3, meas 12, and p. 4, meas. 1) You have a most charming figure in your accompaniment (p. 4, meas. 6, et seq) and the ending (p 6) is effective. The Scherzo is stoutly constructed, in fact nothing can be urged against its form; the Meno Mosso is melodious and rich in harmony; here you have shown (p. 7, meas. 16 for instance), a good grasp of a tonic pedal, the very point in which you failed in your song. The consecutive 8ves. (p 11, meas. 2 to 3), are objectionable; and instead of two dotted half-note chords (p. 11, meas. 1, 2) with a *fermata* over each, make each chord into two measures keeping up the motion. We think that the modulation back to the first theme (p. 12, 13) is so long as to be out of proportion; the Coda (p. 15, 16) is excellent. We think that the 'Cello (p. 6) should have entered on a point of imitation, or else its entrance theme should have been heard afterward; as it stands, the 'Cello enters the piece not like a member of the family, but like a servant. On p. 7, meas. 2, 3, you make a very bad effect by violating the rule that the resolution of a suspension must not appear at the same time with the suspension. The neapolitan sixth chord (p. 7, meas. 6) seems to us to sound cheap; between meas. 18, p. 6, and meas. 6, p. 7, there is one measure too many. We are much interested in your work and predict for you, if you are industrious and studious, a future.

H. W.—(427). The Prelude is the best thing except the Mazurka we have seen; it is a little vague in form; we find ourselves at the cadence sooner than we expected, or else we are annoyed at finding it delayed. Do not understand us as fighting for the four bar rhythm continually; but we do think that a young composer should base his technique on that and depart from orthodox rhythms only as he has *reason* for so doing. We are pleased to see your progress; your Prelude reminds us of the Chopin Prelude in G major.

M. A. S.—(428-431). The "Lullaby" has a very pretty melody and shows good invention; the harmony is poor, that is, the harmonies you employ are not chosen wisely; in this respect, however, you do better than formerly. "Her Portrait," is a pale and unsuccessful imitation of the "Lullaby." "My Little Lost Darling" is better in melody and harmony. "L'Envoi" is the best of the lot. You have a facility of melodic invitation of an order somewhat better than the popular-song-of-the-day type; you should study harmony; within 50 or 60 miles from you are two great cities and in those cities are some good musicians.

L. R.—(432). "First Mazurka" has very little merit; it is incorrect in all respects.

"A Printer."—(434). Our impressions of the Minuet are favorable; your harmonies are in the main correct, your melodies are good and you get a good "swing." In the Coda meas. 5 and 6, are a misfit (a bad one, too), and your rhythm is very lame from 7th to 12th meas. From "Presto," it is all right. To us the transition from F major to G♯ minor and B minor at the end of the first strain, seems very forced; you have a good deal of "stuff" in you and ought to study earnestly. We wish we could hear from you again.

L. S. B.—(433). The melody of your class hymn is ordinary and its harmonization is about as bad as can be; if we should write, "Us don't can done nothing," it would not be more illiterate than your use of chords.

F. E. C.—(435-436). We have no reason to doubt your word, but it seems almost impossible that any anyone should have got as good a grasp on harmony as you have and yet have picked it up without a teacher. You want an honest opinion and we have much pleasure in saying that your songs give every evidence of unsual talent, and when we say that we do not mean technical talent, though even on that side your work promises much; what encourages us particularly is the true musical fervor and enthusiasm you have. Your melodies are graceful, original and expressive and your harmonies rich and picturesque. Of course there are many errors as regards the incidentals of notation and the setting of the words; on the whole, however, there is nothing to discourage you. Lest we seem too enthusiastic in our criticism, let us point out a few things to be remedied. In "Love's Reward," from meas. 1 to 2, you have a bad case of consec. octaves; this progression is repeated several times and must be eliminated if the song is to go. Meas. 10 to 11 (B♭ to A) you make the melody and bass move together; is that not illogical? Page 2, meas. 1 we think the consec. 5ths, by contrary motion between bass and melody are a distinct weakness. In the 8th meas. you end with a second inversion! On p. 3, meas. 7 to 8, the octaves between bass and melody are too palpable, and those between the same parts at the end of meas 8 are extremely ugly. The stems of notes that are sung to different words or different syllables should not be joined. You offend in this way constantly. You ought to pay more attention to the rhetorical effect, too. Take the first line of "An Evening Love Song;" the word "dearest" is well declaimed, but "evening" is drawled out. If your melody had not been good the effect of the hanging back of the words would be bad; you must not expect to sin in this way all the time, however, and let your melody make up for all. Study Arthur Foote's songs or those by Margaret Ruthven Lang and see how near their melodies approach speaking. You do it yourself on the words, "And when the night dew upon the rose appears." Let us hear again from you and do not neglect your talent. Talent, genius, wealth, beauty—all these are trusts from God.

Lilla B.—We are very sorry, but to correct your march so far as you have it written, or to help you complete it, is outside our province. Finish it to the best of your ability and we will then advise you. We thank you very much for your appreciative letter.

REVIEWS.

HIGHWAYS AND BYWAYS OF MUSIC. By Hugh A. Clarke, Mus. Doc., University of Pennsylvania. pp. 152. Cloth, uncut edges and gilt top. 75 cents.

This book, a companion volume to "Music, and the Comrade Arts," is a series of six essays on the history of Music as an Art, with its development along that line from the days of myths down to the present composers. In no sense is the book biographical, but it deals with the trend, the *motif* of the Musical Art.

In the essay on "Myths," the universality of certain striking coincidences is pointed out, and argues for the great antiquity of the art. "Literary Men and Music" is a plea for the fuller recognition on the part of literary men of music as a "great art." Professor Clarke sets forth the theory that the "Folk Song" is simply an indication of racial temperament, out of which "art music" may grow, and that the German branch alone of the Teutonic family was possessed of the requisite temperamental conditions for this growth. In "Modern Tendencies," the author has attempted to strike a balance between the losses and gains of the art since the first quarter of the century just ended.

TEN SINGING LESSONS. By Mathilde Marchesi, Author of "Marchesi and Music." Preface by Madame Melba. Introduction by W. J. Henderson. pp. 198 Cloth, gilt top, $1.50.

Melba, Gerster and Nordica were among the pupils of Madame Marchesi, who is undoubtedly the world's most famous teacher of singing. These ten lessons tell much about the method which has made her name celebrated, and they cannot fail to prove of great aid to any singer, both in perfecting her art and in the preservation of the voice.

In his introduction, Mr. Henderson says: "What she has to say of singing should have uncommon value, even though it may take only the form of a few hints such as can be put in a book on the Divine Art." . . . "Mme. Marchesi has been especially successful with exponents of the art of pure *bel canto*, the style of singing which calls for the nicest adjustment and balance of the vocal means. That such singers as Murska, Krauss, Gerster, Eames, Calvé and Melba were her pupils is sufficient evidence of her skill."

Questions Answered.

[Under this heading THE MUSICIAN will be pleased to answer any questions submitted by its readers which may be of general interest. *All questions must be accompanied by the full name of the questioner.* Answers will be published without such names. Those who send questions should take care to state clearly what information is wanted. Only such questions as will be of interest to general readers will receive attention in this column. All others will be answered privately, for which purpose stamps should invariably be enclosed.—ED.]

R. F.—A Venetian amateur muusician, named Alberti, is said to have invented the arpeggio in 1730. Bach used the mordent, but the date of its discovery is not known. The latter part of the sixteenth century seems to have been the birth of the trill, as it was used by a celebrated singer—Con orti by name—in 1590.

D. B. C.—In this example, from Heller, Op. 47, No. 9,

it is intended to have the double stemmed notes (F) in the bass retained until the expiration of second and fourth counts. The quarter note is worth 4 sixteenths, the first dot 2 sixteenths, and the second dot 1 sixteenth, making 7 in all, which is just the amount contained in each of the bass figures.

G. H. N.—"The Embellishments of Music," by Louis A. Russell, gives exhaustive examples of correct method of playing trills, appoggiaturas, mordents, turns and all graces used in playing, but does not deal with scale playing in double notes. Plain five-finger exercises, such as Schmidt's, are as good as anything else for giving strength, independence and equality to the fingers, and producing smooth playing. Everything depends upon proper use of the fingers and position of the hand. This is where a good, *careful* teacher is needed. It is not only right, but *absolutely necessary*, that a pupil should have some pleasing and instructive pieces before completing a year devoted to *dry*, mechanical studies. Otherwise, it would be musical starvation. Encourage pupils and interest them, but make judicious choice of pieces. The various educational departments of THE MUSICIAN are still open to students; see the rules at head of each department.

G. A. F.—We give the bass of the first *full* measure of allemande by Handel, which begins Grade IV of the National Graded Course.

These are the notes played by the left hand; the others in copy, although on bass staff, are played by right hand. The 16ths have been here double stemmed to show they belong to both parts represented. By counting notes with up stems and those with down stems separately, each will be found to aggregate four quarters, which is the time signature of the composition.

Minnie A.—(1) Age and household work will stiffen the fingers, but to what extent must depend upon circumstances. Practice will overcome much of the stiffness. We would advise you to try it. There is no telling beforehand what may not be accomplished by careful practice; it is surely worth a trial. (2) This mark — over or under a note indicates a firm pressure of the finger or hand, thereby giving a *little* emphasis to the note. (3) The use of the damper pedal —in piano music—is shown by ⌐¬; the pedal being pressed down at the beginning of the mark and raised at the end of it. When used it takes the place of Ped. and ✱. (4) On the piano the effect of an echo is made by playing somewhat softer, generally an octave higher. On cabinet organ it can be done by closing the swell or shutting off the loud stop and using a soft one.

M. E. V.—The Harmonic minor scale has only the seventh raised by an accidental; this is done in both the ascending and descending form. The sixth and seventh are raised in the ascending melodic minor scale, and both are cancelled in descending. Consult Burrowe's Primer for means of recognizing the minor mode. It can be had of the Hatch Music Company at *very* little cost.

ON OPERATIC TRANSCRIPTIONS IN GENERAL; AND "THE MAGIC FIRE CHARM" IN PARTICULAR.

MARIE BENEDICT.

There are wide differences of opinion among musical people as to the value or the nonvalue of piano transcriptions of the music of the operas. Those on the one side, holding that such so-called arrangements of operatic excerpts are "atrocities," "disarrangements" of the music originally written for the voice and orchestra. Those on the other side, holding that, as we cannot always have the opera itself, with all its fascination of action and artistic scenic effect, its charm of vocal solo and concerted numbers, with all the majesty and beauty of orchestral accompaniment and interpretation, as this glorious whole may not be always with us, it is eminently desirable that we should have artistic transcriptions of those excerpts from the operas which lend themselves most happily to the pianoforte setting. There are, of course, transcriptions and transcriptions; some there are, which fail of effectiveness because of the inherent inappropriateness of the subject for the pianoforte; some, because the hand which gave them their pianoforte dress was not that of an artist. But, given the right excerpt and the right transcriber, the result, if not orchestra, vocal solo and chorus, is very, very beautiful, and brings sources of pleasure and of education within reach of numberless people, with which they would otherwise have a far less intimate acquaintance, if, in many cases, any at all.

Special objection is raised by these very critical persons to Wagnerian transcriptions. Most assuredly, the piano cannot reproduce the wonders of the Wagnerian orchestra; but, given the right player, it can render much of the charm and power of Wagner's music, of the fascination of the character interpreting motiven; of the marvels of harmonic effect. Let those who doubt this statement, thoroughly study some of the many settings of Wagnerian themes. For instance, "Elsa's Dream," "Seigmund's Love Song," "Isolde's Love Death," "The Magic Fire" from "Die Walküre," "The Spinning Song" from "The Flying Dutchman," "The Song to the Evening Star," and the "March" from "Tanhaeuser," the latter in the A. R. Parsons edition of the Liszt transcription. And when I say thoroughly study, I do not mean merely the acquirement of facility in the technical work, and of some degree of expression in the melodies therein. I mean that study of every part which listens for and brings out the explanatory undertheme; the practise of each hand's part by itself; that every bit of thematic interest, in whatever register it may be waiting for audience, may be clearly recognized and unmistakably brought out, that it may have its share in completing the charm of the whole. I mean that familiarity with the story of the opera, and with the legends or the history of the time to which it belongs, which will illuminate the portion framed for the piano, and thus enable one more easily to come fully into the mood of the music. "The thinking one's self into the part," to quote from the "Reminiscences" of the veteran actress, Mrs. Gilbert, in comment on how the successful actress individualizes the representation of any particular character.

I have spoken thus emphatically of the necessity of attention to the under themes, because I know how easy it is for the student to become absorbed in the beauty of the upper melody (if I may so express it) at the expense of the wonderful musical and harmonic charm of the themes which lie in the lower registers, in some of the Wagnerian excerpts transcribed for the piano. Let us turn to the pianoforte setting by Louis Brassin, of the "Feurer Zauber," (Magic Fire) from "Die Walküre." But first, a few words concerning the composer, who in this number proved himself gifted with exceptional appreciation of the interpretative resources of the pianoforte. Louis Brassin, who has been termed one of the most musical of composers among the modern Belgians, was born at Brussels in 1840. In his student days at Antwerp, he was the intimate associate of Felix Moscheles, the son of the great technician of the piano, and the late George Du Maurier, whom multitudes so admired in "Trilby," and with whom a smaller number came to feel an almost personal acquaintance through the pages of "Peter Ibbetson." In an article in "The Century" a few years since, "In Bohemia with Du Maurier," Mr. Moscheles gives us interesting glimpses of the personalities of his two confreres and described something of the fellowship of the three friends in the old Dutch town, a fellowship in which the particularly individual charm of Brassin's pianoforte playing had no small share.

"Very noted as a virtuoso, and as composer and interpreter of music of every character," Brassin's work was abruptly terminated by his death in 1884 The world of music is the richer for his life; but we cannot but regret the gain to art that might have been, in composition and in interpretation, had the number of his years been lengthened.

The Magic Fire scene is on a small but lofty plateau, the summit of the mountain, Walkuerenfels, (the rock of the Walkyries). It is the meeting place of these warrior maidens, daughters of Wotan, the greatest of the gods, and the earth goddess Erda, on their way from the battle fields of earth to the halls of Wälhalla bearing with them upon their steeds, the fleet coursers of the air to whom the atmosphere is as the solid earth for their speeding, the dead heroes from the field of war. For the mission of the Walkyries is to fill the halls of the gods with the bravest of earthly heroes, that they may assist in the defense of Walhalla in event of the dreaded attack of Alberich, and his hoards from the under world; for Alberich, Wotan has reason to fear.

But now Bruenhilde, Wotan's favorite warrior daughter, has disobeyed her father's express command concerning the fate of Siegmund, in his recent encounter with Hunding, and the decree of the god has gone forth. Never again shall she ride with her sisters, as on the rushing wind, bringing the bravest of the brave to the glorious halls of the palace of the gods; she shall be changed from her rank of goddess to that of an ordinary mortal, her pleasures and her griefs hereafter to be no more than those of the housewives and mothers of earth. Though the loss of his favorite Walkuere, and the pain he is inflicting upon her cut Wotan to the heart, what has been spoken cannot be revoked; and all Bruenhilde's passionate pleading only draws from him the promise that in the magic sleep in which she must lie on the mountain top, she shall be surrounded by a ring of fire, whose height and intensity shall bar all but the bravest and strongest of men from the possibility of waking her to her mortal life. This promise given, "Wotan, holding his beloved daughter in a close embrace, gently seals her eyes in slumber with tender kisses; lays her softly down upon the green mound, draws down the visor of her helmet, and covers her with her shield, to protect her from all harm."

This done, by his supernatural power he summons Loge, the merry, mischievous god of fire, to his presence, that he may build the cordon of flame about the sleeping Bruenhilde. Presently, tiny bits of fire appear within the magic area, their flash and sparkle continually increasing, until, when Wotan sadly turns away, and walks slowly down the slope of the hill, the glowing, dancing flames have united, and grown into a seemingly invincible wall, the guard of the unconscious Walkyrie.

In the piano setting of the musical interpretation of this scene, we hear first the motive which always characterizes the giants; for the giant Fafnir is now in possession of the Rhine Gold, which lies at the base of the story of the Trilogy, and which is directly connected with the conditions which have led to Bruenhilde's disregard of her father's command, thinking thus to serve him best. The theme is in ponderous unisons; massive, heavy and irrestible in movement, like the personages whom it represents. It is said that the shortening of the dotted half note with which the theme opens, is invariably characteristic of amateur pianists; ergo, here is a point of which the ambitious amateur must beware.

It may not be generally known, that six years before the first production of the "Ring of the Nibelung" at the Wagner Theatre at Bayreuth in 1876, the master sent an agent into Pomerania, the home of the most gigantic physical type of German, with directions to select the tallest and largest men that could be found, having good voices, and to bring them to him, that they might study the roles of the giants under his own supervision, and be ready to sing the parts at the first production of this great life work of his; the longed for event, the time of the realization of which was then in the mists of the future.

At the close of the giants' motive, steals forth the slumber spell, enfolding Bruenhilde in the unconsciousness whose silence shall hold her through the years until the coming of the young Siegfried, the bravest among men, who shall pass the flame barrier, and waken her to his love. Soft, long sustained chords are these, in continually changing harmony, supported, but never overborne by the sweep of long, harplike arpeggios. To see that these long melody tones ring soft and clear to the full limit of their given time, buoyed up by, and never submerged, in the harmonic waves on which they seem to float, requires no small amount of practice and of skill.

But ere long there is an abrupt change in the mood of the music; the lingering chords of the slumber spell give place to the witchery of the first fire motive, and, in obedience to the summons of Wotan, Loge appears upon the scene. This first fire motive, with the constant sparkle and brilliance of the double sixteenths in its high soprano, with its left hand's peculiarly suggestive theme, also in soprano, irradiated now and again by the sudden flash of a short arpeggio, as of an intenser light ray, with its changing harmonic color, as of the shifting tints of the magic fire, so reaches into and illumines the mood and meaning of the old story of the olden time, that the spirit of the scene lives again for us; affecting the mind through its embodiment in tone, as it could in no other way.

Gradually the individual gleams and flashes unite in an ever growing wall of flame; and the second fire motive is set in a continual play of arpeggiated thirty-second notes, ever circling within the octave, as in a wall of glowing color, and ever changing tint. Presently, to the constant accompaniment of the fire music, as in prophecy of the coming of the young hero to waken the maiden from her flame-girt sleep, sounds from the baritone register the Siegfried March, or Siegfried Motive, brimming with the invincible spirit of him whose musical prototype it is As the Siegfried Motive passes, from the bass come the inexpressibly sad and tender tones of Wotan's farewell to Bruenhilde; only a few short phrases, but filled with ineffable love and ineffable sorrow.

Still the fire music flashes and sparkles; and presently, framed, as it were, in its glow, we hear the motive from the Beethoven String Quartet, over which, in the manuscript, the master wrote the interpretative sentence, "Must it be?" A questioning of fate, which the music seems absolutely to voice in actual words. Wagner has here transcribed the phrase with but one alteration, and that not in the melody, but in the under tones of the last chord. With this subtle change in the harmony, the theme seems not so much the questioning of fate in the vain hope of relief from suffering, as the cry of the heart in recognition of the inevitable; before which even the god is utterly powerless.

Slowly Wotan turns and leaves the hill-top; but the scintillant light of the magic fire, and its reflection in the music, hold our attention until distance, or that other curtain, shuts the scene from view.

Is it wise to close the eyes to copies of the great paintings of the old masters because, forsooth, they are not the originals? And is a much greater depth of wisdom suggested by the persistent decrying of operatic transcriptions, because they are not the orchestra, and the great artists of the stage.

In the piano setting of the "Magic Fire," there are several instances of the necessity already referred to, of independent study of the themes in the lower registers. Unless the Siegfried Motive and Wotan's farewell are practiced by the left hand alone, there is great danger that the wondrous charm of these two themes, so strongly contrasted in mood, will be lost by both player and listener in the fascination of the fire music, which is their constant accompaniment. There is the same necessity, though perhaps in a less degree, for the left hand theme of the first fire motive.

It is somewhat remarkable that Vienna should have lost three of its four great composers—Brahms, Bruckner and Strauss—within three years. Goldmarck now has the field all to himself. The Viennese relate that the late Johann Strauss had a great aversion to getting old or hearing any discussion of age, and it annoyed him to have the newspapers talk of his seventy-three years. One day when a lady asked him the age of a certain artist, he replied: "He is quite a young man—sixty-five, I believe." Yet he was far from being without a sense of humor. One day he received a letter from an amateur composer who wanted him to correct a piece he had written, and asked what the cost would be. Strauss wrote that his terms were two cents a bar, and twenty-five cents for each reminiscence removed. With return post he received the amateur's piece—100 bars—with $2.25, the extra quarter being for a possible reminiscence. On another occasion the management of the opera asked his permission for the use of the ballet music in his "Pazman," to save another man's opera from a fiasco. "No," said Strauss, "if my ballet music is to save any one's opera, why not my own?"

A SUCCESS.

The twenty-third annual meeting of the Music Teachers' National Association, which was held at Put-in-Bay Island, Ohio, July 2–5, was a great success. A full report is printed elsewhere. Owing to the fact that a practically different turn was given to the policy of the Association this year, full information of which has been printed in THE MUSICIAN, it is of unusual interest that the success was so great. When it was boldly determined to select as the meeting place a locality where local support was out of the question, and to step out on the platform of a gathering of educators for an educational purpose, it was freely predicted that not one hundred musicians would be in attendance, and that the meeting would end with the Association in debt and with diminished prestige.

●

The meeting has been held and we can estimate the results. And first we are met by the fact that the policy thus inaugurated has met with widespread approval. The attention of musicians of all classes was attracted by it; discussion was aroused and the more it was thought about the more national and perfectly in keeping with the avowed objects of the Association was it seen to be. Consequently a moral support, derived from the approbation and encouragement of influential musicians everywhere was had, which is exerting a beneficent effect upon the future of the Association.

●

It was evident that such a policy as this was directly in line with the educational work inaugurated by the Association at Des Moines. The fact that a continuous educational activity was proposed, with the annual meeting as a focal point having educational dignity, proved that there was a seriousness at the bottom which promised well for the future. This was attractive to those musicians who felt that something more than a musical festival should be the *raison d etre* for associational existence.

●

The rank and file of the teachers of the country saw in it something from which permanent advantage might be derived. Not only would the Association sustain a prestige that would become the property of each of its members, but in the educational work carried on by it there would be valuable aid in preparing themselves for, and sustaining themselves in, their professional career. These are practical matters that appeal to those on whom the Association must depend for support. The problem has been to unite all classes by a policy that appealed to all, and it would appear that a solution has been reached in the activity thus inaugurated. The program of the meeting was arranged according to this policy. The educational features were made prominent, and the concerts were also made exceptionally educational in character, the musical portions being intended to reflect the purpose of the Association as a body of musical educators. No attempt was made to prepare sensational features, all was solid and dignified.

●

The attendance was more than three times as great as the prophets foretold. Three hundred and forty-five teachers were present. The business meetings, held by the Senate and Council on the day preceding the convention proper, were attended by truly representative musicians from Connecticut, Colorado, Illinois, Indiana, Indian Territory, Idaho, Louisiana, Kansas, Kentucky, Minnesota, Missouri, Michigan, Massachusetts, Nebraska, North Carolina, New York, New Jersey, Ohio, Pennsylvania, South Dakota, Tennessee, Texas, Virginia, West Virginia, Wisconsin, who answered to their names at roll-call. These musicians who discussed the questions of policy inaugurated by the administration and, approving them, took action looking to their continuance. Indeed, when the recommendations of the president's address were being discussed, some prominent musicians, who had been active in Association affairs during its most successful period, became very enthusiastic and announced their hearty allegiance and their determination to support the projects under discussion. The result is a new impetus to the work of the M. T. N. A. New vigor has been infused into it, old and new members, those who were its stand-bys, when it was at the top wave of its glory, and those who have come into it recently are moving, shoulder to shoulder, under a banner which bears the watchword, "Education."

●

The meeting place met with universal approval. The feeling of fellowship, engendered by the entire membership being housed under one roof, was in itself a stimulating feature. There grew, from the first day until the close, a sense of union that was both helpful and gratifying. The entertainment was all that could be desired and satisfaction to the extent of enthusiasm reigned. This had its demonstration in the choice of the next meeting place. Invitations were received from the South, from Indianapolis, Ind., and from the management of the Hotel Victory. According to the constitution these were posted for action. In the meantime the opinion of the delegates that the policy of the year should be given ample time for a true testing, and that the perfect adaptability of the present meeting place was apparent became so strong that when the time for action came, all invitations were withdrawn in favor of Put-in-Bay, and a unanimous vote was taken to meet there in 1902.

●

Now what are the general results? First, the meeting, program and all, has been given universal commendation, and those who were present have returned to their homes more than pleased, feeling that they have received direct personal benefit. Second, the educational policy has received the approval of musicians whose positions as educators give their approval intrinsic value. Third, this policy is established on a working basis by the acts of the Association and the Educational Board will be able to take hold of the work systematically and thoroughly. Conferences will be held and when the time for the meeting of 1902 comes, results will be apparent. Fourth, the Association rallied to its standard a body of musicians whose power and influence will lift it upward and onward. Fifth, it begins its new year with a balance in hand.

●

These results have been achieved by the devoted work of those who, for the past years, have lifted the M. T. N. A. out of debt and carried out its avowed policy. Now, what is the duty of the profession? It cannot now be truthfully said that the M. T. N. A. stands for nothing. Nor can the question, "What good will it do me?" be asked without having a satisfactory answer. To one who is sincere in asking that question and investigates comes the conviction that there is much good that it will do him, if he but takes hold and do his part.

●

In view of these facts it is safe to say that the time has come when every thoughtful, earnest, ambitious music teacher and student owes it to himself to join the Music Teachers' National Association and unite his efforts to those of many fellow-workers in carrying on an educational scheme which has behind it the brains and force of some of the best men and women in the musical profession of the country. There should be no hesitation. Data is ready for those who wish to investigate, and both subject and opportunity are worthy the careful attention of all who really love their art.

●

A LESSON FOR TEACHERS AND PUPILS.

"A well-known Dean, now deceased, was in the habit of telling the following humorous story:

"A couple of frogs—one a pessimist, the other an optimist—took a stroll into the country and, in the course of their peregrinations, came to a dairy. On the floor of the dairy were some pans of milk into which the frogs fell. The pessimist swam and struggled and struggled and swam, but was unable to get out, so he gave up the ghost.

"The optimist, too, swam and struggled. But, unlike his fellow-unfortunate, he kept up a good heart, and swam and struggled and struggled and swam until, at last, through his exertions, the cream was churned into butter and he sat on top of it!"

One often wonders why failure comes when, according to indications, success should be achieved. Various reasons are assigned, many of them doubtless true, but we often fail to perceive that we carry within ourselves things that make for failure when our talents and opportunities should bring the opposite. Braveheartedness is a happy attribute. More than one unfortunate has gone down in life's battle because his viewpoint was dark. We are all susceptible to the influences of emotion, and particularly is this true of the musician. The teacher who looks at things from the dark side is half beaten in his struggle at its very beginning. Muscle tires more quickly when courage gives out. This is why athletes lay so much stress on having "sand." The man who has "sand" does not know when he is beaten, his courage rises after every disaster, muscle and mind work together, and he can see gain even in defeat.

●

The pessimist teacher is a trial to himself and to his pupil. His gloomy nature distils discouragement and deadens the thought, the inspiration, the power of those who try to work with him. He can never hope to sit on the butter. He will always be striving hard to keep his head above the surface with force and will weakened by his pessimism. Not so with the optimist. His buoyant nature withstands discouragement and exudes cheer and strength of purpose. Both he and his pupils do their work in an atmosphere of inspiration, which incites to greater efforts.

●

Fellow-teachers do not emulate the pessimistic frog, but struggle until your exertions churn adverse circumstances into that which will support you, rather than drown you in a sea of trouble.

The vacation time will soon be over, and even now thoughts of coming duties of future activities are pushing themselves within the horizon of our mental vision. It will be well to devote a little time to concentrated thought and planning. Do not enter upon your new season without carefully formed plans.

THE LIFE BELOW ITS BEST.

I sometimes wonder if we think, or care,
How courage fails the hearts we hold most dear,
How they their burdens less serenely bear
Because we live our lives too meanly here?

They have such noble thoughts of us; and we,
Alas! pursue our ways of weak content
With trivial things, nor ever seem to see,
As they, the grander, finer thing God meant.

What subtle heartaches steal their joy away,
And cloud the hopes that make men brave to do,
Just through that disappointed love, that may
Not take fresh heart o'er best of me and you!

Ah! not alone our own poor lives we cheat
Of higher things, of what we might have been,
But with indifference we clog the feet
Of those who else might peaks still higher win.

Thiuk, selfish one, of this, when ease entreats,
Or pleasure, to a life of common dross—
How every yearning human heart that beats
For you shares somewhat of your greater loss.

—*James Buckham.*

GIUSEPPE VERDI.

ALFRED VEIT.

Italy is still ringing with the echo of Verdi's name. In all the cities of the peninsula, large and small, crowded concerts are given for the purpose of honoring the memory of the great composer, the last one of prominence having been organized by Mascagni at Pesaro. Books, pamphlets, magazine articles, all treating of Verdi, are flooding the market, and day by day this number is increasing. The popularity of the Titian of music—as he has been called—is gaining in strength, rather than falling off. From prince to pauper every one is whistling, humming and strumming Verdi's melodies. The condition of affairs is similar to that described by Heine in reference to Weber's music in Berlin, where it seemed as though even the dogs in the street were barking the melodies of the "Freischütz."

While I am writing this, a barrel-organ below my window is rattling away at the "*Diquellapisa*" from the *Trovatore*, the only melody the unmusical Cavout ever could remember and repeat.

Oh! that the authorities had not fixed their canon against the slaughter of barrel-organists!

Illustrating the care with which Verdi superintended the rehearsals and all the details pertaining to the bringing out of the work, Barbieri Nini, who created the part of Lady Macbeth, relates the following: "The piano-rehearsals together with those of the orchestra, included more than one hundred, as Verdi was never satisfied and always insisted upon getting better results. It seems incredible, but it is, nevertheless, true that the sleep-walking scene was tried for three months, day and night. For three months, I tried to imitate someone walking in his sleep, someone—as Verdi put it—who, while closing his eyes, produces words without moving his lips or the muscles of his face. . . . It was enough to make a person mad. . . . The duet with the baryton was tried one hundred and fifty times, so as to produce the effect as though the words were more spoken than sung. At the dress-rehearsal, Verdi insisted upon a private rehearsal of the duet, although the soloists and the orchestra were waiting to begin. The baryton, put out by Verdi's persistent demands, exclaimed rather testily: "Why, we have tried it one hundred and fifty times." Thereupon, Verdi answered: "You will not be able to say that in half an hour from now, for in that time you will have tried it one hundred and fifty-one times." Barbieri Nini continues: "It was impossible to disobey the commands of the tyrant. I still recall what a terrible face the baryton made behind the composer's back, as though he wanted to stab Verdi, just as he had to murder King Duncan later. Nevertheless, he gave in and the one hundred and fifty-first rehearsal took place while every one was waiting. The enthusiasm called forth by this duet has never been equaled. Whenever "*Macbeth*" was performed, we were obliged to repeat the duet, even sing it three and four times. A certain evening we were forced to sing it even five times."

In the Spring of 1887, the present writer visited Italy and formed part of the audience at the first performance of *Othello* in Venice at the Teatro la Fenice. Tamajno took the part of the moor of Venice and Maurel was the Jago. The city was in a state of excitement weeks ahead. Everybody was on the tiptoe of expectation. The performance of a new opera, and especially one of Verdi's, was a great event. From the moment the late Faccio raised his baton to the entrance of the exultant Moor, an unbroken silence reigned in the theatre. But the delirium that ran through the theatre after the first act! Again and again the artists were called before the curtain. The enthusiasm was such that the calm observer looked on in utter amazement. Maurel was obliged to repeat the *Credo* several times before the excitement of the crowd abated so as to permit the continuation of the performance. The *Ave Marie*, in the last act, was also encored several times. The success of the opera was a complete one. It was a great night and a great triumph for the absent composer.

After *Othello* the pen of the composer remained silent for several years. Then, in response to the inquiries of many friends, he wrote: "After having produced tears and given rise to thrilling emotions, after having killed so many prima donnas and tenors, I take it, that I also have the right to rest and to laugh and make others laugh." And the result was—*Falstaff*.

The music of *Falstaff* does not ring with the laughter of youth nor does it sparkle with the buoyancy of the Spring-time of life; it rather crystallizes the dreams of the epicure of the philosopher who has penetrated into the mysteries of life and discovered the "vanity" of all things, and the consequence was that, despite its splendid workmanship, the music of *Falstaff* has never received the undivided admiration of the public. But Verdi was satisfied. The Jupiter of Bosseto had descended from the heavens to frolic with the pigmies of the earth, from whence he returned to his Olympian heights, there to receive the repose he had so richly merited.

The chief characteristics of Verdi's music are spontaneity of invention, vigor, richness of melody and facility of workmanship. The qualities were shown in a long list of works as varied in character as they were novel in form. Without working to the harshness of the ultra-modern school as illustrated by the younger composers, Verdi shows a certain ruggedness of expression which, nevertheless, rarely fails to appeal to the sympathy of his audience. Such wealth of ideas! One page of one of Verdi's operas is worth more than ten of the works of some of the musical bantlings whose productions are now inundating the stage.

His melody flows unceasingly without effort and assumes a form both pleasing to the layman as well as interesting to the professional. This quality—the crucial test of universal art—is evidenced in his greater works From the popular chorus of *Nabucco* to the fuge in *Falstaff*, Verdi's genius expressed itself in musical language that appeals to all nations and all races. Listen to the pathetic pleadings of Violetta! Or mark the ecstasy of Aida and Rhadames during the final scene in the Egyptian temple! Excepting in Wagner's scores, has dramatic music ever found more passionate accents than in these scenes?

Italy has probably never produced a composer whose melodies found a readier response in the hearts of his people than Verdi's. And yet his popularity is not due alone to the charm of his music; his qualities as a man, his modesty, the manner with which he avoided all publicity and notoriety, and above all things, his patriotism, made him the idol of his people.

Although as an artist Verdi endeavored to attain the highest conception of art, he never lost sight of one aim and that was to remain Italian in style and in the superlative of national art as conceived by him.

This point must always be borne in mind by the student of Verdi, as it furnishes a very essential clue for the comprehension of his music. His biographers and commentators lay particular stress upon this Italianista, or personification of the Italian spirit, and agree with singular unanimity in considering it one of the distinguishing features of his work.

In his first efforts, Verdi was justly accused o depending solely upon the gifts with which nature had endowed him.

They did not reveal the finished master-hand that subsequently became evident. A certain laxity in workmanship proved that he had not bestowed the same care and thoroughness upon his earlier scores that became the distinguishing features of his later works. In his younger days he was still under the influence of his predecessors. In the course of time he freed himself, however, from this temporary weakness and followed the dictates of his own genius. In so doing he opened up new paths, made new incursions into the realm of art and presented the musical world with results that will live long after the ephemeral products of the present day have passed away.

ROME, March, 1901.

FRIENDSHIP WITH BOOKS.

FRANCES C. ROBINSON.

With the exception of heredity and our material surroundings, perhaps no influence is so powerful as that gained from the books we read. When young people first feel this book influence, and realize that their reading is helping them to grow in knowledge and in character, there begins to stir within them a love for books, an affection similar to that which we bestow upon friends who are a help and an inspiration to us. Books should be our friends, and a book that does not help us in some particular way is worse than useless. Sometimes it is mere relaxation and entertainment that we need (to counteract the strain of our duties) therefore light literature, if it is pure and clean, and true, is all right and has a work to do for us. But there are times when one longs for something more than mere amusement, and good books are so accessible we have but to choose and we find a bounteous feast at our disposal. At times we wish to read for information and this leads us to keep up our reading of biography, history, travels, etc. (adding to these the classics if we are so disposed); but just as, in life, we seek that man or woman who affects us for good, so we look for books that will help us, and when we find what we look for we prize it accordingly. Such books must be owned by us, so that we may turn to them again and again. Among my books are a few to which I go for help, just as I should to a dear friend, when feeling the need of a certain kind of influence or help. They comfort one and strengthen and encourage one to continue reaching out toward the ideal. To mention a few of the books that I prize in this way there are Hamilton Wright Mabie's Essays. His books "The Life of the Spirit," "Essays on Nature, etc." and "Essays on Books and Culture." Then there are two books by the late Rev. James Freeman Clarke, of Boston, "Self Culture" and "Every Day Religion."

The first chapter of "Self Culture" is entitled "Man's duty to grow," and no one can read it without resolving to use all the means in his power to grow in character, to aim at being his best and truest self. The first chapter of "Every Day Religion" is entitled "How to make the most of life," and it not only tells us how, but assists us to do it. Each chapter, of both Dr. Clarke's books, is just so much personal help from one of the best men who ever lived. The love of nature is one of the most important elements of modern life. It gives one poise and serenity. Sympathy with nature is the remedy for many a sorrow. If we study nature, not analytically, but more as the poet does, we shal find that it will bring us joy and peace. Direct contact with nature is denied to many of us, but books come to our aid regarding this, too. We can have access to the writings of those who love nature and who live close to her. In Mr. Mabie's "Essays on Nature," we do not read further than the first two or three pages before we feel an inflow of life. How much he has to say of the "mysterious fellowship" which exists between us and nature, and in what finished language and style he puts what he has to say. In his book, "The Life of the Spirit," there is one chapter entitled: "The Companionship of the Sky." If, as I said above, direct contact with nature is not possible for us all, here is one "Companionship" that we all can avail ourselves of—that of the sky.

Other books worthy to become our friends are the works of such writers as Emerson, Thoreaun, John Burroughs and of the poets, Wordsworth and Barnes (English), Whittier, Longfellow and Whitman of our own country. There are but a few. The lover of books is always finding writers who have something to give which he reads, and the books are legion which take us out of all narrow ways of living and lift us above the common thinking of ordinary life. Musicians, of all people, read ever before them the highest ideals of life. Realizing that ours is a sacred calling, we must endeavor to bring to it the best influences possible, and we need the great help of a close friendship with books.

Music is the soul-language. It utters what words cannot express. It is possible that music shall be the language of Heaven, and that thereby our daily or hourly utterances become praise. The grandest music that earth ever heard must have been that sung by the angels when they announced the birth of Christ and sang that beautiful sentence, "Glory to God on the Highest, on earth peace and good will toward men." Ever since the time when the morning stars sang together, until now, music has been a means of praise, and this glorious position our dear art shall enjoy throughout eternity.—*From Northwest Journal of Education*

THE NEW EDUCATION.

FOREWORD.

The *New Education* offers its readers, for 1900–1901, the best plan for a year's study that it has yet presented. It will be the best in two particulars: In choice of subject matter and in manner of presentation. The hearty reception which this novel educational feature has met with makes it possible for THE MUSICIAN to continue to develop the idea of home music study and to offer the best advantages that are to be attained in this manner.

The series of subjects for the coming year follows. Each subject is in the hands of a specialist and will be treated practically and as fully as possible in twelve lessons. In order to meet the immediate demands of students who seek information on special points in the work, the editors will be glad to furnish

Suggestions for the further study of any subject.
A bibliography of any subject.
Information on any question in the lessons.
The consideration, and, if necessary, the presentation, or general discussion of any point that comes up in actual teaching.

The subjects for the coming year are as follows:

I. Advanced History of Music; twelve lessons, with suggested reading.
II. Psychology and Pedagogy of Music; six lessons in each subject; suggested reading.
III. Advanced Music Form; twelve lessons developing those already given in this department.
IV. Harmony and Melody; twelve lessons; six in each topic.
V. The Literature of Aesthetics and Criticism in Music, twelve lessons.
VI. The History and Development of the Piano, twelve lessons with illustrations.

The following conditions *must be observed:*

1. Address all communications for the *New Education* department, thus: THE MUSICIAN, New Education Department, 8th and Locust Streets, Philadelphia, Pa.
2. *Do* NOT *roll your manuscript.*
3. The answers for each month must be sent as soon after the issue of the journal containing the subject to which they relate as possible, and before the next succeeding issue. No papers are to be held until end of course. New members can join at any time by sending names and answering questions contained in current issue.
4. The editors are obliged to say that no papers will be read or rated that fail to comply with conditions 3, 4, 5 and 6.
5. No two subjects should be written on one sheet. All sheets pertaining to one subject—for example, History—should be independently fastened.

Ratings will be largely influenced by the following points:

Accuracy.
Clear, concise, yet smooth diction.
Grasp of the subject.
Originality of thought and statement.

The questions following each lesson have two purposes: First, to connect the reader's mind directly with the text—the most fundamental, that is, the lowest duty a question can serve, but necessary. Second, to suggest a thought beyond the mere expression of the words in the text; the highest purpose a question can serve. The first is by far the least useful if he has a memory; the second the most useful if he has a reasoning faculty.

The editors will welcome letters from teachers which contain:

a. Suggestions as to what will make this department more valuable, the suggestion being dictated by the teacher's individual experience.
b. Statements regarding the application of this work with pupils as well as in one's own effort to secure a broader education.
c. If there is any line of thought of practical value to you, and likely to be equally practical to others, let us know it.
d. All such suggestions must be sent to the office of THE MUSICIAN, addressed according to direction given in regulations.

[NOTE.—*New Education* students are specially requested to avoid enclosing *anything* relating to their business with the Hatch Music Company with their *New Education* papers. The failure to comply with this rule causes great trouble. Kindly keep this matter in mind. We wish to call the attention of our students to the necessity of *fully prepaying postage on their papers.* We have been compelled to pay additional postage on a large number of those already received. This should not be, hence we request our students to take care that sufficient amount of stamps be affixed before mailing.]

IX—INFLUENCE OF THE RENAISSANCE: II, REVIVAL OF THE DRAMA.

PERCY GOETSCHIUS, MUS. DOC.

As stated in the preceding chapter, none other of the characteristic products of musical growth during the sixteenth century traces its origin so directly to the revival of letters as does the opera. In truth, this secular dramatic form of music may be regarded as the culmination of the influences of the Renaissance, as far as our art is concerned; and its significance in music history can be measured by the fact that this revival of the drama, in the opera and kindred forms, marks the most momentous turning point that the history of the art has ever witnessed. It signalized the ultimate complete emancipation of the tone-art from the jurisdiction of the Church—its transferment from cathedral and cloister to theatre and private study—from the comparatively narrow sphere of unimpassioned and ofttimes insincere religious emotion, to the illimitable ocean of broad human feeling, and passion, and beauty.

Not that the drama was *born* at this time, of the Renaissance agitation; it is the revival of the drama of ancient Greece (where it had attained to greatest perfection and sublimity), and the infusion of its spirit into the music art, which is pre-eminent among the beneficent and inspiring consequences of the revival of letters.

"The dramatic propensity is as old as humanity," says an able historian, and, one might add, the drama has never ceased to be one of the most instinctive and irresistible of human pastimes. For it is the playground of grown-up children; the natural medium for mirroring conditions, real and ideal, upon which we love to linger. And, what is greatly to the point in the present connection, it is the great champion of musical freedom; the true and proper sphere for the revelation and development of all that is most powerful and lovely and significant in tone-life.

The oldest distinctive dramatic form in music (not to speak of the unimportant associations of music with primitive dramatic action in the rude French *vaudevilles* of earlier centuries, or the still ruder *Mysteries, Passion Plays* and the like), is the *Oratorio.* This, however, is so much less characteristic of the ruling dramatic impulse of its day than is the opera, and antedates the latter by so few years, that it may be dismissed in this brief treatise with a simple reference to its nobility and dignity among the forms of musical creation.

Centering our attention then upon the *Opera,* as chief exponent of the drama in music, we learn that it owes its inception directly to the determination of a few learned enthusiasts to revive old Greek tragedy. It is a familiar old tale, but merits another recital here:

In the house of Giovanni Bardi, a descendant of an aristocratic Tuscan family and an ardent patron of art and artists, there assembled, near the end of the sixteenth century, a brilliant circle of gifted men and scholars, well versed in ancient poetry and art, and thoroughly imbued with the progressive spirit of the age. Here was conceived the idea of placing the dramas of Sophocles and Aeschylus again upon the stage—*with appropriate music.* Much keen speculation was spent upon the probable nature of the original music prescribed in these dramas. They were unanimous in their denunciation of the existing styles of music, with their "artificial, incomprehensible twists and turns," and zealous to correct and promote musical expression. Of the gifted and trusted tone-masters to whom the tasks were assigned, including Cavalieri and Peri, the latter (Peri) seems to have been the most successful. He produced "Daphne" in 1594, and "Eurydice" in 1600, the last of which is generally accepted as the work with which the history of the opera, as a distinctive music-dramatic form, begins.

In tracing the earlier experiments which led up to these primitive specimens of real operatic form, we cannot deny the importance of those common and often very elaborate *Masquerades* and mythological or allegorical plays with song and instrumental accompaniment (choruses, recitatives and dances), so popular at Italian courts during and before the sixteenth century. Even the great Zarlino took part in the preparation of the music to some of the latest of these (1574). Important were, further, the *Pastoral Plays* (among them the famous "Pastor Fido," Ferrara 1585); and, most significant of all, the *Intermezzi,* so called because they were introduced between the acts of dramatic presentations. It is apparent from this, that there were symptoms of a coming dramatic style of music some time before the so-called opera form was consummated. These were, however, only symptoms and no more; the music was not inspired by an obvious dramatic purpose, and scarcely differed at all from the spiritless drone of other musical functions. In the opera *a real union, a growing assimilation of the dramatic with the musical elements* was realized, and this it was which characterized the new form and the new era of music life. This it was, that at last touched the long hidden spring of music's real power—that pointed out the path which the art was singularly fitted and naturally destined to pursue—that, in a word, infused a soul, the "breath of life," into music. And this is the great obligation that music owes to the resuscitation of the ancient drama.

Of the countless benefits which the technique of music quickly derived from her new alliance—episodes so swiftly enchained with one another in the speedy development of her freedom that they can hardly be distinguished—but a few need be mentioned here. Monteverde's opera, "Ariadne" (1608), is said to exhibit the first free employment of the dominant seventh chord. The uncertain and inflexible ecclesiastic "modes" were entirely abandoned, and the present major and minor modes firmly established. The old monotonous, spiritless recitative-intonation gave way to a passionate dramatic declamation of truly great power and beauty; and measured solo-song (aria and cavatina) developed rapidly. But, most of all, *instrumental* music found herein a new and fertile field. All the laborious acquisitions of this domain of technique during the foregone century were accumulated and directed toward a common center. Not only did the primitive body of instrumentalists which accompanied the singers in opera gradually and naturally develop into the modern orchestra, but coincident with this evolution came the discovery of unexpected powers of *independent* musical expression which were destined in time to give birth to the symphony, to chamber music, and other triumphs of what is known as "absolute" music.

QUESTIONS.

1. State the relation of the opera to the Renaissance.
2. What did the union of drama and music signalize?
3. Which is the oldest distinctive dramatic form in music?
4. Which is the chief exponent of dramatic music?
5. Relate the incidents that led to the inception of the opera.
6. What musical practices had paved the way for it?
7. What union takes place in the operatic form?
8. Name some of the beneficent results of the new style.
9. To what did the instrumental accompaniment lead?

FORM—NINTH LESSON.

Constructive Form.

THOMAS TAPPER.

If the student will look through a text-book on Music Form, that by Ludwig Bussler, for instance, he will find that it is recommended to use the compositions in small forms in the structure of higher forms. The main purpose of this is to bring it to the student's mind that music composition presents a well-ordered, systematized, highly developed working out of a simple initiatory proposition. One may prove this satisfactorily by patiently reading, let us say, the G sharp minor Fugue of Bach, from the first book of the Well-Tempered Clavichord. Play the subject and the counter-subject until you are thoroughly familiar with them. Then play each voice part throughout, marking off those measures which, in whole or in part, are built upon Subject or Counter-subject. Even going no farther with the process than this, one will be surprised to note the number of measures which spring from the few measures of Subject and Counter-subject.

If, while we have the Well-Tempered Clavichord in hand we look through a few of the Preludes and Fugues, we shall be surprised to learn how small a seed gave birth to many of the plants of this particularly rich garden; and we may rightly conclude that

the composer must be an economist of the highest order.

THE PERIOD.

Before beginning to compose melodies in Period form, the student should review what was written about the Period in the First Series of Form Lessons (see THE MUSICIAN, November, 1899, to October, 1900). This review will remind us that an eight-measure period has this appearance:

PHRASE I.	PHRASE II.
4 m.	4 m.

That is, it is a pair of Phrases, each of four measure, and (as the nature of the Phrase is to cease, to conclude more or less satisfactorily) with a Cadence in measures four and eight. If the Period is a complete musical thought, in the composer's mind, ending upon the Tonic (as the case is, in the tune *America*), there should be at measure four a cadence of contrasting nature. This is commonly the Half Cadence; that is, a point of repose upon the Dominant, harmonically; and upon one of the tones of the Dominant chord, melodically. Hence, upon G, B or D in C major.

We now know the content of the fourth and eighth measures of our first melody: measure eight will contain the Tonic of the Scale; measure four will contain a tone of the Dominant triad.

If we employ the Phrases already composed as the basis for the Periods we are making, they will become the *final* Phrase of the Period because they end on the Tonic. And their conversion into the Period structure complete merely requires that we so alter the trend of the melody that it does *not* end on the Tonic (but upon the seventh, second or fifth of the scale) and we have a Phrase which serves for the opening of the Period.

Let us state this fact another way: Write the Phrase with ending *off* the tonic, rewrite it with ending *on* the Tonic; play both in the order given and a Period results. The wording sounds like a cook-book recipe; but it is worthy of our respect. It is a formula on which all the great masters have expressed many thoughts. Its simplicity makes it clear and its economy makes it artistic; it needs genius to make it beautiful.

The students will see by inspecting his first Period that if he has obeyed the precepts he has really made his eight measure period out of five measures of music. For, while measures four and eight are unlike, one and five, two and six, three and seven are identical. This is the first lesson in economy of the use of material. But, to make the lesson impressive, the student must observe it as practiced by the best writers. Let him look patiently through the Mozart Sonatas to find (1) Periods of the above described structure; (2) Periods of other lengths, and note the economy in the use of material combined with the simple expression.

EXERCISES.

1. Write Periods in various major keys; Phrase I to end on a tone of the Dominant Chord; Phrase II to end on the Tonic. Measures one, two and three to be respectively like five, six and seven.
2. Write Periods in various minor keys; Phrase I to end upon a tone of the Relative Major Triad; Phrase II to end on the Tonic. The structure otherwise to be as in the preceding exercise.

THE MINOR SCALE.

H. A. CLARKE.

In the first paper in this series a slight reference was made to the minor scale, but it is a subject that demands much fuller treatment. It is impossible to say anything about it without some reference to that vexed question—the Greek scales—because our art of music was a sort of chance growth or discovery made by men who thought they were simply walking in the paths laid down by these old Greeks. There seems to be no doubt that the principal or normal Greek scale was—the minor scale—in what we call its natural form; if its history is to be believed, it came into existence thus: The first four sounds—E-F, G-A—called the pythagorean tetrachord, but in all probability of Egyptian origin, are assumed to be the beginning of the scale. Add another series of the same kind, but beginning with the last letter of the first series, thus: E-F G-A, A-B♭, C-D, and we have the heptachord scale of early Greek music. Add the D below, thus: D, E-F, G-A, A-B♭, C-D, and we have the Dorian Scale, the normal Greek form, exactly like our scale of D minor, except that all the intervals in it were (theoretically) in perfect tune, while none of ours but the octaves are. If, as claimed by high authorities, the rest of the Greek scales were simply transpositions of this, *not* rearrangements of the tones and half-tones, as in the ecclesiastical scales derived from them. All Greek scales were natural minor scales.

Whether this is or is not the origin of the minor scale, is of very little importance. The fact being that the distinction between major and minor could not exist until harmony was discovered. Saturated as we are with the harmonic constitution of music, we are incapable of putting ourselves in the position of a people to whom harmony was unknown and to whom *music* meant simply melody.

The melancholy tinge that we ascribe to the minor scale would seem to be a comparatively modern feeling. Judging from the fact that the greater part of the dance music of the sixteenth and seventeenth centuries was written in the minor key. It is a curious fact in the history of music that the three great symphonists—Haydn, Mozart and Beethoven—used the major in preference to the minor key, and that the reverse is the case with their successors; it is an indication of the intensity of modern emotion and, perhaps, of its pessimistic tendency: "Sicklied o'er with the pale c st of thought." That the minor scale is not a natural product is evidenced by the fact that the exigencies of harmony make it necessary to change two of its sounds; it was not until harmony was thoroughly understood that the proper use of these changeable sounds was definitely fixed. Thus, Bach and Handel often used the raised 7th and 6th in the descending scale, where a more modern writer would use the natural or harmonic form. For example, there is a passage in descending scales in the second part of that solo in the "Messiah": "But who may abide the day of his coming." That is rarely, if ever, sung correctly; it is as follows: G down to G, with B flat; then A down to A; then B♭ down to B♭, each time with F♯ and E♮. A modern singer is almost sure to make the E♭, and to make the F♯ when the dominant harmony accompanies the passages, and natural when the tonic harmony accompanies it. The minor scale has proved a puzzle to the theorists, owing to the fact that the minor chord cannot be accounted for, acoustically, since the third over a root must be major. One of the most singular theories about it is that put forth by Dr. Riemann, viz.: That it is the major scale turned upside down, and that the *roots* of the chords are at the top. The chords being formed of the *undertones* of these roots the theory is ingenious, but it is necessary to prove first the existence of *undertones;* it is easy enough to understand how a vibrating string may be divided into equal parts, each division giving an overtone of the fundamental, but to make it vibrate in multiples of itself is like making a pint measure hold a quart, confessedly impossible, except to strawberry merchants.

It is a great mistake to confine the expression of the minor scale to the lugubrious, tearful emotions; it is perfectly capable of giving vent to widely different feelings. Witness the stern dignity of the opening chords of the Ruy Blas Overture, the wild Bardic fervor of the "Song Without Words," No. 23, or the cynical gaiety of Casper's Song in "Der Freischütz" or Mephistopheleles's Mocking Serenade to Margaret in "Faust."

In short, scales, chords and rhythms are no more than the material with which the musician works. They are pertectly plastic in his hands and he can give to them, through the alchemy of his genius, any expression he may desire.

It is one of the privileges of genius that it intuitively finds the right way, unconscious of the process by which its results are attained. If a composer sits down to calculate what mode or key or rhythm he shall use to express some musical idea, the chances are that, by the time he has finished his calculations, his inspiration has oozed away, far be it from us to convey the idea that great music is made without thinking.

Inspiration supplies the motive only; thought and work are necessary to make it valuable. A diamond is an unsightly thing, though valuable, as it comes from the mine. It requires the patient work of the lapidary to make it the glory of a monarch's crown.

THE DEVELOPMENT OF THE PIANO.

FRANCIS L. YORK.

The piano, as described in our last number, now stands a complete work of art, perfected by the patience, skill and experience of musicians, scientists, metallurgists, cabinetmakers and piano players themselves. The making of a fine piano requires the knowledge and skill of so many kinds of workmen, it presupposes so high a development in so many arts, that it is no wonder that it took so many hundred years to bring it to perfection. One very important material used in the piano we have not as yet mentioned, that is, *felt*. All the early pianos had hammers whose heads were made of, or at least covered with, leather. The use of felt has entirely superseded that of leather as a covering for the hammer-head. Many improvements have been made in the felt used for this purpose, until the material now used in the best pianos can hardly be bettered. Most of this felt was imported until within a few years, as the felt made in this country was not of a sufficiently good quality, but of late years, largely owing to the skill of Mr. Alfred Dolge, a felt has been produced in the United States that is as near perfection as we can hope for. Any material will in time wear out, and felt is no exception to the rule, but the best felts now made are composed of long, fine wool, beaten into such a compact mass that it is only by constant and long continued use that it becomes worn.

Even in the time of the harpsichord, as we have seen, a great many so called improvements and additions were introduced into our instrument. Some of these we have mentioned or partly described. It would not be wise for us to try to decide just what changes may legitimately be made in the piano or what additions made to it. But it would seem that any addition or change that has for its object the destroying of the distinctive character of the piano, or the adding of effects that are totally foreign to the piano nature, must result in producing an instrument that is no longer a piano, or else must produce a very inartistic whole. Any progress toward perfecting the piano *as a piano* must be along the lines of the piano as at present made. If pianomakers can give us an instrument that is lighter, more compact and of less cost, of more graceful outline, of greater durability and of more sustained tone, all musicians will welcome these improvements. If some device could be invented by which the player could control the tone after it is once made, that is, could increase or diminish the tone or prolong it at will, many new and very beautiful effects could be attained that at present are impossible. It is just in this that the weakness of the piano as an instrument lies—in the fact that every piano tone is, in reality, a *diminuendo* tone, it cannot be increased, it cannot be prolonged beyond the sustaining power of the instrument, and the player cannot hasten the rapidity with which the tone dies away. It is often very easy to trace the effect of these limitations on the composer when writing for the piano, we may even find at times that the composer has overstepped the possibilities of the piano and indicated effects that would be easy on the organ or with some orchestral instruments, but cannot be produced on the piano. This is particularly true of effects produced by the use of the damper pedal. It is not uncommon to find a passage in which a single tone should be sustained throughout and this can only be done with the damper pedal, as the hands are engaged elsewhere, and yet if the damper pedal is used the result is an intolerable blurring of the other tones. See, for example, the Chopin Prelude, Op. 28, No. 17. To remedy this the sostenuto pedal has been devised, and it is to be found in slightly different forms in many pianos. By the use of this pedal a single tone or any combination of tones may be held quite independently of the other tones, the player having entire freedom in the use of either or of both of the other pedals, of any key on the piano, including the keys already held. The result is brought about by a simple contrivance which keeps the dampers of the desired keys from dropping on their wires while still leaving the rest of the action free.

Such an invention as just described is of real artistic value, but many of the following can only be regarded as curiosities or as "freaks." About the time that the piano began to be commonly used, the makers of clavichords, harpsichords and pianos seemed to be possessed of a sort of frenzy to add "new inventions" to their instruments. In the case of the older instruments this may have been merely a struggle for exist-

ence, as the new piano bade fair to supplant them entirely, but the makers introduced the same devices also into the new pianos. It would take many pages to describe all the numerous "new inventions" that were advertised. In 1783 Cramer says of them: "The gentlemen are so fond of inventing, even though it be naught but new names." These inventions consisted of stops, pedals, knee swells and even contrivances to be held in the mouth, by which the tone of the instrument could be made louder or softer, the pitch could be transposed, and other instruments, such as the flute, the bassoon, the harp, the lute, etc., imitated. It is probable, however, that these imitations were not very exact, for in one instrument, which was supposed to imitate the bassoon, the effect was produced by letting down a sheet of paper on to the strings so when struck they gave out a jarring sound—a proceeding that rather recalls to us some of our own childish pranks than gives us a high idea of the musical taste of our forefathers. Other inventions of more or less importance were two instruments in one—as a piano and a harpsichord in the same case. Also double pianos with a keyboard at each end, and extremely small pianos that could be carried about in a trunk. Probably the culmination of all these monstrosities was an instrument made by a certain Herr von Blaha, in 1795, which contained, besides the piano, a row of keys for a couple of organ stops, a drum, a triangle, fifes, bagpipes, castanets, a bassoon imitation, played by the performer by a holding a pipe in his mouth, and, most wonderful of all, a storm effect in which was heard the howling storm, the clattering sleet and the rolling thunder. To this the performer sang a "lovely descriptive aria until the war of the elements was tranquilized." Just how he contrived to sing with his mouth full of "bassoon" pipe, history does not inform us.

There is another class of instruments, however, that deserves some notice from us, namely, the piano-violins. In these instruments an attempt was made to set the string in motion by a resined bow of some kind, the tone produced being much like that of the violin. These instruments were never very satisfactory on account of the difficulty of keeping the large number of strings in tune and also of insuring the immediate sounding of the tone by the bows or by the resined wheel that in some instruments took the place of the bow. Of late years there has also been an attempt to make a sustained tone by means of a current of air playing directly on the strings, and also by utilizing an electric current for a similar purpose. This last invention is of so recent date that little is as yet known of it.

Any account of the development of the piano would be incomplete if we neglected to mention the influence that was exerted on it by a certain Herr Habenstreit by means of his remarkable dulcimer playing. This man, whose full name was Pantaleon Habenstreit, greatly enlarged and improved the old-fashioned dulcimer and played it in such a way as to excite the wonder and admiration not only of amateurs, but of professional musicians as well. He played before the courts of France, Austria and Prussia with great success, producing effects that are now common enough with the piano, but at that time (1705) were unheard of. There is no doubt that his playing and his remarkable success had a great influence on the clavicin and harpsichord makers of his time and spurred them on to the invention of a keyed instrument that would produce the same or similar effects. His instrument was called after its maker—the Pantaleon—and consisted of two sets of wires, really a double dulcimer, of unusual size and length, and was played with little mallets, covered on one side with hard leather and on the other with a softer kind of leather, by which means the player was enabled to produce either loud or soft tones and tones of various qualities.

There have been quite a number of attempts made to change the arrangement of the piano keyboard, some of which were mentioned in former articles in speaking of piano tuning. The number of keys in the octave seems to be settled now in favor of the seven white and five black, but pianos have been made with the scales running in the opposite direction from ours; that is, by playing to the right a descending scale is produced. Double pianos, too, appear at times but never have had any vogue. In former times it was customary to make the long keys of the piano black and the short raised keys white. This arrangement has, of course, gone out of use, but people have tried to introduce a keyboard with all the C keys blue, all the D keys red, etc., also a keyboard in which six white keys alternate with six black keys.

But the most important of all is the keyboard introduced by Paul von Jankò. His system is too complicated to explain here, but it consists of six tiers of keys—one above the other—the black keys on a level with white, there being alternately three white keys and three black keys. Although there appears to be three tiers of keys, they are so arranged that the corresponding keys in each alternate tier are really the same key, so formed that they can be touched in three different places. By means of this arrangement the span required for an octave is reduced to that required on an ordinary piano for a sixth. Thus, octave playing and all passages requiring leaps or stretches is very greatly simplified, and a person possessed of a small hand with the Jankò keyboard is on an equality with one possessed of a large hand playing on an ordinary keyboard. This arrangement seems to have a good many advantages over the ordinary keyboard, but it has not come into any very general use as yet.

As to the future of the piano, no one can, of course, prophesy with any certainty of not proving a false prophet but, as hinted above, the future piano will, without doubt, be simply a perfected piano of the same nature as our present piano. It cannot be made larger without becoming very unwieldly, but that objection may be met as in the case of the organ by building stationary pianos. This plan would have some advantages, as there would be no limit to the size and weight that might be attained, and the piano would remain in tune much longer than when constantly moved about. In case it were thought best to add to the piano any attachment for making a continuous tone, a stationary piano would have the advantage over a moveable one. If the future piano can be made to give a continuous and at the same time a controllable tone, it will be an ideal instrument, providing, of course, that the characteristic piano effects are not lost. But in the multiplication of mechanical appliances lies a great danger—a danger that organ builders, too, should consider well. When the tone of any instrument is produced wholly by mechanical means the instrument loses to a great extent its appealing quality—the quality that the French express so well by the word "intime." The connection between player and the instrument is not so close and the sympathetic character of the tone is lost. It is this nearness of the instrument to the performer that makes the human voice and the violin the most moving of all instruments. So, if the piano of the future should try to extend its scope, it would undoubtedly lose as much in effectiveness as it would gain in variety. This brings us to the question of mechanical piano players—the Pianola, the Apollo, etc. When these instruments first appeared some pianists seemed to fear that their occupation was gone, but I think there need be no apprehension of any such result. They will take their place in a new field, a field of their own, a perfectly legitimate one, but a field not occupied by the piano. Just as chromos and other pictures, produced by cheap methods, have their place and are of some value in fostering an appreciation of art, but can never take the place of the actual handiwork of the artist, so these self-playing pianos may be useful in their place, may give to music-lovers an idea of a composition that they could not get by their own unaided efforts, but such appliances can never be satisfactorily substituted for a really artistic pianist.

Questions.

1. What material is now commonly used for the heads of the hammers in the piano?
2. Mention some things that would be desirable in an ideal piano.
3. Describe the sostenuto pedal.
4. What were some of the effects produced by the stops, pedals and knee swells on the clavichord and harpsichord.
5. How was the tone produced in the piano-violin?
6. What was the Pantaleon, and why should it be mentioned in connection with the piano?
7. State any point of advantage that the Jankò keyboard has over the usual form.
8. Along what lines must the piano of the future be made?
9. What effect will self-playing attachments probably have on piano playing?

Music is a bridge, over which chastened and purified spirits wander into a brighter world.—*Mueller.*

A GUIDE TO THE STUDY OF MUSICAL LITERATURE.

ARTHUR L. MANCHESTER.

Last month two books were discussed, one of which had for its subject Chopin. While that book practically says the last word about this master's music, viewing its interpretation in the light of the later part of the nineteenth century, there are others which are interesting and useful because they present Chopin to us as he appeared to those who lived in his time. It is extremely helpful, indeed it may be called essential, thus to compare the writings of authorities of widely separated periods of time.

"The Works of Frederic Chopin and their Proper Interpretation," by Jean Kleczynski, translated by Alfred Whittingham, was written about thirty years after the composer's death. The author says that while the number of those who admire him increases, "the circle of those whom he knew and loved, of those who shared his thoughts, diminishes every day. That which tradition brings down to us, concerning his incomparable style of execution becomes more and more vague; no lively remembrance of him remains except with his pupils."

Even at that time, however, there was much to be written about Chopin. The author gathers his information from those who were associated with Chopin and, through friendship and talent, were able to understand him. Believing that, in spite of the many dissertations concerning his works, he was still improperly interpreted, the author sets himself the task of clearing up the difficulties that lie in the way of the correct playing of Chopin, and the volume has as a part of its title "How to Play Chopin." He holds that this difficulty lies not so much in the richness of ideas and attractions they contain, but rather because "the idea is clothed with a tissue so ethereal and delicate, with reflections of that idea so changing and diversified, that we sometimes stop powerless in despair as to the possibility of reproducing such great delicacy."

The book derives value from the fact that it is not a biography. It is not bound to chronological order and deals with the spirit rather than the material. The various compositions are discussed with the personality of Chopin as a background, from which they derive color. The danger of such writing is exaggeration. A too vivid imagination infuses meanings that have no basis in reality, and when it is present in too great a degree, it renders the deductions unreliable. Kleczynski does not commit this error.

As might be expected from his compositions, Chopin considered the first requisite of piano playing to be good touch, his own being exquisite. In his teaching he was insistent that his pupils should have a good hand position and acquire refinement of touch. Considerable space in this volume is devoted to Chopin's method of teaching touch, and consequently there is much of pedagogic value in it. A study of this portion will help to make clear some of the technical difficulties that exist in certain passages of his works.

This work was followed by another entitled "Chopin's Greater Works," translated by Natalie Janotha. This is prefaced by "Notes for a 'Method of Methods,'" which contains some interesting suggestions of a mechanical nature. This second volume is practically an analysis of the Preludes, Ballads, Nocturnes, Polonaises and Mazurkas. These analyses are sane and eminently suggestive. It is in a careful study of such books as these that discrimination is heightened and the understanding quickened. The translations are smooth, and the statements are in direct and forceful language. I would again urge the reader to take note of the language as well as the thought. If, in this respect, he will contrast these books with those of Huneker, he will learn another lesson of value to him.

Another little volume (of only 132 pages), similar in character to the above, is "Beethoven's Sonatas Explained," by Ernst von Elterlein, translated by Emily Hill. This does for these masterpieces what the previously mentioned books did for Chopin. It should be on the piano of every piano student who aspires to play Beethoven. There is nothing of exaggeration about it, but in simple style it presents facts of interest bearing upon the meaning of the various sonatas.

One day at a time! that's all it can be,
No faster than that is the hardest fate,
And days have their limits however we
Begin them too early or stretch them too late.
One day at a time,
It's a wholesome rhyme,
A good one to live by,
A day at a time.

—*H. H.*

VACATION TIME.

In my hammock lying,
In the orchard fair;
Idly dreaming, resting,
Forgetting every care—
Breezes swing me softly,
Gently fan my face;
Branches bend to touch me,
Each motion full of grace.
Nature's music lulls me—
Humming of the bees,
Bird-songs without number,
Rustling of the trees.
White clouds float above me;
Is each a fairy boat,
On some Summer outing,
Taking fairy folk?
Thus idly dreaming, resting,
Pass many happy hours,
Full of sunshine, music,
And the fragrance of the flowers

—*Perna Miner Whitney.*

THE STUDY OF A SONATA.

Beethoven's Op. 2, No. 3, in C.

DR. HENRY G. HANCHETT.

SIXTH ARTICLE—MELODY, IMITATION, AND COUNTERPOINT

The measures of each distinct movement (including the trio as one) are separately numbered. Place a number before each bar, single or double, in order as printed and without regard to the completeness of the measure.

A melody, technically, is a succession of single sounds. Frequently several melodies are simultaneously present in a composition; then we speak of that as "the" melody which is most *melodious*, or in some other way attracts chief attention. For example, a hymn tune is usually sung by four voices, each of which is engaged in singing a succession of single sounds, therefore there are four melodies present. But if one person were to attempt to sing the hymn-tune, no matter what that person's voice or what part he or she would sing if participating in the complete singing of the tune, singing alone he or she would be sure to sing *the* melody, which would be almost certainly the part taken by the soprano in the complete rendition. Yet even in a hymn tune *the* melody is not always the soprano, or even any single voice, at all times. Sullivan's favorite tune to "Onward Christian Soldier," for example, at the beginning has *the* melody in the tenor, a fact which becomes evident at the beginning of the third line, for here *the* melody is in the soprano but is identical with the tenor at the opening. Other things being equal a melody in the soprano attracts most attention, and if a composer desires another voice to sing the melody, it is better to have that voice not only decidedly more melodious, but also stronger and if possible in a different rhythm.

The piano, although in certain aspects to be regarded as a solo instrument, is capable of playing music in several voices and hence of representing the work of a number of soloists. At different times piano music can be conceived in voices as distinct as the soprano, alto, tenor and bass of a hymn tune; at other times while voices are still present, one voice will have sometimes a single tone and sometimes several, thus making it a little difficult to say just how many voices are to be conceived as present, or to just which voice a note belongs. In such a passage as that beginning in measure 39 of the first movement of our sonata it is quite easy to separate the tones into three voices—melody, accompaniment and bass—the melody being always uppermost, the bass occurring on the first beat and occasionally on the third or fourth, and the accompaniment including all the other tones in either hand. In the Adagio from measure 11 the left hand plays both melody and bass, part of the time the two being identical and part of the time the melody being played above the accompaniment, which continues persistently in the right hand. Returning now to the first movement, in measure 47 we find three voices all melodious, although the bass, moving in whole notes, hardly gives an impression of melody, while the other two voices are part of the time of so nearly equal value as to constitute a duet. In measures 52, 53, 59 and 60 there are more than three simultaneous notes, but it is still easy to pick out the single notes that would be the only ones present were the passage to be played, for example, by bassoon, clarinet and oboe. In the Scherzo also, the first eight measures are essentially in three voices, the second eight in two, while the trio is entirely in two voices, in spite of the three chords near its close.

In the study of musical analysis it is of the utmost importance that the student learn to distinguish the principal melody in whatever voice it is to be found, so that it can be recognized upon every reappearance in spite of changed accessories. In order that this may be done, one must be able to separate the voices by ear and give attention to as many of them at once as contain important material. Whenever we can detect two or more simultaneous melodies we have counterpoint; and whenever we can recognize a melodic idea introduced in some new guise, however slight the change from the original model, we have imitation. Usually when imitation is mentioned without qualification melodic imitation is intended, but rhythmic and harmonic imitation are quite as frequent and almost as important. In the Adagio, measure 35 is a rhythmic imitation of measure 34 in the right hand part, although melodically quite different; and in the first movement measures 69-71 present several harmonic imitations called a sequence. But the intention at present is to speak only of melodic imitation.

It is not always easy to say whether a passage is to be regarded as an imitation or a repetition of some model. There must be some difference in order to constitute an imitation, but sometimes a difference is of such a nature as to be only theoretically effective. In the first movement of the sonata, the 17th and 18th measures are plainly repetitions of the 13th and 14th. The 6th measure (from the second beat) although an exact reproduction of the melodies in all voices and the harmonies of the preceding measure, differs in rhythm and is therefore an imitation, not a repetition. But take the passage commencing in measure 162 and ending with the first note of 168. This is reproduced in the key of the dominant commencing with the second beat of 168. This latter passage is a note for note reproduction of measures 27–32; but taken in proper relations it is a reproduction (but for a slight change in 35) of the passage in 33–38, and as such is part of a reproduction extending from 162 to 218 of the passage 27 to 33. But in this last and largest comparison we note only a difference of key, the latter example being universally in the sub-dominant as compared with the former, and the passages are so remote that this key difference does not attract special attention, while the passage beginning in 162 and again in 168 is widely differentiated by the difference in key, the two occurrences of the item being in close juxtaposition. The shorter example last mentioned can therefore be called an imitation, while the larger excerpt, beginning in 27 and 162, may as fairly be regarded as an example of repetition. The slight difference noted in measure 35 as compared with 27 or 170 has a peculiar interest, for this is one of the passages that many editors are disposed to amend so as to make it more strictly imitate its antecedent; it being evident that it is cast in its present form because the scale of Beethoven's keyboard lacked the notes necessary to make the imitation strict. There are very many cases in the Beethoven sonatas where it seems as if the composer felt cramped by the short scale of his instrument, and in some, where no particular design is affected by the change I like to add the notes allowed by a modern pianoforte. In such a case, for example, as the first bass note in measure 26 of the Adagio movement, I do not hesitate to take the low *e* in octaves, the same as with the following notes where the octaves were written by the composer. Beethoven's piano ended at *f*, and he plainly desired the *e*. But in the 35th measure of the first movement he has shown some ingenuity in devising an imitation that will carry out his design in effect, while yet it keeps within the resources of his instrument. I always dislike to change such passages. It seems as if we lost more of the genius of Beethoven than we gain in strict imitation by altering the original notation under such circumstances.

In studying the imitations of the sonata the beautiful canonic passage in the first movement from 46 to 57 must not be overlooked, or that from 114 to 136. These passages give us examples of that use of independent but related melodies in combination which is the best heritage from the contrapuntists. Although historically, counterpoint precedes harmony, in the practical education of the musician harmony naturally comes first, and it follows that the majority of students never reach the subject of counterpoint, and even when they do reach it they are likely to find it mostly a mass of dry bones as presented by the best known writers. But the composers going back humbly to the masters of counterpoint, preeminently to Sebastian Bach, find methods, inventions and suggestions that enable them to greatly heighten the beauty of their works. The work before us would hardly pass for a distinctively contrapuntal composition, yet it is full of brief examples of a free and thoroughly artistic use of contrapuntal devices. Look, for example, almost at the beginning, measures 9–12, or 47 to 60, or 148–155, or at nearly the whole of the Scherzo, or in the last movement at measures 56 to 70, or 78 to 97, or even to 168. These things show a grasp of musical resources and a many sided view of the subject in hand that delight the musician and bewilder the untrained ear, and while there is none of that dreary puzzle-solving that was the death of the contrapuntal school as such, there is an intertwining of melodious material that gives the curve of beauty to the work from whatever side it is inspected. As rhythm is the life and harmony the soul of music, so is melody its grace and charm, its outline of beauty and its most salient attraction. He who would know the structure of the art must let its melodiousness sink into his heart and memory and learn to find the germ and mainspring of the composer's inspiration, however involved or concealed. In another paper we will consider how the germ is developed into the completed work.

If in the breast tumultuous joys arise
Music her soft assuasive voice supplies.

—*Pope.*

MUSIC FOR THE PEOPLE.

The following clipping from the New York *Evening Post* would seem to indicate that progress is being made in developing the musical taste of the people. If opera were placed within the reach of the masses by lowering the prices, there would be less deficit at the close of the season.

There seems to be a general movement in European countries to provide the people with good music at low rates of admission to concert halls and opera houses. More and more attention is being paid in Germany to the educational influence of music upon young minds. During the past winter special concerts for school children were given in Hamburg, with an average attendance of 2270 pupils. The admission price was only 10 pfennigs (about 2½ cents), a local musical society making up the deficit. In Breslau the city council voted $5000 to the orchesterverein that four extra concerts should be given for school children. The conductor was Moszkowski. In Vienna it was then decided to establish a Volksoper in a building to be erected. At this, light operas (but not operettas), which cannot be sung effectively in the vast auditorium of the imperial opera, are to be performed, and some of the singers and players are to be advanced pupils of the conservatory, who will thus gain experience, while making it possible to charge popular prices for tickets.

In this country attempts have been made in several cities, with varying degrees of success, to provide concerts and opera for the people at rates within their reach. A Chicago periodical speaks of "the enthusiasm of music students over the Thomas concerts since twenty-five-cent seats have made them a possibility for all." While he was in New York, Mr. Thomas gave concerts for young people at one time, and during the last two seasons Frank Damrosch has done likewise. Useful work has been done by the People's choral union and other associations, while the city last summer spent $48,480 for free band concerts in Greater New York—nearly as much as was voted by the city council of London, where about $50,000 was spent on bands last season, as against only $15,000 in 1892—eloquent proof of the growth of the movement.

One of the most interesting experiments made here has just been brought to a close at Cooper Union hall. Franz X. Arens (who, some years ago, gave a series of orchestral concerts in Europe, to acquaint Germans and others with the best American music) undertook, with an orchestra of forty, to give a series of five concerts at prices ranging from fifty cents to only ten cents per ticket. He began with the earlier masters, and gradually reached the modern romantic school. The performances improved steadily, and so did the attendance. For the last two concerts nearly all the seats were sold, while the quality and quantity of applause indicated real intelligence and appreciation on the part of the listeners. Mr. Arens has already announced a second series for next season.

The ideal without the real lacks life; but the real without the ideal lacks pure beauty.—*Victor Cousin.*

FOR THE YOUNG PEOPLE.

The Young Musicians' Perseverance Club.

Conducted by ARTHUR L. MANCHESTER.

At the time this is written, vacation fun is at its height. A good part of the country has been suffering from extreme heat, and I suspect that members of the Young Musicians' Perseverance Club are principally engaged in trying to keep cool. To do that has been as hard, for the last week, as to learn a Heller Etude. The time is hurrying on toward Fall, when we will find ourselves in the midst of study and other duties, so it will be well for us to get our bodies and minds both ready for the activities of that time.

Our Missionary story ends this month, and it has some questions to be answered. A good many who answered the June questions did not have their names printed in July, because the editor was compelled to have the Club matter ready sooner than usual. They follow here:

Ada R. Marsh.
Emma Olmstead.
Susie L. Schulze.
Floreuce A. Cross.
Lauretta Hedberg.
Effie A. Frisbee.
M. Agnes Roberts.
Helen Weber.
Ethel C. Porter.
Annie E. Hedberg.
Florence Long.
Jeannie C. Davis.
La Belle Mahon.

There having been no questions to the July story, we will gather around the Club table for a chat. Our members can imagine they are indulging in cooling drinks while they talk.

Here is a new member from the North. All the information she needs this member can secure from the page. She is welcome and there are no conditions, except to take part with us and to try to do her study as well as she possibly can.

MINNEAPOLIS, MINN.

Mr. Manchester, Dear Sir—I enclose answers to the June questions on a separate sheet of paper. I hope they are all correct. I should like to become a member of the "Perseverance Club," and so would thank you very much for any information you would kindly send me concerning the Club.

Yours respectfully, EFFIE A. FRISBEE.

We are glad to get the program. It shows careful work and must have been interesting. This member is ready to give suggestions. We hope other members will tell how they accomplished their work.

HOOSICK FALLS, N. Y.

Dear Sir—Enclosed are answers to the questions in June number of THE MUSICIAN, and also a program of my teacher's last pupils' musicale. I thought perhaps you would be interested to know what we are doing in our tiny corner of the musical world. We may not, as yet, have achieved any very astonishing results, but we are doing the best we can under the direction of a very good teacher, who, as perhaps I have told you before, is a Mason pupil. During the past Winter, I have been spending as much time as my school studies would allow in improving my technique, so I have not added many new things to my repertoire. Just at present there are very few things which I can play well, for it is almost impossible for a student at school to spend a great deal of time on technical studies and still keep in practice all the old pieces. But this Summer I shall probably work less on finger exercises and will have time to work up my old pieces, with occasionally something new. Then after a rest, I shall be ready for more hard work next Winter. In the last number of THE MUSICIAN, Anna May Bartlett wished to know the best way to memorize. The way I always memorize is to divide the piece into parts of two or three measures each, and learn each group of measures thoroughly before I venture to look ahead at the next group. A certain number of these groups is learned each day and the piece is memorized quite rapidly as well as thoroughly. I have memorized everything I play in this way, and although it takes longer to learn some pieces than others, I have never found anything yet that would not come after a time with perseverance. With best wishes for the Club, I remain,

Sincerely yours, FLORENCE A. CROSS.

Photographs should be sent to the editor care of the Hatch Music Company. Those of our members who study Latin will find it a help in their music.

POMONA, FLA.

Dear Mr. Editor—I have been late for the last two months, but I hope this will not be for I always like to be on time. This month's questions are easy to find. I go right to my musical dictionary and get my definitions from there. I study Latin in school and I find it helps me a good deal with my music sometimes. One of the pieces I am practicing this week is "Caprice Bohemien," by O. Leblerre, Opus 20, also "Les Preludes," a duet by Franz Liszt. I like the duet very much. If I only had some one to practice it with me at home, it would be much pleasanter. My teacher plays it with me. Yours truly,

EMMA OLMSTEAD.

Here we have a new member from way down in Texas. The Club touches every part of the country. This member surely has been a worker. She has memorized a good list of pieces, and must be pleased with her medal.

CRESSON, TEXAS

Dear Mr. Manchester—May I join your Young Musicians' Perseverance Club. I am twelve years old the sixteenth of last May, and I have taken music lessons nine months. I am going to be a music teacher. I have taken all in W. S. B. Mathews First Grade Standard Course, then Czerny Etudes de la Velocite, Op. 299, Book I, Part 2. Rocky Glen Two-Step, by R. Streabbog; Melody, R. Schumann, Op. 68; The Merry Farmer, R. Schumann; Little Study, R. Schumann; First Loss, R. Schumann; The Wind-Up Galop, H. Engelmann, Op. 422 No. 6; Tread Softly, the Angels are Calling, J. W. Turner; The Hunter's Call, F. Boscovitz; Cornflower Waltzes, Chas. Coote, Jr.; Forest Flowers, J. Harry Gould; Evergreen Waltz, J. T. Stoddard; Gertrude's Dream Waltz, Beethoven; Bell Chorus (four hands), W. A. Mozart; Joys of Spring (four hands), Carl Sidus, Op. 71; besides studies in Richardson's Instruction. And since my teacher has gone, I have commenced to memorize Die Muhle, by Adolf Jensen. My teacher told me to learn this and then take up Clementi's Sonatinas. I won a medal on making the most progress during the nine months. I have memorized all of my pieces. I will try to answer each month's questions.

Yours truly,

M. AGNES ROBERTS.

It is a good resolution to continue to do some work during vacation. This is one of our faithful members.

WARWICK, MARYLAND.

Dear Sir—Vacation has at last arrived and although I intend to enjoy myself yet, I certainly shall not neglect to answer the questions as usual. In fact, I enjoy the letters, questions, etc., too much to do so. At our commencement on the nineteenth of June, I played "Au Roulet," by Benjamin Godard. This is the last piece I received from my teacher and I like it very much. Mary's examination paper was interesting, and I would dearly love to hear her play, as I am sure she has profited by her grand work of the past year. I know Sister M. Clare is very proud of her pupil. I missed Ida's name from the list, but hope to see it soon reappear. It would just be grand if Anna May Bartlett could win that medal. Just think, one of our own Club members victorious over many contestants. I do believe I would feel almost as proud as she. With love to all my Club members and kindest regards to you, I remain,

Yours sincerely, ADA R. MARSH.

TWO MUSICAL MISSIONARIES.

The partition on all sides of the circular stage had been removed, and so all the people in the amphitheatre could look into the underground world represented in the third scene. Orpheus in his shepherd's cloak, and with the bay-wreath about his hair, was walking here, between flames springing from rocks and yawning chasms. He was playing most beautiful music upon his lyre, and the fierce, three-headed Cerberus had ceased his barking and followed on, subdued by the music. The imps and phantoms were quiet, appearing and disappearing among the chasms. Suddenly, as by magic, the scene is changed by the helots, or scene-shifters. A beautiful light replaces the gloom and terror; the rocks and flames, and the phantoms vanish. Orpheus has passed through Hades and enters Elysium. Glorious beings lead him to Eurydice, beautiful as the seraphs about her, and she stands awaiting him, as he rapturously plays the wedding music of the first act. Then they seem to rise together, ascending through the rose colored haze toward the world above.

Romanus and Petrus, fearful of delaying too long on their journey, left the pavilion, not waiting for the closing scenes that followed, and took their way toward the city gates. Soon they were again upon the road, talking eagerly together of all the events of their brief stay in the city. Their hearts glowed with thankfulness that they had been the means of bringing about a change in what they considered the sacrilegious and corrupt musical service of the great temple; for they knew its influence and that of the cardinal in that part of the country, and felt certain of the reform being followed by all the lesser Churches in that region.

"Indeed," Romanus was saying, "one cannot tell how far-spreading, how mighty, may be the results!"

"What a work awaits us!" said Petrus. "We are absolutely fearless; none dare molest us, because of our religious dress, and our voices serve us well in portraying the beauty of these divine chants. Surely God hath ordained us to this blessed work of spreading the gospel of pure music, of bringing the people to knowledge of its beauties and Divine origin."

"Some there be," said Romanus, after a pause in which both the monks meditated joyously upon their mission, "some, who in ignorance believe music a gift to mortals from the gods, whom they imagine inhabit Olympus, a mountain north of Greece; and not only music as a cadence, having its first whisperings, perhaps, in the breezes in the Garden of Eden, or probably in the surge of waters, and the song of birds at the earth's creation, but through all the centuries that have since passed, bringing the invention of instruments, and the writing of signs to indicate the rise and fall of sounds—all these they attribute, in their heathen ignorance to their false gods. Strange! Strange!"

More of a philosopher than the practical Romanus, Petrus answered, quickly:

"Blame them not. In all souls there exists the reaching out toward a Higher Power as the Source of all things. To imagine deities upon Olympus were surely better than the still more ancient worship of senseless images of gold, or idols of stone. Let us thank God that we know Him as the true Source of all things," the monk added, fervently.

The road had ended now in a wide plain that seemed bounded only by the sky and clouds, which stretched down to meet it, far away. As they journeyed on, the cold winds blew across it from the north, the sky became overcast with leaden, gray clouds, and they hastened their steps, for the night would be soon upon them.

To beguile the way, Romanus related an Egyptian myth of the winds and the plains, which had been told him by an old monk at the St. Gregory Convent:

The Egyptians believed in the existence of the gods, also, and had named Hermes god of the winds. Maia, goddess of the plains, was his mother, and once when walking with him in a great desert, he ran from her toward a tortoise shell lying on the ground, and was soon busy boring holes in its sides, and stretching strings across it; then, when all was done, he held in his hands the first musical instrument the world had ever known. Hermes named it a lyre, and sweeping his hands over the strings, brought forth sweetest of harmonies. So the Egyptians called Hermes god of the winds, "the inventor of music."

"But, in truth," said Romanus, "his music is but the melodies which we may constantly hear all about us in Nature, and which can awaken feelings of joy and sorrow, of regret and yearning, of fear and hope, of vehement gladness and utter despair."

For many hours the monks traveled onward and for a time cheered one another by pleasant converse, or often singing together the sweetly beautiful chants of St. Gregory, but at last they fell into silence. The night was upon them, and they seemed far away from any habitation. And now the air had become filled with snowflakes, the mighty Hermes was abroad in his loudest and most sweeping mood, shrieking his scales through all keys, and from octave to octave, retarding the footsteps of the travelers and forcing them far from their way. They struggled on and on in the darkness, bravely, and with oft muttered prayers, until at last, descending a little slope, they fancied themselves on the borders of a vast lake. And it was, indeed, the Lake of Constance, to which they had come. Upon its banks Romanus sank in the thickly-falling snow, but begging Petrus to continue on, if he were able. So half dazed, Petrus went on, and it is said that an angel came to him, strengthening him for the remainder of his journey across the plain, and so finally bringing him safely to Metz at the end of many days. With Romanus, left in the snow, still greater was the miracle. Lifted in strong arms, he was borne to the very gate of the monastery of St. Gall, hard by the Lake of Constance, where he was given strength to knock loudly and demand admission, and in an old book of legends we may read that "the monks, having taken him in and tended him till he was restored to health, persuaded him that he should remain with them, and teach them the Gregorian song out of the antiphonary which he had brought with him, and this he consented to do in gratitude of heart to them. Romanus lived to be an old man, and such was the fame of his teachings, that scholars came from all parts to St. Gall, in order to learn the Gregorian music."

QUESTIONS.

1. In the story of last month, what is the meaning of Benedictine?
2. Of *fanfare?*
3. What is a lyre?
4. Who was Orpheus?
5. Who was Eurydice?
6. What great composer wrote an opera founded on this Grecian myth?
7. What is a myth?
8. What is the meaning of Hades?
9. Of Elysium?
10. What was Cerberus?

Dedicated to Mary Clement Metcalf.

WOMAN'S PAGE

Conducted by Miss S. C. VERY.

CLUB NAMES.

Distinct in nomenclature are the musical organizations of men and women. The former have their Philharmonic societies in New York and Vienna, in Berlin and London; their Symphony societies abound, only named differently here and there, as in France, where they have become identified with its famous Conservatoire, or the name of Colonne.

In America, Land of Women's Clubs, from that territory of which the mining camp is the nucleus, to the great Metropolis, the variety in Club names, attests feminine zeal in music and wish for more personal associations. In the South, a Euterpe, in the West, a Clara Schumann, in New York State, a Chaminade Club proclaim fealty to some presiding womanly presence. A Saint Ambrose in Connecticut brings very primitive claims "up-to-date." Santa Cecilia, of blessed memory, is enshrined in every corner of the land, a rival, perhaps, only of the "Lares and Penates"—so to speak—the name of the locality in which the Club was first organized as Hartford Music Club, Martinsburg Music Club, etc. Some names very practically declare the Club's *raison d'etre* as The Piano Club, The Vocal Club, Music Students' Club, while in Kentucky, a Philharmonic and, in Iowa, a Symphony, show aspirations there of Lovers of Harmony toward that attainment, those names ever suggest in music's world. The Key Note of Illinois rings forth its purpose clearly, and who can fathom the mysticism possibly implied beneath the title Wednesday Club, Thursday Club? For philology informs us that they perpetuate remembrance of worship ascribed to old Wotan and Thor. Rossini may boast of devotion most lasting, belonging, as does his name, to the oldest Club, that of Maine. Brahms and Wagner hyphenated is the sign manual of the Club of most modern aims, in Washington, D. C. The youngest yet, a Club born in 1901, with an independence that is refreshing, asserts a title hardly yet used, *i. e.*, The Musical Circle. "The Musicale," seems least happy a name, for it is ever a foreign guest in English-speaking circles. Fortnightly, savors of literature, not apparently connected to a "concourse of sweet sounds." The modest title of The Music Section usually stands for one of the strongest forces, ally as it is of Clubs with other aims, its succor asked and readily given, making activity constant, results in a healthful vitality.

The great English dramatist is anthority for the statement that in mere name is a vacuum. Moreover, in our special corner of Clubdom's field, the designation Musical, ensures future happiness enough to counteract any evil results from other powers attendant upon the christening of a newly organized Club.

THE CLUB OF ONE.

"You will be sorry to learn that in my absence on a little trip, the Club went to pieces." Thus despondently writes a Club president.

"I resigned, because the whole burden of the Club was placed upon my shoulders—it proved too heavy." This from another president.

The enthusiasm of some One—how frequently it organizes a Club; she pilots its incipient career, suggests plans; she it is, not the secretary, who writes for advice, appeals for help, and if organization be submerged is last to go down with the wreck.

At the commencement of the Club year, why not impress upon the Club the duties of a secretary (a position so often a sinecure), and read them aloud from the constitution? Why not rouse in committees a keener sense of responsibility? In union there is that strength which the Club of one may never hope to gain. Zeal is contagious, and once awakened, like the letter-chain, augments possibilities for advance marvelously. Has your printing-committee experienced the gallantry of the local printer? "For printing received," his notices of Club work are ever encouraging, and in towns where there are two printing offices, emulation in flattering attention to the Woman's Club is marked. Why not add to that constitutional cluse "For self improvement" another, "and others benefit?" Extend the tenuous boundary-line, fast narrowing to the Club of one, beyond music's field, into other Clubs; into hospitals; to the poor; to the afflicted? Thus, far-reaching possibilities for good will be illimitable and the Club of one, amalgamated into the Club of many, will surely become that new force of a nineteenth century identified with all power for good—a prosperous Woman's Music Club.

THE CLUB AN APOLOGIA.

An old friend, a teacher of art, called yesterday; wearily throwing her arms upon the table she laid her head upon them, exclaiming: "I am so tired of apologizing for the old masters!" She touched a sympathetic chord in the heart of many a music teacher as well as of Club women, who, when they banish the trivial from their hamlet or town, in desiring the good, are obliged to apologize, to appease, to conciliate, to confess that the great masters do not bring to the populace the glib message of the musical charlatan. Fortunately they substitute for the latter's tune, jingle and monotone, their melody, rhythm and harmony.

In early days of its history, therefore, the Club's attitude is defensive and its programs are given under protest. Within its walls the names Bach, Beethoven and Mozart are cherished personalities; outside, if known at all, they are mere epoch-making terms. However, the devotion of the populace vacillates constantly, proving the music it craves ephemeral, while that of sound musicians is for all time.

Abroad where the greatest lived, they are more widely known and better loved by the people. Regarding art, De Amicis writes: "On Sunday you should see little children, young people, women of the people before these art creations; see how their countenances lighten, hear the sweet words from their lips. Murillo to them is a saint; they smile as they mention his name as if to say, 'He belongs to us'—He is more than a sovereign master of the beautiful, he is a benefactor, an inspirer of good deeds—one of those men whom instinct tells us we shall see again, who has not gone forever, whose life is an inextinguishable light. Before one of his pictures, a hope entered my life of being nobler, more useful—I never had such perfect faith as at that moment." In music as one sees constantly abroad, mechanics, shopkeepers, little children listening to the familiar music of Wagner, Beethoven, etc., or in the gardens where whole families assemble, sees some worthy Frau knitting an accompaniment to works called classic in phraseology of the student, then she says. "So is music's message realized, its great ones appreciated." When they become household friends, apologies cease to be heard.

CLUB WORK.

THE MUSICAL CIRCLE OF VINTON, IOWA.

Here appears, we believe, the youngest Club of all. Its future anniversaries will date from 1901. A year book of white and gold adornment contains a program comprehensive enough to include the most up-to-date studies of music by women and by American composers, with that also of the works by J. S. Bach and Beethoven. At the commencement of its calendar is the inscription:

"Music is the key to the heart
Progress, a duty of life."

The usual corps of officers with a Program Committee and one of Printing systematize duties, and to each one of its nineteen members assign duty throughout the year, thus ensuring general interest. It elects as studies, the following subjects: Music as an Art; Early Music History; Primitive Musical Instruments; Early Forms in Music. From such a starting point, it proceeds to Bach and the fugue; Haendel, Beethoven, Mozart and Gluck, alternating with modern works by De Koven, Nevin and Margaret Lang, while The Romantic writers also receive consideration. The illustrations are by piano, violin and song. These youthful enthusiasts have selected a Club color, the combination green and white, and quotations from Ruskin, Bulwer and Shakespeare in praise of the art to the study of which many of their coming years are to be dedicated, are interspersed among the portions of their musical program.

Many will watch with interest this Circle—we trust an ever widening one—and, if unbroken with coming years, it will bring joy to its members and benefit to its community.

CORRESPONDENTS' COLUMN.

"We desire hints for beginning Club study:" General music history as a study is the avenue of approach to the broadest outlook for Clubs. Two concise text-books are: The Story of Music, by Henderson; Bonavia Hunt's History of Music.

"How shall the year's program be arranged?" Insist on making the work general by assigning a duty to each individual; vary essays with music; endeavor to have the course of study systematic in development from October to June.

"Kindly outline a year book." Experience is the best teacher; we forward year books of other Clubs.

"Please recommend books on the subject of opera:" The essays in Grove's Dictionary, by Rockstro and Jenks; The Music Dramas of Richard Wagner, by Albert Lavignac, students find indispensable (this is translated by Esther Singleton); Esther Singleton's Guide to the Opera and Mabel Wagnall's Stars of the Opera are reliable; The Opera Past and Present, by William F. Apthorp, is the latest, and welcomed by all familiar with his writings.

"Please give assistance in finding data about modern composers of to-day:" See files of THE MUSICIAN, 1899–1900, from December to July, inclusive, The Woman's Page.

NEW PATHS.

Iowa:—The Musical Circle of Vinton, Iowa, announces its entrance inte Club life with a year book tastefully adorned in white and gold. A program of study carefully planned and comprehensive, proclaims earnest aims.

Massachusetts:—The Music Section of the Woman's Club at Amherst, is to devote time during the seasons 1901–1902, to the subject of Musical Instruments.

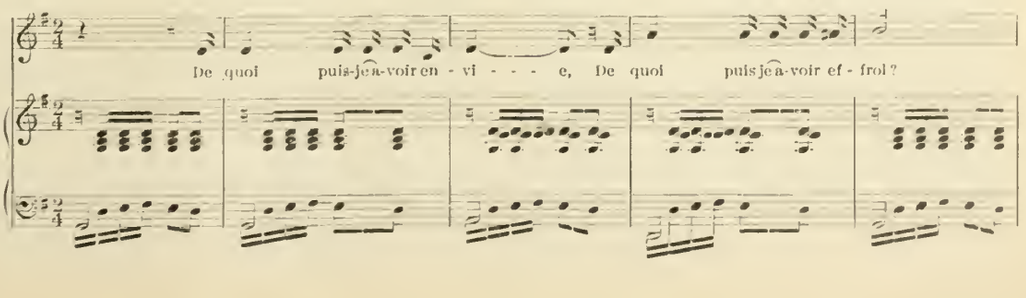
Connecticut:—The Piano Club, whose members by earnest study of eight hand arrangements, are familiar with the trios and quartets of the greatest composers, contemplate a series of concerts by leading organizations to be given under their auspices.

New Jersey:—The Cæcilian Club of Freehold, plans to visit, as a body, the Crosby-Brown Collection of Instruments at the Metropolitan Museum of Fine Arts, New York City.

Let us accept music as a gift, a most precious gift of God. Let us study it with reverence. Let us practice it with humility and diligence, so that we may catch and drink in the spirit of love which it breathes, which is of God and which leads back to God. Finally, let us stand, and with uncovered heads and uplifted hands, say, "I thank thee, Oh God, for the gift of song."—*From Northwest Journal of Education.*

SANS TOI.

GUY D'HARDELOT.



THE SONATA-SYMPHONY FORM.

A Lecture delivered before the Metropolitan College of Music.

CHARLES S. SKILTON.

(*Continued from July.*)

Let us select the greatest of all symphonies, Beethoven's Ninth. This work is an outcome of the ideas developed in the French Revolution, expressed by Schiller in the "Ode to Joy." The subject is the coming of joy into human life. The first movement is a picture of life without joy. Few things sadder and more hopeless have ever been written, but through it all we feel that we are hearing the suffering of a great spirit, an heroic, manly soul that will strive to the uttermost and never utterly despair, even when all hope is lost. The second movement is a scherzo. In a bitter, terrible way it is playful; playful as a man who laughs in the bitterness of despair, who laughs that he may not weep, though weeping might be his salvation. In all instrumental music there is only one thing sadder than the bitter mirth of this scherzo, and that is the third movement, the *adagio*. In a major key, restful, religious, beautiful—in what does its intense sadness exhibit itself? In its retrospective character. Said Dante, "There is no greater sorrow than to remember happy times in the midst of misery." Said Tennyson, commenting on this passage with happy paraphrase:

"This is truth the poet sings
That sorrow's crown of sorrow is remembering happier things."

So this beautiful adagio, calling to mind a former happier state after the hopelessness and despair of the preceding movements, realizes the song of the poet and reaches the lowest depth of human misery. It is followed by a discordant outcry of all the instruments and a passionate questioning in furious recitative of the basses. A mighty voice seems struggling for speech, a tormented spirit seeking relief. In quick succession are heard the themes of the first three movements—hopelessness, bitter despair, memory of lost joys—are these all existence has to offer? Again the discordant outcry, renouncing all existing conditions, again the passionate question. And at last the answer is heard, a few measures of the "Ode to Joy." The orchestra seems to listen as the shepherds at Bethlehem listened to the angel's message. Softly it is taken up and spread from part to part, a veritable gospel; voices join the instruments, the sorrow and torment are all forgotten and everything united in the joyous hymn which carries all before it to end in a tumult of unbounded happiness.

Having thus surveyed the general plan of a sonata, let us examine its architectural structure more in detail. The first movement usually exhibits the most highly developed form. Like organic life the sonata grows from germs. These are generally three in number and may be called the *main theme*, *secondary theme* and *closing theme*. They are joined with one another by more or less extended passages with which they are so closely connected that it is often difficult to define their exact limits. The whole movement is divided into three groups. The first is devoted to stating the material, the second to developing it, the third to its recapitulation In the first group there is danger that the mere statement of the material may be taken for the entire movement. To avoid this the secondary and closing themes are placed in a different key from the main theme, so that the impression of a close which is made at the end of the first group is not final, but only indicates that the material has been fully presented. This first group is usually repeated, partly to impress the material more deeply upon the hearer's mind, partly to preserve a proper balance of parts. In these days it is becoming fashionable to omit this repeat. Beethoven in two of his thirty-two sonatas has done this, inspiring one editor to cavil at the repeats in the remaining works, many of them written *after* those two. The editor calls them a "meaningless tautology," and intimates that they are a servile concession to tradition, a weakness to be lamented in a musician otherwise so great. The same thing applies to all other sonatas, *e. g.*, those of Schumann and Chopin, both of whom used the repeat. Each of these was a man of the highest genius, each possessed the keenest sense of form and proportion, two at least were pathbreakers in new fields, and none of the three hesitated to break with tradition when anything was to be gained. Each believed that the repeat was essential to the architectural structure of the sonata. Is it not strange that they were wrong and our *fin de siècle* critics right! Perhaps, after all, the fault is with our age of hurry and unrest, and our preference for little things. Perhaps we have lost sight of the principle of repose and do not entirely appreciate the massive proportions of the larger forms of art. The second group of a first movement is devoted to the development of the material stated in the first group. Here the composer gives free play to his imagination, modulates into remote keys, makes new and unexpected combinations and forms a climax.

In early sonatas this group was of minor importance; in later ones it is the essential feature. The third group repeats the material stated in the first, but keeps all three themes in the principal key, making the close final and satisfactory. To make the ending still more perfect a short *coda* is often added, developed from the main theme, and sometimes so extended as to form a fourth group. This is the form in which overtures for orchestra are usually written. One who understands it will have little difficulty in comprehending any of the other forms used in music, except perhaps the fugue. For the sake of completeness the others will be mentioned and briefly explained. The *song* form is a simple group of periods, illustrated by all familiar hymns. Its first part usually ends with a half close on the chord of the fifth degree, in contrast to the full close of the last part. The *theme* and *variations* is another variety of this form, the theme being a song and each variation having the same fundamental structure, though a more extended coda is often added. The *minuet* form is composed of two song forms put together, the first being repeated after the second, making a threefold structure. The second was originally written in three part harmony and hence called a trio. The minuet form, more or less modified, is that in which most of our popular short piano pieces are written. It is one of these forms which composers usually choose for slow movements of sonatas, though occasionally we find a sonata form without a development group or a rondo, the form which remains to be considered. The scherzo or minuet of a sonata is always written in minuet form. Schumann and later composers have made the form fivefold instead of threefold by adding a second trio and then repeating the first part again. The rondo form allows of much external brilliancy and is easily understood, characteristics which render it peculiarly suitable for the closing movement. It consists of a leading idea recurring three or four times, with episodes between in different keys and styles. Sometimes the rondo and sonata forms are combined by repeating the earlier episodes near the end in the principal key. The rondo, too, usually ends with a coda.

(Explain Mozart's C minor sonata, compare with Beethoven and have it performed with second piano by Grieg).

The intelligent listener can hardly fail to be impressed with the threefold structure of music and to wonder why we should take pleasure in hearing again near the end what came at the beginning. The threefold form is the expression of an underlying principle that has manifested itself in all ages and been interpreted in various ways. Six centuries ago, men said that triple time in music was the only perfect time, because it was suggestive of the Holy Trinity. Dante in his *Vita Nuova* or *New Life*, gives an interesting application of this idea. The *Vita Nuova* is the story of the great poet's early attachment for Beatrice. Speaking of the frequent occurrence of the number nine during this experience he explains it as follows: "The number three is the root of nine, because without another number, multiplied by itself alone it makes nine, since we readily see that three times three are nine. Then if three is in itself the factor of nine, and if the factor (or maker) of miracles is three, that is, the Father, Son and the Holy Spirit, which are three and one, then the fact that this lady (Beatrice) was accompanied by the number nine means that she was a nine, that is a miracle, whose root is only the Holy Trinity. Perhaps some more subtle person may see a more subtle reason for this, but this is the reason which I see and which pleases me best." Dante need have felt no concern; his reason has endured for six hundred years as an unapproachable model of subtlety. What is the principle underlying threefold structure, that which Dante saw as through a glass darkly? Do we see more clearly in modern times? The threefold structure of modern music as exhibited in the sonata form, is typical of the natural law of development, of growth, maturity and decline. One who has watched the rising sun "gilding pale streams with heavenly alchemy," who has felt its noonday heat and seen its life-giving power, and who has witnessed the mellow radiance of its setting, reproducing the gorgeous morning tints with some slight, indefinable change; an observer of such phenomena can understand the beauty of the threefold sonata form with its statement of material, development and recapitulation. Or again, if we consider the life of man, we see that the same form is typical of childhood, manhood and old age; the statement of material typifying the amassing of facts and experience to which childhood is devoted, the development typifying the period of storm and stress and adjustment in which early manhood is passed, while the recapitulation, presenting the material once more and finding new meanings in it after the development through which it has passed, is suggestive of old age to which experience has given fixed assurance of life truths that in childhood were believed without question. And higher still the student of history may trace the threefold form in the growth, maturity and decline of nations, while the geologist assures us that the earth itself has passed through such a stage of formation, is now in its maturity, and has the prospect of a dissolution in which there shall be a return to earlier conditions. The keenest vision of poets, the most daring speculation of philosophers, conceive of such threefold rhythmic changes progressing through the universe from one planet to another. In short sonata form is the artistic type of the law of evolution. And thus we see the infinite variety of feelings which can be expressed in this form. Does a composer wish to suggest such human relations as friendship or love? What more appropriate than a sonata for violin and piano with its two contrasted personalities? Is one filled with the joy of communion with nature? Let him hear Beethoven's Pastoral Symphony or Schumann's in B♭, often called "Spring's Awakening." Is he thrilled with the grandeur of conflicts of nations and upheavals of society? There is Beethoven's Heroic Symphony inspired by the career of Napoleon, and, as some say, of Washington. Or does one entertain loftier ideas—of fate and tragedy—of human nature struggling from darkness to light? They are expressed in the Sinfonie Pathetique of Tschaikowski or the Fifth of Beethoven. National characteristics are embodied in the Scotch or Italian symphonies of Mendelssohn and Dvorak's "New World," and it is well known that Beethoven contemplated a tenth symphony, of which he said, "I will reconcile the ancient and modern worlds."

Such examples of the employment of the sonata form render it difficult to conceive of a style of instrumental music better suited to the expression of broad and lofty ideas. Still we are continually being told that the sonata is passing away and yielding its place to the shorter forms now in use for our popular concert pieces. Some one has remarked that this is an age of little things. We prefer the microscope to the telescope, the short story to Shakespeare, the epigram to the oration, the romance to the sonata. It is probably true that in piano and vocal music the smaller forms are predominant. In other fields their claim may be challenged. Of violin music we find no modern compositions more familiar than the concerts of Bruch or the sonatas of Grieg. No recent organ music surpasses the sonatas of Guilmant and the symphonies of Widor. For the trio or stringed quartet, other forms than the sonata are hardly ever employed, while for orchestra not even the symphonic poem has been able to displace the symphonies of Brahms, Tschaikowski and Dvorak, or to prevent other composers from frequently producing them.

A prominent singer has recently complained of American composers for their devotion to small forms of composition and their neglect of larger works. But what piano music in this country has commanded more respect than the sonatas of MacDowell? What violin music has received more favorable comment than Bartlett's concerto? What orchestral music has awakened more interest than the symphonies of Chadwick and Shelley? With these examples in mind chosen from our own times, I do not hesitate to express my belief that, whatever the temporary fashion of one day and generation, the sonata is as enduring as the natural laws it typifies, and will be written so long as men feel impelled to express in music what is deepest and noblest in human life.

A bit of work of the highest quality is a key to a man's life because it is the product of that life, and it brings to light what is hidden in the man as truly as the flower lays bare to the sun what was folded in the seed. What a man does is, therefore, an authentic revelation of what he is, and by their works men are fairly and rightly judged.

VIOLIN STUDY—FOUR FACTORS IN THE ART OF STUDY.

GEORGE LEHMANN.

If the average human being of to-day has reason to be thankful for having been born in an age of enlightenment and civilization, musicians, and more especially violinists, of the present century may consider themselves extremely fortunate that they were not born amidst the social conditions which prevailed in our great-grandfathers' days. Violin-playing, in those days, was hardly a much admired accomplishment in most communities; and in England as well as in America, "fiddler" was a term employed by many to express deep pity and contempt. Indeed, something of this sentiment still attaches to the term among affluent though uncultured people; but only a vestige of it yet remains to shame our civilization. To-day, violin-playing is universally enjoyed, and no longer occupies a doubtful position among the arts. But the average lover of violin-playing little appreciates what it means to become proficient in this art. He has a hazy sort of an idea that the training of the arm and the fingers requires a player's attention for several years, but that, after all, the violinist's art is a gift from heaven which may be exercised without great toil. Nor does the violin student himself always appreciate the requirements of his art. He, too, is apt to believe that Nature's generosity is all-sufficient. From year to year he gives the crudest expression to his emotions, little suspecting that his greatest need is knowledge of the art of study. When he listens to the exquisite musical utterance of a truly great artist, he sighs that Nature has not blessed him, too, with such a wonderful gift. He does not realize how earthly is the process by which such things are attained.

The art of study is hardly to be reckoned with in the student's earliest experiments. It is an art whose subtleties cannot be appreciated by the young and undeveloped mind. In the beginning, violin-playing is at best erratic experiment—a series of attempts to achieve by means of purely mechanical effort. Imitation, and a fair degree of technical precision, are the most that may be hoped for; and it is only with the ripening of intelligence that the player's individuality asserts itself. But when this day arrives (and in music it frequently comes at an early age), the player has much to accept from others, much to reject. In his striving for originality, he must not imagine that his purpose is best accomplished by giving a loose rein to all his peculiar musical emotions. Observation, Analysis, Comparison and Selection are the chief factors in the struggle to develop originality.

At the Hochschule, in Berlin, the art of study means neither more nor less than a slavish attempt to imitate Joachim in every detail of his work. The result is deplorable. Every year the Hochschule sends out into the musical world its feeble imitators of a great violinist—imitators who have failed to catch the fine spirit of their master, whose best work is characterized by distortions and exaggerations. The original beauty of Joachim's playing they do not reproduce for us; nor do they reveal what has been slumbering in their own minds and breasts throughout all the years of their musical apprenticeship. Dogged imitation, unassisted and unrelieved by the higher motives which alone make imitation useful and desirable, is but the dead and fruitless branch of a burgeoning tree.

Observation may correctly be considered as standing first among four essential requisites of the art of study. "To behold," as Humboldt says, "is not necessarily to observe, and the power of comparing and combining is only to be obtained by education." Observation of a great violinist's art means far more than the effort to memorize an impression. A musical performance is but an evanescent thing, and its thousand details of beauty and imperfection cannot accurately be stored away in human memory. But if this were indeed possible, a mere accumulation of such details would still be far from being observation in its truer sense. Truly to observe a player's art means not only cognizance of its characteristics, but careful investigation and exact knowledge of their origin and cause. It is not enough merely to remember that a player has produced a beautiful, sympathetic tone in passing from one position to another. The remembrance may act as an incentive to create an equally beautiful tone, but it necessarily remains only a mental record of the effect, and does not help to reveal aught of the process of its production.

Possessed of the knowledge of technical processes, the most serious obstacle to achievement is removed. This knowledge enables the player to proceed with the greatest economy of mental effort and valuable time. No longer does he flounder and grope in the dark, but goes straight to the shortest and surest road, avoiding innumerable pitfalls. No longer does he blindly endeavor to imitate what he has heard, but, understanding thoroughly the *principles* which underlie what he attempts, he sacrifices nothing of individuality in the attainment of his end. Thus does observation contribute to original expression.

Analysis is, in the art of study, closely related to observation. It is, so to speak, a minuter investigation of what has been observed. Important a factor as it is, however, both in technical achievement and in the development of originality, there is in the pursuit of it always an element of danger. Music justifies and demands a certain degree of analysis, but never tolerates it in the form of absolute dissection. Scientific analysis, for instance, of musical emotions, must inevitably end in either the suppression of those emotions or in their absolute extinction. This is the danger. It is difficult, perhaps impossible, to draw the dividing line between profitable investigation and destructive analytical methods; but the endeavor to be on the safe side of such a delicate question leads one naturally to the following conclusion: In all that appertains to purely technical matters, the coldest and closest scrutiny may safely be recommended; but outside this region there is unmistakable peril in every application of the dissecting knife.

Comparison, too, is related to observation, for it gathers together what has been perceived and heard and felt. But it has its own particular field of profit and activity. It seeks to differentiate, to weigh one quality against another. Its vast accumulative possibilities offer the mind an endless variety of opposites; and these opposites, considered first by themselves and afterwards contrasted, form a remarkable assemblage of educational facts. Consider the work of the two great artists, Joachim and Sarasate, each a unique representative of a distinct "school" of violin-playing. Great profit can certainly be derived from a general comparison of their work; but if we scrutinize the various methods employed by each in the performance of a particular concerto (let us say, the Mendelssohn), and then compare their respective musical and technical achievements, the value of such comparison is greatly enhanced by the consequent revelation of extraordinary facts.

Now, such comparison, to be truly serious and instructive, should not take into consideration technical flaws which are obviously the result of accident. Experience soon enables the thoughtful student to distinguish between temporary disorder and actual inefficiency. The groundwork of comparison must not consist of puerilities It must neither magnify a mere mishap, nor seek to transform it into a chronic and vital weakness.

The comparison may be conducted as follows: (1), The Tone—its quality, character and variety; (2), The Technical Equipment—its character, fluency and precision; (3), The Phrasing—its beauty, logic and characteristics; (4), The Style—its strength, purity and individuality; and (5), The Interpretation—its refinement, intellectuality and impressiveness.

Selection separates the good from the bad, the desirable from the undesirable. It is the outgrowth of Observation, Analysis and Comparison. It reveals your musical and instrumental virtues, it bears witness for or against you. What you ultimately accept or reject decides the quality and character of your art, and proves how well or ill you have observed and analyzed and compared.

Though, in a certain sense, this fourth factor is the weightiest one of all, it is clearly *a result*, a development of the other three. You observe, you analyse, you compare, so that you may, in the end, be properly qualified to select.

The moral quality contributes sincerity, veracity, solidity of structure; the intellectual quality is disclosed in order, lucidity, and grasp of thought; the artistic quality is seen in symmetry, proportion, beauty of construction and of detail; the spiritual quality is revealed in depth of insight and the scope of relationships brought into view between the specific work and the world in which it is done.

As the master workers gave form and substance to their visions and insight, the power to see and to understand deepened and expanded apace with their achievements.

A NEEDED ACCESSORY IN TEACHING.

H. L. SPAFFORD.

While the art of music is one of which, comparatively speaking, so little can be understood or fathomed of its deepest meanings, a fine mental discipline is gained in the study of how best to impart even its simplest principles. To present truths skillfully and clearly to all classes and orders of minds requires not only a clear comprehension of that which is to be imparted, but also an ability that can be gained only through close study and original thinking on the part of the teacher: that of being able to analyze readily the state of mind he would instruct, to understand what difficulties are in the way, and to remove them. He must be able to express his ideas clearly in a great variety of ways, cultivating constantly the imaginative faculties as an aid in the use of apt illustration.

Thus it is evident that a *well-trained mind* is an all-important necessity to the music teacher. But after all, there are many differences of opinion as to the nature of the training requisite. Are there not schools of music in which students may complete a course of musical study, and graduate without giving evidence of the slightest acquaintance with any of those branches of study which are considered so important in other special lines? Do our Schools of Music require any standard of proficiency in Mathematics, Sciences, Latin, and English before they send out their graduates "full-fledged musicians?" Perhaps there are some who imagine that the study of music itself is sufficient for the necessary development of the intellect, and that the time which would be expended in the acquirement of other things is more advantageously employed by giving it all to the study of *music*. This would easily account for the predominance of "cranks"—or people of one idea—there are in the musical profession.

The study of music itself may be made a fine mental exercise, but only to that student whose mind has already been so thoroughly disciplined that he can enter into the hidden truths that lie so deep in music. Music is philosophy—only to the philosopher.

Let it then be conceded that the music teacher has as much need for first-class college training as any other professional man. He needs Mathematics and Latin, Greek, Natural Sciences (especially Botany and Geology, that he may learn to observe with the eyes as well as the ears), English, and, if possible, German and Logic. He needs also to confine himself, more than any other man, to the classical in literature. For music renders one's mind peculiarly susceptible to the influences of highly-wrought emotional literature, while he, of all men, needs precisely the opposite style. The lawyer, who, in his professional work is constantly engaged in plain matter-of-fact thinking, should doubtless often indulge in Dickens and George Eliot, but the musician would do better to read Homer and Chaucer.

To consider briefly what benefit the musician is to derive from these studies besides the mental training which he so much needs, we find that:

He will save much time. This is not mere supposition, but is based on reason and actual observation. Most persons who study music alone spend ten years in learning as much about music as they ought to learn in four or five, for the sheer lack of ability to comprehend the principles involved. A prominent teacher of music, who teaches in a conservatory of music, and also part of his time in a classical school, was heard to say that his pupils in the classical school made much more rapid progress, in spite of the fact that they carried a full collegiate course in addition to their music, than his conservatory pupils, who studied music alone. If time is saved, even in the preparation for the teacher's work, how much more will be saved after the regular independent work of teaching begins.

He will have a wider influence; and, finally, he will teach more wisely and safely.

How great is the responsibility which every teacher bears. So many young lives are blighted by unwise, uncultivated teachers, who either induce their pupils to squander their time and talents in unprofitable things, or at least fail to lead them in the right direction.

While there are other and not less important benefits that the teacher would receive, all may be comprehended in a strong, final statement—that the man who has a thorough general education, with no previous musical training, will succeed as well teaching music as the life-long piano player who has had no general education.

The M. T. N. A. Convention.

The M. T. N. A. has just rounded its first quarter of a century in admirable style. What was at first a very small and feeble plant, has struck root downward, and spread out its rootlets in every direction and lifted its ambitious stem and extended its flourishing branches till it is now a great tree, full of fruit, and still fuller of the blossoms of promise. Despite the fact that it has rounded some sharp corners financially, and has at times seemed to lose hold upon the general mind of the nation, it is now in a solid condition and with a fairly representative constituency, which may justly claim the name, National. There is certainly much yet left for the musicians of the United States to do, and many and complex are the questions which press for a solution, for music is a vast subject, and the society is so expansive and so cosmopolitan in its aims and scope that nothing musical is alien to it. The spirit of the membership, however, is free from overweaning selfishness, and there is a brave confidence in attacking live questions which in itself is an augury of certain victory.

The session of the Senate of the body assembled on Tuesday, the second of July, at Put-in-Bay, as proposed and the attendance was good. The burden of the president's message was the recommendation of a closer and still closer relationship between the National and the State societies, for much of the work done in the way of papers, debates, recitals and the like, may be as effectively done in the more local body, while the shorter distances render attendance easier and relatively larger. This matter of distance will always be a modifying element in the construction and operation of the M. T. N. A., and it is idle to think of utterly doing away with it, but there may easily be constituted a really representative and active body of delegates whose action may be made a most positive and recognizable force in the work of the country.

The complete gathering took place on Wednesday the third, and the program as announced in the printed prospectus, was carried through the remaining three days with a remarkable degree of exactitude. Indeed, very seldom has there been so near an approximation to what was desired and announced. The morning was opened up bright and strong with the various specialties in separate sessions, each presided over by a competent man. The Public School music which, was the very core of the system in the State of Ohio, and has always been a most vital active force in the M. T. N. A. as well, was in charge of the former president of the society, that versatile and accomplished musician and promoter, ex-President Gantvoort, of Cincinnati. The questions which come into the discussions of these teachers of the fundaments, while intensely interesting to those engaged in imparting them to the children of the country, are necessarily so minutely technical as to be quite impracticable to use in a public report for the general musical reader, so I must content myself by saying that there were many earnest men and women present, and their debates elicited much suggestive and helpful talk.

The department of piano was presided over by Mr. O. W. Pearce, of Indianapolis, and the question of ornaments was presented by Mr. Corey, of Detroit, and debated with spirit. In the theory specialty, the questions of diatonic and chromatic harmony, and of the best way to use text-books and a number of kindred ideas received attention, while in the voice department, Mr. Perley Dunn Aldrich, of Rochester, N. Y., gave a lucid exposition of the nature of resonance, calling out, as one always does when the voice is the matter under debate, a vast deal of lively talk.

The latter half of the forenoon was devoted to the hearing of a general lecture upon music and its relations to the whole subject of human culture, by Prof. W. S. Pratt, of Hartford Theological Seminary. This lecture gave, in a clear, didactic and formal manner, precisely similar to the discourse of a professor before his class, a goodly number of sound and solid ideas as to the various ways in which one might be a musician, how each may be most successful and happy, and what is the duty of each class toward the other. One of the most important features of Mr. Pratt's lecture, was the glorification of the usefulness of the amateur in the scheme of musical life, and the exhortation of the musicians who work in the art to read, read, read.

Each afternoon was occupied, as to its first half, by a new feature never before used in so definite a manner in the M. T. N. A. This was a lecture lesson upon piano technique, and another upon the voice, each given by one person and made in the form of a regular series of instructions as to pupils. Here the work in the piano specialty was entrusted to Miss Kate Chittenden, of New York City, who presented her ideas with such clearness, accuracy and orderliness as to be of great benefit to the large numbers who attended. In like manner Mr. Wodell, of Boston, carried out a series of logical lessons upon the foundations of an artistic voice, and many eminent specialists, among them Mr. Frederic W. Root, of Chicago, Mr. Aldrich, of Lexington, Ky., and Mr. Blumenschien, of Dayton, Ohio, and others took part.

Here again, as in the round table discussions, there was a vast detail of animated talk and it took a wide range, but throughout there was a marked spirit of brotherliness, of gentlemanly breeding and of cheerful good-will quite refreshing to observe. No casual stranger who dropped in upon one of these lessons or round-table discussions, would have for a moment been reminded of that old, old, old remark, which has certainly been worked to death: "Musicians are the most irritable and conceited people in the world." There never has been much of this irritability in the M. T. N. A., and this time there seemed to be less than usual.

Of this entire department of the work, *i. e.*, the strictly didactic, it may be simply said that there was so wide, so progressive and so comprehensive a view taken, that every teacher who attended and listened with concentrated attention, certainly obtained from these alone the full value of the outlay necessary to secure the trip and the membership, even in the enlargement and sharpening of the special knowledge in which he or she was particularly concerned, and all the delights of the recitals and the powerful stimulus derived therefrom was additional.

The first artist to be heard was the great American virtuoso and teacher, W. H. Sherwood. He, in collaboration with Mr. Marcosson of Cleveland, presented a large and impressive program in that large and impressive manner for which he is famous when he is in his best trim. His art, if not fully at its best owing to certain unlucky embarrassments in purely physical conditions, nevertheless was admirable. Mr. Sherwood was not able to play the piano of his choice, because the wrong set of legs had been sent, so he was compelled to use another which was in very indifferent condition, and that he could secure such fine finish, clearness and manly breadth of interpretation under these circumstances, certainly redounds greatly to his credit. He gave beside a number of brilliant and lyric solo pieces, two most interesting sonatas for piano and violin, in conjunction with Mr. Marcosson, the distinguished violinist of Cleveland.

The evening of Wednesday was surely a red-letter time, for it brought us one of the most fascinating song and piano recitals ever heard at this or any other convention. Those two superb artists, Messrs. Hamlin and Biden, both of Chicago, gave us something entirely unique and as charming as it was unique, viz., a recital consisting of duets and soli for male voices. The art of these gentlemen is so admirable that the West may well be proud of them, and it was pleasing to note the surprise and honest delight of the men from the East. Mr. Hamlin gains with every year, and to-day has few, if any, peers among American tenors. Mr. Biden has just returned from three years with Alfred Blume, the teacher of Brema, Pluncket, Green, and others of like caliber. The range of the program may be guessed by the names of the composers chosen from. Schumann, Weingartner, Bruckler, Brahms, Sjogren, Hildach, Göetze, Franz—was not that an array? These songs were sung with great finish and spirit, and the applause of the public was rapturous. The difficult task of accompanying all these intricate things, where the tone-picture lies quite as much in the piano as in the voice, was admirably sustained by Miss Elinor Scheib, of Chicago. This young lady has a positive genius for this charming and highly artistic work of accompanying. Mrs. Cragg, of Detroit, contributed a series of interesting piano solos, among which there was a really musical polonaise, by Mr. Hahn. The playing of the lady was nimble and in a high degree artistic.

The morning of Thursday opened full of energy and activity with the specialties as before, with Mrs. Thomas upon Normal Methods. She unfortunately was afterward called away, and this constituted the only break in the entire program. The last half of the morning was given to a fine and varied concert of a highly instructive character. First there was a novel feature, which was the playing of three noble works for two pianos by two of Cincinnati's prominent artists, viz., Mr. Philip Werthner and Mr. George Schneider. They gave us a lovely concerto for two pianos with orchestra by that prince of pure beauty, Mozart, then a superbly ingenious set of variations in the Protean style of extreme transformation which Brahms so loved, and lastly an equally ingenious, and perhaps more touching and heart-stirring one by Sinding. The delivery which these works received was clean, solid and masterly. Mr. E. R. Kroeger, of St. Louis, appeared with Mr. Sol Marcosson in one of his own duo-sonatas, and both the work and the performance merited high praise. Mr. Kroeger is an earnest composer who has ideas and his handling of them is usually that of a skilled tone-constructor. Mr. Moore, of Detroit, sang with a thrilling and robust tenor tone, a number of American songs, by Brockway, Mrs. H. H. A. Beach, Ford and Van der Stuecken. Again I was reminded of the impression which I always have when hearing American compositions, that they are most certainly meritorious, and at times have a real swing of inspiration which melts the listener's heart, but more frequently they only arouse respect. Never mind, however, we are arriving, and like Paracelsus, we shall arrive. I am one of the optimists for America in all ways, music and musical creation not excepted.

Thursday afternoon brought to our attention a remarkable pianist who has not half the reputation which he deserves, viz., Mr. Alberto Jonas, of Detroit. This artist is a most distinct and recognizable quantity. He has technique in abundance, not absolutely without flaws or limitations—who does possess any such fairy gift as that? And behind this technique there is an artistic personality full of fire and the true tingle of the divine spark. When it is called to mind that Mr. Jonas is quite hard of hearing, some of his roughnesses and blurs are amply accounted for and the charm of his playing is augmented to a wonder. He certainly hears music in his heart and soul, and he can deliver it to us through his fingers so that we glow and shiver under its impact. Mrs. Clements, of Detroit, gave a number of good American songs, among them a series by that distinguished teacher, J. H. Hahn, of Detroit.

Thus far our American composing genius has manifested itself mainly in the sonata form, either solo or duo, more rare in quartet. Again in the musical piano sketch which is now-a-days quite the elegant fad in songs of the diluted German sort, with much striving after honest accents of heartfelt emotion, and with picturesque accompaniments, and in salon pieces of more or less depth or shallowness, and finally in Church music in every possible form, particularly the standard anthem form. We have done much good work also in orchestral writing, and many American concert overtures and symphonies are fully up to all that is done in Europe, if the half dozen really great stars of the first magnitude such as Saint Saens, Richard Strauss, and the like, are omitted. Of these two very noble and important styles, the orchestra and the sacred, we had no opportunity to take any taste or pass any judgment at this meeting of the M. T. N. A., and for this there were two convincing reasons: First, the hotel which was perfection in every other particular had, of course, no pipe organ, and furthermore, the effort made on former occasions, notably at Detroit in 1890, to bring out large American works with grand orchestra, gave the M. T. N. A. meetings too much the character of a festival, and somewhat militated against its strictly educational character.

The trend of recent opinion and effort is very decidedly toward the educational side of its work and here there is at once more hope of success and a greater need for its influence. If there could, by some means, be secured an organ for next year, the arrangements would be much improved, and it would certainly be quite within the bounds of the feasible to have that exquisite and in America seldom heard type of art, the string quartet, represented with complete adequacy. I am inclined to the view that we run our programs even yet too much to display occasions for singers and pianists, especially the latter, and everything which tends to sink the individual in the art,

would be welcome. There is such a vast amount of treasure in the store-houses of concerted music that it seems positively a shame to lose or consume one moment at such an assemblage in hearing the tinkling or tril'ing or piping of the soloist, while we might be learning the richer and higher things of Art's holy mysteries. The example of Messrs Werthner and Schneider was most commendable in this regard. They gave us nothing but concerted music and thus we heard that which is not hackneyed and is of a higher and deeper order of musical beauty than any mere single performer can call out.

In the evening of Thursday the opening number was a performance of that historic piece of violin virtuosity, "The Devil's Trill" of Tartani, given in good style, by Mr. Yunck, of Detroit, the leader of the Philharmonic Quartet of that city, and Miss Agnes Andress, pianist. There was at first a little indecision or uncertainty as to their mutual intentions, but in many particulars it was a fine performance. Mr. Yunck has a large and noble tone. Mr. Fletcher Norton sang some songs from Grétey, and in his French he was good, using that full nasal resonance which is native to the genius of the French language, but so little understood or relished by those who do not know that tongue. In singing English his French manner was not quite so appropriate or fortunate. The protagonist of Thursday evening was the pianist, organist and composer, Arthur Foote, of Boston. This gentleman is one of our most genuine and capable art-workers, and whatever he does bears the stamp of sincerity and native ability. His sonata for piano and violin, in C minor, Op. 20, is certainly a good work with stuff in it, and at a recent performance of it upon a program, in Cincinnati, it took the audience even better than the Op. 18, of Richard Strauss (his only work in that form) but, for my part, the piano and string quintet of Mr. Foote, in A minor, is a better work. Later he delivered a set of four pieces, Op. 41, based upon quatrains from Omar Khayyam. These were musical sketches embodying the moods of the poetry and they did it admirably. The third and fourth, particularly the latter, delighted me. The reflection of the melancholy, uttered by the poet upon contemplating the brevity of Man's life in contrast with Nature, was excellently given by the sad, wandering melody, in E flat minor, in the left hand. Mr. Foote is a man whose music is music and not merely good mechanical practice work.

After the evening concert there was an informal reception which was, in many ways, very enjoyable. The object of these occasions is not, or certainly should not be, the mere exploitation of solo players, it is to bring representative members of the fraternity of music workers into closer and more mutually appreciative relationship. This reminds me of two things: first, the deplorable habit of the artists who rush in, play their little string of tunes and rush for the next train; and, secondly, of the total misapprehension on the part of the artists as to their real function and value. For example, there were ex-officers of the Association who played, then made a bee-line for the boat, quite forgetting their own former exhortations to others to stay and meet others and contribute to the occasion. Again, one of the pianists said to me, what I have often heard before from such members, that one recital did more good than a dozen speeches and debates.

As one who has looked at music from every possible point of view and cultivated several of its branches, and as a member of this M. T. N. A. since its very inception, I feel deeply and strongly upon this head. It has been a matter of pain and surprise to me to hear sentiments from my intimate friends which were models of inconsistency. For instance, an eminent pianist, who has been at the assembly many a time and oft since the beginning, once asked me, some ten years ago, "if they had really accomplished anything?" Yet, on this occasion, he ran in and played and ran away. This spirit seems to be practically universal with the music-makers of the occasion, and to hear them one year inveigh against those who take no more than a selfish interest in the society, then the next time, in a year or so later, do precisely the same thing which they have condemned, is enough to make one smile first, then sigh, alas! for poor human nature. The letters, M. T. N. A., stand for Music Teachers' National Association and not Musical Artists' Association and, for one, I should be glad to have all recitals and artists' concerts abolished and let it be in no sense a festival, but a real convention of the art of music, who come together to debate the teaching of the art and to compare experiences and to cheer and console and sympathize and hearten each other upon a mutual ground of neutral territory, where the possible warping of rivalry cannot come in to do mischief and vitiate judgment.

Were there only such picked-up concerts of extemporary volunteers as we used to have at the Ohio Association and the M. T. N. A. in its early days the society would achieve its purposes well, possibly better than now. However, far be it from me to decry the value of the models of art which the virtuosi contribute. It is only this narrowness and spirit of rivalry and mere business competition which, it seems to me, militates in no small measure against the real object of the Association and its highest usefulness to the world, which I regret and protest against. Some years ago I heard a German musician of high abilities, from Cincinnati, who had himself often read essays and made speeches, as well as played before the O. M. T. A., says that the debates would kill the society, yet he has been dead seven years and the O M. T. A. is stronger than ever.

On Friday morning the various specialties opened in full force, and among other valuable matters certain questions of a much-needed reform in pedal notation were brought out. Certain it is that the utter barbarism and senseless confusion in the nomenclature and the typography of our art does much to keep it still from free and full recognition among the sciences and in that high and honorable place among the humanities which it certainly deserves. Such bodies as the M. T. N. A. can do much in this line and owe it to the art and profession so to do. The morning of Friday brought us a thoroughly enjoyable recital from Mr. Alan O. Spencer, of Chicago, pianist; Miss Camper, of Flint, Mich., soprano; Mrs. Bonbright, accompanist, and Mrs. Lillian Apel Emmery, of Detroit, pianiste. Space would not permit a detailed analysis and comment upon this program, but a few words ought to be set down. Mr. Alan, in his brilliant and decidedly modern program, gave evidence of a good, strong touch, full of resonance and elasticity, and also a true, artistic feeling for the work in hand. In such strongly contrasted things as the Scherzo, Op. 4, by Brahms, and the Improvisation upon the Prize Song from the "Meistersinger," he gave us more than a taste of his quality – it was a good proof of it. This Scherzo, by the way, is that work of the boy Brahms, which caused Robert Schmann so to blow the trumpet of glorious annunciation and thereby lay the foundation for that wide acceptation of Brahms in the inner circles of the cultivated which gave him his enviable hold upon the publishers and enabled him to live like a lord all his life and yet leave a fortune of one hundred thousand dollars behind him. Lucky, lucky Brahms; noble, noble Schumann. The Scherzo, however, is a singularly solid and masterly work, sounding like the work of a master in every bar. Mr. Spencer gave it a fine reading and therein showed us that he can do classic things. Next he played the brilliant and bewitching Fantasie, by Schuett, upon Walther's Preislied, and there the free, impulsive modern manner was equally well caught. The fact that Mr. Spencer is not only an American, but that he is American in his education and, still further, that he is self-educated, endears him triply to our good-will and affection America is the land for all, and we welcome all the musicians of the older and maturer countries to our friendship and our patronage, yet we cannot repress an especial gush of joy and pride when one of our native citzens, of his own motion and energy, achieves so much as Mr. Spencer has done. He made a strong impression upon his audience and his part of the recital was a shining success. Mrs. Emery also delighted us with her refined and most lyric playing. Her way of defining her melody and of subduing her secondary voices might be taken as a model of that form of art. Miss Camper was an acceptable singer, and one feature of her set of selections ought not to be passed over, viz., the choice of two songs by two negroes. The poet was Paul Laurence Dunbar and the composer S. Coleridge Taylor. The one is an American, the other an Englishman.

The absence of Mrs. Thomas, with her lesson-lecture upon Normal Methods, left the afternoon empty and, consequently, the recital of the last evening was moved up to the afternoon, and the evening was devoted to a moonlight boat-ride.

The last pianist whom we heard was Mr. Buddeus, of St. Louis. This gentleman is evidently an artist of no mean pretentions, but I feel sure that we did not have a fair opportunity to test him. He belongs to the rather conservative German species of the genus pianist and is a product of the school and environment of Leipzig. Those who have heard many pianists and who are accustomed to analyze, know at once just what I intend to convey. Works of the older forms were given with a better understanding and with more evident warmth of personal relish upon the performer than the more impulsive, impassioned modern compositions. By this I do not mean to cast any aspersion upon his work as an all-round pianist, but merely to indicate his trend and proclivity. Everyone in the world, who is worth talking about, has a trend and a proclivity, and so Mr. Buddeus may well keep such a cast of mind about him.

In concluding, I have the agreeable task of paying tribute to a most gifted vocaliste. Mrs. S. C. Ford, who sang upon the last afternoon, quite electrified us with her voice and her art. She is a really great artiste with her voice and quite recalls and stands near to Nordica. Both in brilliant dramatic music and in colorature music and powerful utterances of joy and in the softest breathings of tenderness, she seemed equally at home. Her scale has that equality which indicates the artiste, and up to G, above the line, the notes are superb in fortissimo. Then, in the altitudes above the staff, her flute-like covered trill is of charming freedom and purity. She sang in three languages also, and in all the details of vocal art showed us that she is a high-art singer. Those who did not hear her were unfortunate.

Here closes my panegyric and my jeremiad upon the M. T. N. A. of 1901 and, taken for all in all, I think it one of the best, most earnest and most educationally effective session which the society has ever held.

J. S. Van Cleve.

AMPLITUDE OF KNOWLEDGE.

A recent description of the course of music of a well-known music school, says: "The pupil who completes this course knows a stretto from a stringendo, an exposition from an episode, a ritornello from a rondo, a mazurka from a minuetto, and a lot besides." Perhaps they can also rattle off the following:

Risoluto, rallendo, romanza and bass,
Impromptu, innuendo, introit, ecossaise.
Pianissimo, plagal, pesante, passipied,
Largamente, legato, leggiero and lied.
Ballade, brioso, boureé, barcarolle,
Moderato, maestoso, marcato and moll.
Scherzando, sforzando, senoso and score,
Bolero, buffo, balleto and bore.
Cabaletta, cachuca, cadenza and brace,
Cantilena, calmato, cantata, vivace.
Cavatina, caprice, cantus fumus, canzone,
Chorale, concerto, crescendo, chacone.
Portamento, pavane, polacca, courante,
Cantabile, chorus, coda and chant.
Grandioso, gruppetto, gustoso, gavotte,
Diapason, da capo, dolcissimo, dot.
Ritardando, rubato, romanza and line,
Fantasia, fanfare, fortissimo, fine.

Berenice Thompson.

There is more to music than the ear discovers. To those that know it, one of the most important qualities is its appeal to the eye. Experts read a musical classic as they do a famous poem or a standard novel, and they skim or peruse new music as they skim a newspaper. They claim, indeed, to derive almost as much pleasure from what is literally "reading" music, as from playing it or hearing it played. One learns to read music as to read books; picking out each note with hesitant deliberation, as a beginner cons the letters of his primer; constructing the chords laboriously as a child groups the letters into a word, and combining the chords into a phrase as a child builds up its understanding of a sentence. In time the reader of books learns to grasp a word as a whole without any conscientious spelling of it. Gradually he is able to take in a whole sentence at a time without pausing to study its separate words. So the practiced musician reads his notes, and such a virtuoso as Liszt is said to have constantly read eighteen measures ahead of the measure he was playing. To the physiological psychologist, one of the most marvelous abilities of the human mind is a trained pianist's rapid performance at first sight of a brilliant composition.

No one is ever idle or lonely unless he wishes to be the one, and deserves by his unlovableness to be the other.—*Miss Mulock.*

If we could read the secret history of our enemies, we should find in each man's life sorrow and suffering enough to disarm all hostility.—*Longfellow.*

THE VOICE.

MR. FRANK HERBERT TUBBS, Associate Editor.

With this issue we continue the series of answers to inquiries. We have been running articles of a pedagogic nature from which material for study has been derived. Now we purpose giving a very practical trend to this department by answering questions sent us by teachers and students. This instalment shows the helpful character of this department. We will welcome inquiries from all who desire help.—Editor of THE MUSICIAN.

INQUIRER'S DEPARTMENT.

FRANK H. TUBBS.

My attempts at breath control only resnlt in failure; what is my fault?

Without personal acquaintance it would be probable that the wrong fault might be pointed out; but, in the experience of the writer, every cause for failure to obtain good breath control comes from trying to use muscles to hold the breath which are not the right ones to employ. Now, are students to be blamed for going wrong, for even in accepted text-books there is wrong instruction on this point and many teachers are bewildered. One book examined recently directed students to hold the breath entirely by the muscles of the back. A teacher of some little prominence says: "Press out the abdomen where you inhale and hold it there firmly when you sing." Another says: "Raise the chest! Chest up and out!" Any one of these will result in failure. The first has merit, but the last two are positively harmful. Probably the student who, in the question quoted, asks about his fault is using one of these ways.

Breath control is secured by gaining command of the diaphragm. If no other muscle was trained, that command alone would give good breath control. For large vocal work any muscles which can assist the diaphragm need to be employed, and if we train the back muscles as *assisting* muscles he will do well, but he must train the diaphragm first and all the time as the basis of control. Presently we will give an idea of how to do it, although these pages have had many words about it. The matter is so important and is so often lost from mind that it should be called up again and again. The reason why distending abdomen or chest prevent breath control is because the effort put into these parts works against the diaphragm and compels it to give way. As well ask a boy to stand still when you, a grown man, are pushing him along the sidewalk.

There are no muscles in sight or which can be felt by sensation which have any great influence upon breath control. The diaphragm is out of sight, extending directly across the body at about the level of the end of the breast-bone. (On the sides a little lower) The body is like a two-story house and the diaphragm is the floor of the second story. The object to attain in breathing for singing is to get that "floor" to stay still. What, then, could be simpler and more effective than this: when breath is taken that "floor" is down at its lowest level and is quite flat. (Techn.cally, it is not so, but practically it is.) When the breath is thus taken the lungs, bronchial tubes and mouth are full of air. That air is part of the air in the room and is (if you let it be) just as still as the air in the room. Just hold it so as long as you can. That is holding the breath. Don't try, by any special muscles, front or back, to hold, but let the air within stay as quiet as is the air in the room. Such training gives command of the diaghragm and gets one—anyone and everyone—good breath control. If one cannot get it with that it is his own fault, for that is the thing that gets breath control—securing the stillness of the diaphragm. One should practice in this stillness every day. It is not enough to know how. One must put the knowledge into use every day.

●

Can one, who is not imaginative, become a good singer?

Three things are needed to make a good singer: voice, intellect and imagination. One who has the first two will make a cold singer and he needs to add to his possessions the third member of the trinity. The question then becomes one of ability to add imagination to his nature. That does not, however, state the case quite fairly. No one is entirely devoid of imagination His duty is to awaken it into activity and to have it as a force at command, ready to use at any time that faculty which he already possesses. Everyone can become a good singer. All possess the three things needful. "Believe and it shall be added unto you." Every child lives in a realm of seeming. The little girl fondles a doll and it is to her a living thing. The boy plays horse and he is a real horse. They are creations of his imagination. Unfortunately, the early training of our children crushes out, in many cases, these mental creations. Our parents cry "nonsense." We believe them and make over our natures into matter-of-fact, practical things, with the beauties of childhood left out. What do we become? So far as art is concerned we are sticks. Becomes as little children again. Those sacred words, uttered by the master, "Except ye become as little children," etc., have far-reaching meaning. It is a "Kingdom of Heaven," this art of music, and it can be entered only as children, or by such as can make themselves children. We are cultivating the singer when we cultivate imagination. We need not return to dolls and playing horse, but we can see the be utiful things which appeal to the adult. The beauty of nature, the sympathy with sorrows, the possibi ities of doing good, all arouse the higher nature within us. To a student who lacks imagination we say, most earnestly, study those things which point out to you the beautiful and the sublime. Deepest emotions are least expressed in the words of the poet. Take the writings of any inspired writer and fathom their deepest meanings and they will picture to you what cannot be clothed in everyday prose. A Wordsworth or a Browning can do more to make you an imaginative singer than can any vocal teacher who lives.

In the study of songs study particularly the climaxes. Every song of merit has some particular point which is to be brought out. One or two periods (of eight measures each) are needed to state the case and these can often be sung with the intellect. Imagination plays the secondary in them. But when you come to the climax let imagination have full play. Intellect is, at that time, the guiding force and not the controlling force. Throw your whole heart and soul into the imagination and pour out the meaning which is suggested you in the words when you come to the climax. Then, if the voice is trained and intelligence is used, the singing will be beautiful and grand. If one is not imaginative, he can become so and in this way make himself a good singer.

●

Can one train the voice as easily in low altitude as in high?

Whether success is dependent upon environment is a question which may well be taken into account. It is to be settled upon the idea of whether mind or material is the controlling force. Most people are affected by surroundings; a few have learned that success is not a result of external influence. The latter class frame laws for itself. In all things in which the body is to be considered this class hold a superior position. It takes no thought for the morrow. Food and clothes enter less in their consideration. Health is not dependent upon the morning bath. They have learned that results are the outcome of ideas held in mind. The beliefs and resultant thoughts of to-day are the creators of the conditions of to-morrow. Surely, those of this class would be able to use their vocal powers anywhere. The question asked would have no meaning to them.

But the majority of mankind has not yet reached this exalted position. The physician is still needed for those who have not become, through mind, capable of being their own physician. These people must not be neglected. They must be cared for as children are looked after. Those among them who are singers need advice and they are influenced by surroundings. One of the most far-reaching influences is climate. In clear and dry atmosphere they can sing better than they can in heavy, damp air. In the mountains they feel more at home than they do at the seashore. They never sing well on an ocean steamer.

It is undoubtedly true that where one can sing the better—where one can lay bare his voice so that he may inspect it—he can get on the faster. This would say that the voice can be developed faster in high altitude than it can be in low.

When one leaves such place he will miss some of the ring and brilliancy of tone he had. It is not the fault of his tone production so much as it is the misfortune of poorer material on which to transmit his tone. He should take this into account and not expect so much of himself. On the other hand, one who has been trained in low altitudes will find his voice more buoyant and beautiful when he goes to the mountains. A student, trained at New York, was surprised at his voice when he reached his home at Atlanta, Ga. The difference in altitude had much to do with the change in voice.

●

Teachers sometimes advertise to train students from the beginning till they are capable opera singers; can any one teacher do this?

The question resolves itself into the problem of whether it is necessary for vocal teachers to adopt specialties or not. It is one not so much upon possibility as upon expediency. Lamperti made his start as a vocal teacher by taking any material which he could lay hold upon and training it until it was efficient in grand opera. He demonstrated that a teacher could do it. Was Lamperti exceptional? We claim that he was not. He was shrewd at devices and necessity is the mother of device as well as of invention.

Demands in music have changed very much since Lamperti did his wonderful work. Modern music is much more exacting than was that of the Italian school. The teacher who can take the beginner and make him ready for grand opera must be greater than Lamperti was. Do we have such men in the profession? In all branches of mechanics he who becomes expert in one thing makes the great successes. In a glass factory no one man makes a tumbler. One blows it, another grinds down the high places and another burnishes or engraves it. Making a singer is a mechanical process. He must be taught to read music, to be musicianly, to sing well, to have "stage-presence" and to please his audience. It is very doubtful if any living teacher is competent to lead another through all these phases of development. Happily, the early musical education is cared for in our schools. The student goes to the vocal teacher for vocal culture and what may follow upon it. Voice culture is a specialty and is about as much as any teacher can master. When the expert in this branch tries to put his pupils into opera he finds something happens. There is a new field and one in which he is pretty sure not to be an expert. Few people can be great at more than one thing. Then, too, the teachers who launch students into profesional life know little about voice culture and the art of singing. One woman, at Paris, has succeeded in placing her pupils in opera much more frequently than has anyone else, but when she attempts to train a voice she makes a failure. So completely does she fail that it is sad. Her pupils cannot sing with any degree of artistic merit. Is it not better for the two kinds of teachers to work in their own fields? The specialist in voice culture should turn his pupils over to him who launches professionals. So, too, in the other direction he should not take away the business of the teacher of reading music and the educator. Each department is great in itself and there is enough in each to furnish study of a lifetime.

●

Why do we hear so much abnse of the qnartet choir in chnrch? Is it wrong in principle?

Mr. Moody used to say that a quartet choir was an abomination and yet we have known him to have one at his services. We do not want to accuse that worthy gentleman of having been inconsistent and must believe that "in principle" there was reason for the existence of the quartet organization. If it is ever an abomination it is because the principle was abused. When a choir monopolizes the music of worship it takes a place which it ought not to hold. Its work should be remodelled. Often the remark is made that no four people can properly praise the Lord. When the quartet takes away from the people the right to sing it is usurping too much. Again, if there is display of virtuosity on the part of solo singers, there is an element introduced into church services which does not belong there. These are the objections to the

quartet and give rise to the abuse of the quartet choir. It is evident that no four persons can lead, in adequate manner, the singing of a large congregation. They can, however, lead in the praise which the congregation offers in a more commendable manner than any usual audience can give. This is the reason why there should be quartet singing. Where the use of the quartet is based on that idea it is the proper thing to have in church. The ideal choir is a chorus led by four solo voices. Where this cannot be had, if there is a choir at all, either the chorus or the quartet must be had alone. The chorus, not led by voices, has proved itself, as a rule, a poor thing. If a chorus can be large and is well drilled it will furnish excellent church music. But it is safe to depend on a quartet. But this organization should be well-drilled. The misfortune in the quartet is that it does not release enough to do effective choir work. The voices must be made to harmonize well. "To blend" is the term used. This can be had only by constant rehearsing and after the singers have worked together a long time. As a rule, the better the voices the more should the quartet practice. There is always the spirit of individuality which must be expressed. When the soloists forget themselves and merge their individuality into the production of pure church music, the quartet becomes the most effective and convenient instrument to be used in connection with church services. If such a choir should take the place of the usual inefficient one the abuse of the quartet choir would soon cease. The principle is right.

Teachers should guard their own interests by making more efficient our choirs. Church singing offers the needed experience which soloists must have. If we so conduct ourselves that churches dispense with the choir, we abandon one of the most useful implements which we have in professional work. By our inattention to proper church singing we are jeopardizing our own interests. If the abuse continues the quartet will be given up and the blame must rest upon singers and those who make singers.

OPERATIC ARIAS.

Spirto Gentil. La Favorita di Donizetti.

W. LOWES-HEATH.

The study par excellence for tenors, to educate and give control in the mezza voce and economy of breath, and to aid in acquiring that quality and sustained style of singing, for which the old Italian masters of "il bel canto" were so famous, is without doubt the aria Spirto Gentil.

It is a beautiful masterpiece of one of the greatest of the old melodic writers, and is at the same time remarkable for its simplicity.

It demands pure singing from first to last, and when a tenor has once studied it, it becomes for him the standard by which to judge all other work, even though he be not successful in mastering it.

With all the grand music Verdi has given us, he still inclines his head to the inspiration that produced Spirto Gentil, and to be able to sing it after the traditions of the old school is regarded as the crown of an artist's achievement.

Although so simple in construction it *taxes* the singer to the utmost, and the one word "control," is the secret of its mastery.

It is a musical soliloquy in which Fernando, who sings it, tells of the dream of love for which he abandoned the monastery, turned his back on the vows that would have dedicated him to a religious life, thus drawing on his head the wrath of a parent who was also his spiritual superior.

In the moment when he believes himself arrived at the goal of his heart's desire, he learns that the woman he has lead to the altar is the discarded favorite of the king at whose hands he received her; his love has been mocked, his honor dragged in the dust, and the fabric of his happiness falls in ruins about him.

Outraged and broken-hearted he returns to the monastery, willing at last to devote to God a life that is worthless to himself, which was regarded as quite a legitimate and proper thing to do by these heroes of the middle ages.

We find Fernando in the courtyard of the monastery as the recitative opens:

"The favorite of the king! The royal mistress! What a black abyss of shame; what an infernal plot! The glory I had won overthrown in an instant; shattered every tender hope of a loving heart."

In the first two phrases Fernando repeats the words which hold all his disgrace and dishonor. The first phrase, "Favorita del re!" is given out at about half voice, for even yet it hardly seems possible that it can be true. Then comes a long pause between the phrases, and as he repeats the words in the second phrase, the whole force of the humiliating truth comes over him, and his voice is full of scorn as he realizes in what manner and how deeply he has been betrayed.

The next phrases follow each other in quick succession of passionate exclamation, in which the accent of the words is well marked.

In the phrase "E ogni speme tronco," there is a ritard and diminuendo, preparing the way for the last phrase "del core amante," which is taken very slowly and pianissimo. Instead of singing this phrase as it is written, it is more effectually rendered as it stands in Fig. 1:

ILLUSTRATION 1.

The mezza voce must be used throughout—the turn is taken very slowly, each note of it being accented—and the holds well marked. In singing this phrase, which tells how the heart is bereft of every dearest hope, the voice seems to weep, yet it must be perfectly under the control of the singer, and the long piano hold, which seems to be ever diminishing and yet retains a perfectly clear tone quality, is the effect of study and art.

In the aria Fernando's mind dwells on his dream of love which opened so fair, only to close in shame and dishonor.

"Beauteous spirit, in my dreams thou one day didst shine, but I lost thee. Abandon my heart thou lying hope, ye false shapes of love begone!"

"At thy side I forgot a father's tears; my country; even heaven itself! Faithless woman, in so much love thou didst blight my heart with a mortal shame, alas!"

The first three phrases and the first word of the fourth are very often sung in one breath, and are very effective when so sung:

ILLUSTRATION 2.

They are the test phrases of the whole aria, they recur quite often, and the study of Spirto Gentil means more the study of these phrases than anything else. They are taken quite slowly, with a sustained pianissimo tone which never varies, and no special accent until we come to the first word of the fourth phrase, "Ma," which is accented and cut short.

The next phrase, "Fuggi dal cor," is still piano, but in the portamento to the following phrase there is a crescendo, and the tone is full of sadness as the words "Mentita speme" are sung.

In the two succeeding phrases, "Larve d'amor," the time quickens perceptibly, the tone quality becomes bitter, and there is a marked crescendo, which works up to full voice in the next phrase. See Fig. 3:

ILLUSTRATION 3.

In the first part of this phrase the three eighth notes are well accented and ritarded a little, leading up to the G, which is taken full and held, diminishing in the portamento to C. The second part is taken pianissimo and ritards decidedly, the D receiving a hold and the portamento being well marked.

The next phrase begins the second part of the aria, which is more directly addressed to the memory of the woman who he believes accepted his love only to deceive and dishonor him. There is bitterness and reproach in it and the voice has freer play.

In the phrase "A te d'accanto del genitore," the time quickens. The first three notes are slightly accented, but the rest of the phrase receives only the accent of the time. The voice comes out freely, but not forte.

In the next phrase, "Scordavo il pianto; la patria; il ciel," the words "pianto" and "patria" receive an accent full of sorrow. The word "ciel" is also accented though not so decidedly, but it is held and modulated to a piano tone full of disdain and aversion, the voice is carried down by a dragging portamento and the next phrase "Donna sleal," comes out full of scorn and bitterness, each note, but more especially the D, being almost individualized by the accent.

The next two phrases, "In tanto amore, segnasti il cor d'onta mortal," are still full of bitterness, and crescendo till they reach the forte on G, the time accent being preserved.

The three G's follow each other in quick succession at full voice, the last being held and brought down by a gradual diminuendo to pianissimo, and in the same breath the voice proceeds slowly through the modulation and continues through the phrase "Spirto Gentil," which brings us back to the original theme. After this phrase breath is taken, but the following two phrases, and the first word of the fourth, are sung in one breath as before.

The ideas for these phrases and the four succeeding are the same as those already given for the first part.

The phrases "Fuggite insieme, larve d'amor," instead of being sung as they are written, are oftener, and with better effect, sung as they stand in Fig. 4:

ILLUSTRATION 4.

The time is ritarded considerably, the high A is held forte, as is also the D in the second phrase, which is sung very broadly and finished with a marked portamento.

In the next phrase the voice is allowed to rest, the time quickening with a slight rallentando at the close.

In the final phrase a cadenza is generally inserted, and this varies with different teachers. In Fig. 5, I reproduce one as heard in Italy:

ILLUSTRATION 5.

The cadenza to be effective must be sung very deliberately, the words clearly pronounced and full value given to the holds.

To study this aria with the object of merely adding a piece to his repertoire, will avail the student but little, as it can be reduced to fit almost any capacity. But if it be taken as a study in mezza voce and sustained singing, it will help the student to a realization of what true art means.

The accompaniment is of the simplest, and as the time is marked larghetto, the burden of sustaining the unity of the whole falls almost entirely on the voice, more especially in the opening phrases, which require the sustained quality of a violin tone.

For a young tenor whose voice would seem to be fairly well under control, the serious study of Spirto Gentil will be beneficial, for it will instantly make clear to him how much he really has acquired, and how much he lacks.

The following lines are supposed to have been written by the poet, John G. Whittier, in the summer of 1830:

"The pavements all are hissing hot—
The sky above is brazen,
And every head as good as dead
The sun can set his rays on.
The lean, like walking skeletons,
Go stalking pale and gloomy;
The fat, like redhot warming pans,
Send hotter fancies through me;
I wake from dreams of polar ice,
On which I've been a slider—
Like fishes dreaming of the sea,
And waking in the spider!"

It is character that makes circumstance, and character is inexorable.—*Mrs. Humphrey Ward.*

HEART OF THE WORLD.

Heart of the world, who knowest all mysteries
That rule our mortal joy, our mortal pain,
Say whether deepest satisfaction lies
In loving, or in being loved again.

Love treads no easy path; too soon it learns
The ache of patience and the pang of pride,
The deep unrest like the thirst that burns and burns,
The craving hunger never satisfied.

But still for every wound and every sting,
Wearily walking thorns and briars amid,
Love has for recompense this sweetest thing,
That it may love—and no man can forbid.

It is not given to every heart to win
For all its passionate urgence love's reply;
There are who knock and never enter in,
There are who lonely live and lonely die

But every heart of all the hearts of men
In this dear right has heritage and share—
The right to love, asking for naught again;
Quenchless as sun, unstinted as the air.

Ah, marvelous rose with glory in thy breast!
Ah stainless lily, wet with patient dews!
Heart of the world's heart, tell us which is best—
To love or to be loved—we cannot choose.

—*Susan Coolidge.*

WHY NOT SING ENGLISH?

W. FRANCIS GATES.

A goodly proportion of church and concert singers, and a larger one of the students of the art, bring their songs before the public as if the melody were all that was of importance, as if the words were there only on tolerance as a sort of necessary evil.

If this is true, if the tune is the "whole thing," why use words at all. Why bother with these sometimes awkward combinations of consonants; why not sing vowels exclusively? For, if we eliminate consonants, we eliminate language, the sense is gone. Why not come onto the concert stage and exhibit our vocal abilities by a series of vocalises—of vocal pyrotechnics, as it were?

Is not this a plain case of *reductio ad absurdum?*

Back of the song lies thought. The thing to be expressed is an idea or series of ideas, probably emotional, artistic, beautiful thoughts and high sentiments. Often, perhaps, the thought is not any too strong, or the poetical expression of it any too artistic, but that is the perversion and not the case at its best.

Back of the song lies thought; the poetry is the highest and most perfect way of crystallizing thought into language. Poetry is the most artistic, the most beautiful arrangement of language. Then comes the music as the most effective vehicle to carry the poetry, the most fitting means of presenting emotional thought.

The rose or the violet carries its subtle odor in a most lovely form. We may buy the essence of rose or violet and get it in condensed form, but without the beautiful texture and contour of the flower So, we may have hard rugged fact in the form of solid prose; but when it is stated in poetical rhythm and with all the delicacy of language, how much more artistic and beautiful it is. The odor of the rose is at its best when fresh from the dewy petals of the flower.

But who would care to put this rose or violet in so grand and gorgeous a vase that the beauty of the flower was lost by the very ornamentation of the mammoth vessel? Would not a simple and dainty vase of appropriate size be more suitable? He who would do so would take the expressive poetry of a Tennyson and so cover it up by an inartistic delivery or a blur of pronunciation that the thought and the beautiful expression of it be lost to the listener.

And then comes another question. Why sing to your audience in a tongue they do not understand. Just to show that you can scramble through a song in another language? Why not use the vocalise? Even granting that you understand the foreign tongue in which you sing, can you make them do so? There is a lot of "fad" about this anxiety to appear as having the gift of tongues.

When singing before his own people, a French or German artist having a choice of using a text in his own language or of substituting another, perhaps a translation, does not choose the language of which his audience knows but little. He sings his own tongue to people that understand it and expect to understand him. And woe be to him if they do not. The foreigner believes there is no tongue as good as his own. Why should we not have as much pride about our own language.

The Frenchman and the German learn how to sing their own language before venturing into others. In France, the singer who does not sing a perfect French is not tolerated, even though the voice be excellent.

Then why should we so abjure our own tongue and flee to those we know not of?

Those who agree in the ideas here expressed will enjoy the statement of the case recently made by Mme. Schumann-Heink, the eminent Wagnerian contralto. This lady says, "If your German is bad, sing the song in English. It will be more artistic to give the words their proper value and meaning as far as the translation allows, than to destroy the meaning by pronouncing the German badly. If it is beyond our powers to speak a certain language well, then we must sing our songs in that language that we do speak well. Our own poets are translated into English just as yours are into German. Again, I say, one's own speech is better than another badly spoken."

If every teacher of singing would hammer these ideas into the heads of his pupils, he would be doing them and their hearers a great favor.

Then comes some one and says, "This is all very good, but one cannot get the sense of a foreign poem in an English translation and we want to express the exact meaning of the poet." Yes, and express it in German, for instance, or Italian, to an audience of which not one person in a hundred knows any language but English!

The English can express nearly anything that another language will. It is rare that there is an expression in one language that can not be fairly well put into another. When there cannot, it is generally some colloquialism or idiom that is not apt to appear in art song. I do not mean to say that all songs are translated accurately, but I do mean to say that they generally may be; frequently there will be some other edition that will give a better translation than the one you have.

Consequently, the singer has the choice of singing his song in his own tongue, and (if he be one of the too rare people that have made sufficient study of their own language to sing it well) of being clearly understood by his auditors; or, of singing words that he himself does not know, perhaps pronouncing them in a way that a native to the language could not understand, and as a consequence, carrying none of the ideas of the poet to the listener. Why not sing vocalises?

The foreigner who knows no English, prefers to sing his own language to an audience of English speakers and understand himself, rather than try to sing the English and murder it, being understood by neither himself or the audience.

It may be a fairly good thing to sing a foreign tongue to an English speaking audience if one speaks well the language he is singing; perhaps there may be a few in the audience that will understand.

It is a better thing to sing a good German, French, or Italian to an audience that knows the language used.

But it is the best thing to sing a good English to an English speaking audience. That's the kind of audiences we have in this country, but not always that kind of singers.

Much teaching is based on the Italian tongue because of its open and frequent vowels. But the Italian omits much that is necessary for a clear pronunciation of English and the English has all that obtains in Italian. The miserable failures, as far as the clear enunciation of English goes, that we hear on the part of pupils bred entirely on Italian vocalises and arias are sufficient proof that for the well-defined pronunciation of the vernacular there is no sure basis save a painstaking and long continued study of the English itself, carefully guided by a critical teacher who is in thorough sympathy with the ideas here set forth.

IDEAS.

F. H. T.

An Ideal.

The value of an ideal has been demonstrated in the religious world by those who are trying to answer the question, "What would Jesus do?" When this question is canvassed on its various sides it resolves itself in this:—we cannot know what He would do, but we can believe that his acts would be thus and so. That creates an ideal in our minds which we can live up to with our full strength of purpose. If we reach the point where our speculation enables us to establish an ideal from which we can develop a working formula, we are already prepared to meet the perplexities of life in a manful way. The effect upon our lives can be nothing less than ennobling. We dedicate ourselves to our ideal and work out our lives from that. Whether we come up to the high standard which we set for ourselves, or whether we reach only part way, matters very little. The attempt to reach it makes us better men and women.

Anything which can arouse people from lifelessness is worth considering. The trouble with most people is that they are content to remain mediocre. If they are as good as the average man they are contented. That attitude of mind never made a great man. He who sees what the average man is and is determined to go to a higher position and to be far above the average, builds up a noble life. Everyone can rise above the present average. To do so one must form a mental picture, which is his ideal, and try constantly to raise himself to the level of that ideal. It matters little what the ideal is. This presupposes that one who deliberately planned an ideal would select one which is ennobling and not degrading. When it is once chosen, consult it constantly. Personify it, and talk to it. Ask it what and how to do. In matters which seem trivial even, consult it. Into the inquiring mind thoughts, which are good angels, will be dropped.

To return to the question of the religious enthusiasts, no one can tell what He would do. His employments and engagements are not in use to-day. He did not publish a newspaper. He did not buy and sell as we do now. He did not run a railroad, drive the presses, teach art or train the physical body. The inventions of to-day, the manner of living so different from what it was in His day, require different treatment from that of which we have record. Yet, some of the needed things can be culled from His ways. There are certain guiding principles which should control all lives. Serenity, hope, trust, uprightness, faithfulness, helpfulness and love would characterize His every hour. Whatever ideal you and I may form, and be assured that no two will select the same ideal, these characteristics will be controlling forces.

A mistake which everyone makes is to think that ideals are for everyone else, but that he has already ideals; that the preaching is for the other sinners. In matters which lead us into higher ways making us better and greater, each must act for himself. Neither can anyone take the ideal of another. He must make his own. Nor can one force his ideal upon another. He may show his pupils what ideals are and how they can use them, but the pupils must do the rest. Each must work out his own problem.

Teaching.

Teaching, whether in music or other things, is the blending of a science and art and a life. Teachers in our profession prepare the former and forget very generally the latter; they prepare technique and music, but neglect their general preparation. Technique and music are necessary for the teacher of music, but these alone will not carry students far upward. Teaching is the out-pouring of life. The very soul of the teacher goes out to those associated with him. No pupil who remains long with any teacher is ever entirely free from the influence of that teacher. He is shaped in some measure for life by the teacher's influence. This being true, and no true educator will withhold endorsement of the statement, it becomes the duty of every teacher to make his life such as should be stamped upon the youth who come under his influence. The very basis of good teaching is in good living. Teaching which makes for good must come from a life which is good. We give credit to all music teachers of having good intentions. There may be some scamps in the profession. There have been scandals among teachers. But, even admitting this, the majority of teachers are pure, strong and noble. They are actuated by noble motives. What we beg for now is that these honest people may realize that they can regulate their own lives, and that the lives which they live into their pupils is their teaching. We might formulate rules for living. We refrain. These things only will we suggest: seek beauty and beauty's thoughts; ever be buoyant, sanguine and joyful; believe in self and the contact of mind with the great All-mind.

No one knows what he is doing while he acts rightly; but of what is wrong we are always conscious.—*Goethe.*

"The best way for a man to train up a child in the way it should go, is to travel that way sometimes himself."

HEALTH AND VOICE.

S. D. EBERSOLE, M. D.

The necessity of having perfect health, for all who sing, is a matter of the most vital importance. There is no profession, business or art wherein health plays such an important part as in the acquiring and retaining of a beautiful voice.

This subject has never been given enough prominence by the voice teachers and singers of the country. Health is the product of education. It requires as much careful instruction and as thorough training in the laws and principles underlying all life as the art of singing, and should always precede and also accompany the study of voice culture. In fact, the two subjects are so closely related as to become inseparable. To retain permanent health requires the same eternal study of the subject.

It is in the perfectly healthy individual alone that the voice can possibly gain its highest perfection and thus come into its own While on the other hand, in what a pitiable condition is the vocal student who, after having taken a thorough course in the training of his voice, requiring a large outlay of time, energy and money, suddenly, to his utter despair, finds himself uncertain in carrying out his cherished hopes because of the continued liability of sickness in the form of colds, hoarseness, catarrh, nervous prostration, or lowered vitality of whatever kind. The one thing that haunts the singer like the nightmare is the fear of taking a cold. All of this trouble being largely the product of downright ignorance.

Singing is the highest expression of the Divine Nature, hence, the absolute necessity of perfect harmony in all parts of the individual. By health, we mean that which is internal harmony, more than mere soundness of muscle and bones, as one may possess ignorantly a fair degree of what is usually termed health and yet be the victim of any adverse or contagious wind that blows. Such a condition is unsatisfactory and not a condition of true health.

Health

Imrlies a knowledge of how to become immune to all outside evil influences and an abiding condition of harmony within. Health means a working knowledge of the true principles of Being. It means harmony and naturalness of all the faculties, processes, membranes and molecules of the entire system.

Mind, through the medium of conscious and unconscious thought, controls the physical body to the last atom. In truth, the body is mind crystallized. Thus the spirit and body in reality are one, and must never be considered separately. Disease is Dis-ease, that is lack of ease which is inharmony. This condition is brought about by erroneous thought and always has its origin in the mentality of the individual, all appearances to the contrary notwithstanding.

Whenever we are in a mental attitude of harmony we are generating health and beauty, for we are in a state of eternal creation and in this miniature universe we call the body, thousands of atoms spring each moment into life with their quality and arrangement determined by our thought.

We may always be in the attitude of mind that generates beauty and power if we are true philosophers, for all trouble and inharmony spring from ignorance and lack of development. One, indeed, can safely say, that health depends upon intelligence and that intelligence depends upon conscious knowledge of the truth embodied in this science. Over the ancient Delphic temple stood the inscription: Gnothi Seauton, "Know thyself."

No one is truly healthy without this knowledge and will surely, sooner or later, lose what little health he does possess, or that which he seemeth to possess, and without this knowledge he is incapacitated from growing into a permanent condition of health.

It is safe to say that ninety-nine out of every one hundred fail in this direction; it follows then that ninety-nine per cent. fail to realize their best voice, for the whole body is a

Musical Instrument,

And what adds to the beauty, health, freedom and efficiency of any part adds to the beauty, health and freedom of the voice.

The voice is produced by the entire body in harmonious action, in joyous action. All action is mind action. If it is less than this, it is not the best voice. "Psychologists say that ninety-five per cent. of our thinking is subconscious. Fully as large a proportion of our voice culture has no direct relation to vocal gymnastics, for tone, as we know, is dependent upon tension of cord or string. So in physiology, muscles must be tense to produce harmonious vibration. Realize that the larynx is only a small part of the instrument, the part which may be called the 'pitch' mechanism." And the body is to the larynx exactly what the violin box is to the strings above it Observe the least defect in this frame work of the violin and the tone quality is lost. Learn to trust this larger part of the work of voice culture. Only he who so consecrates his entire self and his acts to harmony will ever be a great singer.

The question is often asked why there are so few great singers at present. May not the ideas herein given be one reason for it.

As an evidence of the virtue of all the main features of this article, note the mental strength and magnificent physique of all the renowned singers of all generations. qualities of vitality, mental calibre, magnetism and personality which can be acquired by all, if they sufficiently desire it and are willing to pay the price in application and study.

Since the latest development in voice production by our best teachers has placed this entire subject upon a mental basis, and as voice itself is a spiritual emanation, being but the expression of immaterial thought, it is doubly necessary at this time to place this subject of health and the body on its true mental plane, and to give metaphysics a higher place in the vocal category.

Sickness, itself, being a revolution within the body, is only neglected *evolution*, which again is a mental process.

There are times and conditions when the doctor and external helps are expedient and even necessary, and yet it is the "dernier resort" always, and should not be depended upon, and with a working knowledge of fundamental principles is not necessary.

For he who looks mainly to external sources for health and power and lets his real, internal powers lie dormant and undeveloped, will surely come to a sad end, and is already in a most unenviable condition.

Even following out religiously the rules of health, diet and gymnastics that are going the rounds of the press, is not sufficient to bring about this physical redemption, a state which all can gain possession of.

The rules are all right in their place, but are really valuable only to the one who understands the principles underlying the rules, while to such an one they are no more rules, but an embodied activity and one made a part of the living self.

There is a therapeutic value in music, especially in the normal breathing and vocal exercises. Yet this is secondary or negative in its effect as compared with that of concentrated, liberated thought, based upon an understanding of the life principles, which is positive and actively regenerating.

Mental culture brings out the health and this makes better tones; such tones being given expression, reacts favorably upon the body in this its higher expression.

As an illustration of the benefits to the voice of a perfectly healthy person, take the one idea of tone resonance, that element which gives the full, large, satisfying quality to the voice. This quality is impossible in a devitalized person and finds its highest expression in the emancipated magnetic being wherein there is true at-one-ment of soul and body, love and wisdom, intuition and intellect. The reason for this is that the tone vibrations are transmitted upon the magnetism supplied by the nerves.

We take it that all interested in music desire to progress in their chosen profession. What is here written has been grown out of the experience of the writer both as a physiologist and as a vocalist. It has been verified by a sufficient number of other individuals to give it significance.

While many are experimenting with this most fascinating of all studies, the study of man or health in its relation to voice, that the large body of the musical fraternity do not pay enough attention to these vital subjects, and that they do not understand them to the point of applying the principles is painfully evident to the most casual observer.

We append a few suggestions for acquiring this

Radiant Health.

Mental laws are as definite as the laws of any other science. They have been demonstrated so many times, and are being formulated and so clearly defined, that any one who desires can easily get possession of them and demonstrate them for himself.

First, realize fully that the individual is a great magnet. This magnet attracts. There is a law governing this attraction, which is always in operation either for good or evil. Thought is the medium through which this law is made operative.

Second, look within for the *source* of all power. Desire intensely to manifest this health which you possess inherently, and know that this can express itself only through mentality. Also realize that each and every individual has at command all the faculties required to bring about these results. *Cease* looking for and depending upon outside helps, excepting for information or enlightenment.

Formulate your desires. These clearly defined desires become your ideals. Ideals through the law of attraction and of cause and effect will be externalized, providing these ideals are intelligently, confidently, and persistently held. This is concentration.

Without a strong abiding desire, and without implicit confidence, you need expect nothing in this direction. Desire is the beginning of its own fulfillment, as also it is the prophecy of what can be realized. It is the monitor which tells us what we may reasonably expect.

To put this process a little more plainly, clearly outline your desire which becomes your ideal. Water this ideal with the thoughts of wisdom, that is, analyze and study everything bearing upon this subject of health. Keep out every trace of fear, doubt, envy or temper, and close all avenues where energy is dissipated.

Now, this ideal, through the law of mental attraction —you being the great magnet—will bring together those elements that make for instance health. So that your ideal, intelligently possessed, becomes your reality fully expressed. And lo! your work is properly begun to prolong indefinitely that radiant health and also to beautify that divine faculty, the Human Voice.

Again, the processes of life and death are constantly at work in the human organism. This is a natural process, as all physiologists agree. Study to know these processes to the end, that these activities may exactly correspond. And that the process of cell building may always equal, if not to transcend the other natural process of cell destruction, and you have found one of the secrets of long life and happiness. No one can better demonstrate health than a musician, because of his free, emotional, sensitive and imaginative nature; because of his power of intense feeling. If the singer but knows himself, he will discover that the power he can command is unlimited. I hold that the musician may yet be the leader of mankind in this ethical, this redemptive process.

In conclusion, avoid too many rules, but seek to know the truth underlying the rules. Because a rule is but a reasonable deduction from one who understands a principle. The rule, as I said before, will do for the one who deduced it, but will not suffice for the one who merely follows it without studying the principle. Find the key that unlocks the great storehouse of all wisdom. Know that all power is given unto men to utilize. Get a working knowledge of this Science of Being and thus acquire a conscious power from within, which is always gratifying in its results, which can always be depended upon, and which is as permanent as eternity itself.

VOCAL AND INSTRUMENTAL MUSIC.

The difference between vocal and instrumental tone is as great as that between a natural and an artificial flower. One is produced through divine agency, the other through that of man. Even the exclusive instrumentalist should be willing to grant this superior quality to vocal tone, because in many other respects an instrument such as the violin possesses distinctive advantages over the voice. For instance, larger compass, greater sustaining power, harmonic as well as melodic capacity, and more freedom in chromatic transition. But in respect of that great musical desideratum, timbre, the instrumentalist can only hope to approximate the human larynx quality of the natural expression of a beautiful voice, such as that of Nordica, Eames, Melba, Plunket, Green, or Jean de Reszke. Indeed, the nearer an instrumental performer approaches the human organ quality the greater is his art and the higher is his fame.

The distinctive character of vocal music, properly considered, forms a style almost directly opposite to that of instrumental music. The former is essentially melodic, the latter is harmonic—which necessarily includes some form of melody. The comparison might be carried farther by saying that vocal music is lyric, while music for instruments is more properly thematic.—*A. J. Goodrich.*

THE ORGAN.

ORGAN AND CHOIR.

WM HORATIO CLARKE.

Organ Practice in Europe.

E. C.—"I have been making preparations for a two years' course of organ study in France and Germany. Will there be any difficulty in obtaining the use of organs for daily practicing?"

Answer.—You will not be able to obtain the use of church organs in either country. In France there is an inexorable rule that the church organs must not be used for lessons, and there are not many organs outside of the churches, but you may be able to hire an Alexandre, Debain or Mustel harmonium. Sometimes an organ may be found in an organ factory, standing a few days after it is finished, but that is very uncertain. You will find the same difficulty in Germany, where your only resource probably will be a pedal piano. Few organ recitals are given in Germany, and the church playing is mostly made up of choral preludes and postludes, with little variety. The best way of adding to your knowledge, after due study with the facilities afforded in this country, is to visit the cathedrals and churches in Europe and listen to the best players under the most favorable conditions. Even then you will hear no better organ playing than is given in our American cities by the best players. In England organ recitals are popular and are constantly given by highly-educated organists possessing college degrees, but the same program repertoires are given in the large cities of this country. Of course, you will hear grander musical effects in those old resonant cathedrals, associated with the romance of history, which is not possible in the United States, and in that experience will rest the principal charm.

Engaging an Organist.

O. W. W.—"Will you please inform me who appoints the organist of a religious society and who is responsible for the care of the instrument and who has the custody of it?"

Answer.—In the Church of England the legal right to appoint and dismiss the organist rests with the clergyman, who may have just as much or as little music as he pleases, and he can shut up the organ from being used, if he desires. The wardens are responsible for the care of the instrument as a part of the church furniture. The organist is simply paid to play during the services, but it is the universal custom to allow him free access to the organ for his own practice and for teaching, but the latter point should be clearly understood at the time of the engagement. To avoid conflict a written contract should be signed by both parties stating the terms of agreement.

In American churches the standing committee, annually chosen, engage the organist for the year. The organist is responsible for the care of the organ but can incur no expense for repairs or tuning without being authorized by the church committee. No other person than the organist can claim a right to use the organ, and no one can practice upon it without his consent. Even an organist visiting the church, if he desires to play the instrument to friends, should ask permission of the regular organist to use the instrument for the occasion.

In Roman Catholic churches the clergyman of the parish engages the organist and takes the responsibility of all musical expenses, the organist having no committees nor wardens to look to. For this reason, an organist, who has the favor of the minister, is more likely to retain a permanent position than in Protestant churches, and has no conflict with the annual laymen.

Obtaining a Situation.

S. M. W.—"I have been studying the organ for three years with a competent teacher who says that I am prepared to fulfil the duties of an organist. What course must I follow in order to obtain a situation?"

Answer.—With a written recommendation from your teacher you can send an application to the music committee of a church where there is an announcement of a probable vacancy, to be placed on file with other candidates, to go on trial before a selection is made. If you have personal friends in the society and your ability is recognized, their influence will count in your favor. Then, if upon trial your ability is proved to be sufficient to meet the demands, you will be likely to receive the appointment, and the duties should be specified in writing.

In England and Canada the candidate is selected by musical judges appointed by the church authorities. On a fixed trial day the musical judges take a position in the church where they cannot see the candidates, and whom they do not know beforehand, who are to perform. These candidates in turn play at sight the compositions placed before them and play extemporaneously, and show their proficiency in the management of the instrument and in accompanying voices. The one who thus best fulfils all the conditions is then impartially chosen, without probation, if his character and moral reputation are unblemished.

Swell Boxes not Air-Tight.

E. F.—"If the swell box of an organ is perfectly air-tight, how can the pipes speak if there is no escape of air from the box? Would not the compressed air change the pitch of the pipes?"

Answer.—If you will carefully read the article in the May number of THE MUSICIAN, on the Swell Section of the organ, you will see it stated that the swell box is not air-tight, because it would first change the pitch and, next, after the air was compressed so as to be of the same pressure as in the wind chest, the pipes would emit no tone. The closing of the swell folds simply shuts off the force of the vibrations, and the use of the swell pedal gives the same effect as the opening and closing the door of an adjoining room when one is listening to music issuing thence.

Organ Tuning Tools.

R. H. L.—"Can you tell me what kind of instruments I should get for tuning the pipe organ and where I could buy them? I teach music and tune pianofortes and reed organs, but have not the requisite tools for tuning large organs."

Answer.—You will find the subject of organ tuning in the June number of THE MUSICIAN. You will, doubtless, be able to procure the tuning cones and tools of the Samuel Pierce Organ Pipe Co., Reading, Mass., who furnish all materials used in the construction of pipe organs.

A Discouraged Amateur.

A. G. W.—"I have patiently been making a small organ of four stops, the pipes all of wood, and in voicing them I have become quite discouraged because I cannot get an even quality of tone. I have tried to make them according to a graduated scale. Some of the pipes will give a full tone while others will be stifled and speak the fifth or octave with entirely different quality of tone from the others. There is certainly a secret in voicing organ pipes which I have been unable to solve. I wished to have the pleasure of knowing that I had made every part of this instrument myself, but fear I shall have to give up the finishing of a work on which I have spent the spare time of years. Can you help me in this emergency?"

Answer—The art of voicing organ pipes cannot be imparted in writing. There is but one way in which you could be aided in carrying out your idea of doing the work with your own hands, as follows: If your pipes could be carefully boxed, with new duplicates of those which you have spoiled and sent to me and you also spend a week or two here, you would be shown how to voice your pipes satisfactorily, and you could return with them all voiced by yourself. You would have to carefully note the wind pressure of your bellows, and the pipes could be at once placed upon the voicer in my music room, which was made for my own study of voicing in former years. If this cannot be done you had better purchase your pipes and have them sent to you voiced. You would have to send your scales also. You are doubtless of a musical nature, otherwise you would not have attempted to build a small organ. If you are not musical you had better not touch the voicing of a pipe. If you have new stops made and voiced for you it would be wise to have two of them made of metal—an Open Diapason and a Dulciana—and have the other two a St. Diapason and 4 ft. Flute.

Portable Pipe Organs.

J. M.—"When I was a boy I remember seeing a small pipe organ entirely cased like a large reed organ and on castors, with a German name on the front. Are there any such portable pipe organs now made, and if so, where can they be obtained? Your description of a Choral Organ in the April number of THE MUSICIAN doubtless interested many readers who would like to learn more concerning small pipe organs."

Answer.—Some thirty years since there was a firm named Derrick and Felgemaker, which made portable pipe organs in Buffalo, afterwards moving to Erie, Pa. These small organs contained an Open Diapason and Dulciana, running down to Tenor F, the bass being continued as a St. Diapason to CC. The pipes were firmly fastened, the metal pipes having a spur soldered on the side, which was screwed to a rack, and the wood basses were also firmly screwed to a framework, so that in shipment nothing would get out of place, and when the instrument was taken out of the packing case it was in readiness for use. There were two blow pedals and a swell lever, an octave coupler and, when desired, an independent set of pedals, coupling to the manual.

These instruments were unsatisfactory on account of the limited compass and lack of tone variety. The pipes being confined in such a small space when enclosed in the swell lacked resonance and the tone was much stifled. This style of instrument was so unsatisfactory and the demand was so small that their manufacture was discontinued.

Other organ builders have attempted to put upon the market a commercial portable pipe organ but have not succeeded, because in the attempt to crowd pipes into such limited space, with bellows inadequate to furnish sufficient wind supply, their efforts have not met with success. In order to prove if this could be accomplished, I once made a practical study of this subject and invested in several instruments which were constructed from plans which I furnished, in which the metal pipes ran down to Tenor C, with wood basses to CC. The musical result was a failure for reasons above stated. The Choral Organ, described in the April number, would not be a failure, because ample room is provided to avoid the faults incident to limited dimensions.

There is manufactured in London, Eng., what is termed the "Positive Organ," which is made in two styles, viz.: the "Ecclesiastical Model." The compass of the former is from FF, four octaves of 49 keys, without swell. It has 8 ft. Open Diapason, 8 ft. Salicional, 8 ft. Gedeckt Treble and Bass, 4 ft. Dulcet Treble and Bass and a 16 ft. Bourdon Bass. There is a mechanical register called the "Melophone," which plays only the upper note of the Open Diapason when a chord is played, so that when the other stops are drawn also the melody is brought into prominence, differing from the effect of the melody octave coupler described in the Choral Organ, which affects all the stops. The Bourdon Bass plays only the lowest note of the harmony and differs from the sub-coupler of the Choral Organ which, in addition to playing the lowest note of a chord with the Bourdon Bass, plays the lowest note of a chord an octave lower, of each stop and thus gives a more effective bass.

The Positive Organ also has a transposing keyboard to the extent of a third below and a half step above the prevailing pitch. The instrument is delivered in two packing cases, one containing the body of the organ and the other the pipes, which may be placed in position from the directions given, but which will require tuning after handling. It will then remain in tune because there are no reed pipes to become deranged or to get out of tune. The Ecclesiastical Model when put together is 5 ft. 2 inches wide; 3 ft. 2 inches deep; 7 ft. 6 inches high, and weighs, unboxed, 700 pounds; boxed for shipment, 1,150 pounds.

The "Organist's Model" has the same specification with the compass of the keys, from CC to A^3, 58 notes, and an independent set of pedal keys of 30 notes, which play the 16 ft. Bourdon. The blow pedals are omitted and a hand lever for blowing is attached. This instrument, when set up, is 6 ft. 10

inches wide; 5 ft. 6 in. deep and 10 ft. high, the pipes being enclosed in a swell. This is the nearest approach to a portable pipe organ which can be found in the musical instrument market in stock, whereas the Choral Organ would have to be made to order. The instruments are fitted with castors, so that they can be rolled into any part of a room.

The Positive Organ can now be obtained in this country under the name of the "Hymnolia," Messrs. Chickering and Sons, the pianoforte manufacturers, of Boston, being the distributors for North and South America, who control the sales and prices.

The "Hymnolia," according to its capacity of giving the pipe tone from real organ pipes which are not sensitive to every change of temperature, is well adapted for an accompanying instrument for small churches, chapels, choir practice rooms and lodges, but no more power must be expected from it than the corresponding stops in a large pipe organ would produce, and one may readily ascertain this by hearing the same stops played in a church and thus have a practical illustration of the power. For body of tone in accompanying voices they are certainly superior to any reed organ, and they are being introduced into wealthy homes, with specially designed art cases, for use in combination with the pianoforte, as beautiful effects may be produced by the union of the two qualities of tone when tuned together, using musical compositions which may be obtained for this purpose. Yet it should be understood that a two-manual organ is much superior to an instrument of such a limited capacity, it only being alluded to here in answer to inquiries concerning small pipe organs which do not require the services of a professional organist.

Tubular Action.

A. L.—"What is tubular pneumatic action, and how does it differ from the usual pneumatic action?"

Answer.—Tubular pneumatic action is a name given to the ordinary pneumatic action where small tubes are used to convey the wind from a set of small valves, placed near the keyboard, to the pneumatic bellows valves, instead of the usual tracker action. The tubes are the size of small gas-pipe tubing and are made of a thin, soft metal composition, which will readily bend. It enables the builder to locate the keyboard desk, or console, in any position with the least mechanical complication, so that if a pillar or a portion of a wall intervenes between the player and the pipes, the tubes may be carried around the obstacle. It is most frequently employed for actuating front display pipes, instead of the old method of conveying the wind from the chests through mitred zinc conductors.

A Horizontal Organ.

S. P. T.—"Could not a small pipe organ of two or three stops be made in the form of grand piano, with the pipes placed horizontally, the space beneath to be used for bellows of ample capacity?"

Answer.—Yes, but it would not be satisfactory unless the top should be much higher than a grand piano, because the space with an attachment for a swell would be too confined. Many years ago an attempt was made to introduce a portable pipe organ made in this form, but it was not successful.

The Legato Touch.

M. G. W.—"In teaching the legato touch to my pianoforte pupils I find it very helpful to let them play andante movements upon a reed organ which I use in my studio for that special purpose. I find it the quickest way of illustrating to them the necessity of holding the keys down the full length of the note, especially with the interior parts. Is this method considered proper and artistic?"

Answer.—It is one of the best methods of convincing pupils of their defects in not holding the keys the proper length of the notes. The pianoforte only gives a framework of music which the imagination fills out in form, because the percussion tone begins to die away immediately. With the organ the tone duration is absolute as long as the key is held, and a reed organ is an excellent adjunct in the study of piano music. It is an excellent instrument on which to practice finger exercises without producing sound, the monotony of which is quite disturbing to those within hearing range.

Cheap Church Music.

N. H.—"I am employed as a salesman in a city department store and reside in a suburban town where I am interested in church music. I have no instrument in the house, but have been offered the use of our church organ for practice if I would accept the position of organist. I can read vocal music and can pick out the music of gospel hymns upon a piano without having instruction or understanding fingering. The organ in the church has two rows of keys and foot keys for the bass. They expect me to play without salary for the privilege of using the instrument. Ought I to accept the position and work up my music for Sunday during the week, or wait until I have taken a preparatory course of instruction by having a cabinet organ in my home? I can get the use of one from a neighbor. A few words of advice will be gratefully received, as I have never played an organ, and do not want to make a mistake in assuming to do what I know I am not yet competent to do?"

Answer.—Don't, for the sake of art, think of taking such a position until you are fully prepared to be a representative organist. The musical managers of such a church must be of a very poor grade to make such a proposition. Prepare yourself as soon as you can to raise the standard, and in the meantime use your efforts to install some one who knows how to play an organ and who will receive remuneration.

No Organist in Town.

K M.—"I have studied and taught the piano for a number of years and can read music at sight well. There is no regular organist in the church where I attend, although there is a good-sized instrument which we seldom hear played by an organist. The committee have asked me to take the position and do the best I can, so that they can have a regular player to depend upon. I have no idea of the management of an organ and, before giving an answer, I would like to know what the difference is in the touch of the organ keys as compared with the piano and in the style of the music? What should I need to study as a preparation?"

Answer.—It would be a good plan to have a reed organ in your home, if you could rent one for a few months, so that you could cultivate a true legato touch in which finger substitution is much used instead of the piano percussion touch. If a smooth legato touch is attained you will succeed in organ playing; if united with it you understand harmony so that you can improvise short preludes and interludes and the art of modulation and transposition. Write the publishers of The Musician to send you the best instruction book for the pipe organ and a few books of easy voluntaries. The pianoforte gives a non sustaining tone, and the chords are detached and broken, with much skipping of the left hand, while organ music consists of smooth part playing, in which each voice or part has its individuality of construction and resolution more complete and distinct than in piano music.

A Salary for Noise.

A C. L.—"I have received the appointment as organist of the Methodist Church, in this city, and the organ has eight stops in each of the manuals and two pedal stops. The Gt. Trumpet and Sw. Oboe are always so much out of order that they cannot be used without making a horrific effect, but the church people think that they don't get their money's worth unless they hear the full organ all the time, as noise counts for more than art, while my own taste inclines toward delicate and expressive combinations. Our city has a population of 22,000. We have no good organists and the salaries are very insignificant. There are no organ teachers here, and I shall be grateful for any help which you can give in The Musician in regard to studies and the selection of music which will aid in cultivating the taste of our church people."

Answer.—In drawing stops make it a rule never to use one while it is out of tune. Educate the tastes of your people by giving them selections of good organ music. Write the publishers of The Musician to send you a varied assortment of good organ music from which you can select, according to your taste, and return what you do not find desirable. You need not play either fugues or marches, but melodic and harmonic compositions, which are pleasing. Do not march the people out of church nor give them any more "noise" than they pay for. For studies you will find help in "The Organ Tutor," "Organ Studies," "Complete Pedal Scales" and "Complete Pedal Arpeggios," costing about 75c. each, published by Hammond & Co., London, Eng., which may be obtained of the Hatch Music Company.

A Finical Church Committee.

F. L. G.—"I have been organist and director of music in the church for eight years, where I am now engaged, and I have had a pleasant position until this year. I have worked for the interests of the church in every way to render my services valuable. This year a new committee was elected, not one of whom has a musical idea or knowledge of a note, but each member is extremely officious and they are doing everything to balk my efforts and to render the situation uncomfortable. They have taken the choir management into their own hands and refuse to allow me to invite any new members to keep up the decreasing numbers. One week one branch will visit me to reproach me with taking no interest in the music and charge me with laxity in my drill and of the pusillanimous selections I furnish, and the next week the other branch will accuse me of drilling the choir too severely and that my selections are of too high a grade. They have requested that the anthems be short, have stopped all interludes and also the organ postlude, saying that it disturbs the talking of the congregation when the services are over. I have tried to be patient and uncomplaining, but the position grows more exasperating each week. What can I do?"

Answer.—When a committee shows such opposition it is a clear sign that your resignation will be gladly accepted, as they doubtless wish the position for some friend or relative, and they have not the courage to ask your retirement, because there is no real reason from any inefficiency on your part. If they can stir you up so that you will make some unguarded expression, they will accuse you of insulting language and then dismiss you for it. Their next move will probably be to lower the salary with the excuse of retrenching the expenses of the society as a subterfuge. Such underhanded committees are sometimes pacified by a commission deducted from the salary, if it is large enough to warrant it. But no true organist would be guilty of such bribery. Such a dishonorable committee is exceptional, but once in a while the management of church affairs falls into such hands. The annual change of officers in a religious society is one of the unfortunate conditions existing in American churches, because it causes an organist's position to be uncertain, as well as that of a professional singer. In advising you what to do under the circumstances you mention, it would be a wise plan to quietly secure another position, and patiently bear the adverse surroundings before resigning without giving any expression to your feelings. It is not well to resign any situation simply because of obstacles which must be met without having another at hand, because it is more difficult to obtain a position when one is out of professional employment. It is a good rule never to give up any position voluntarily until another is ready to be filled. When one is dismissed on account of a change of management, the best must be made of the circumstances, without being discouraged. The most talented and worthy often pass through such experiences, for a musician's life is only an ideal one in theory while in this disciplinary era of existence.

Short Service Prelude No. 4.

The theme of this prelude is of the simplest order of construction. It does not call for many changes in registration, as the variety is found in the harmonic mutations. The first eight measures are played on the II manual with the Open Diapason, St. Diapason, Salicional and 4 ft. Flute Harmonique. The manual and pedals play the bass, its II manual being coupled to the pedals. The next section of eight measures is taken upon the I manual, with the Open Diapason and Melodia, the II manual being coupled and the 16 ft. Pedal Open Diapason being added. In the rest at the end of this section the I Open Diapason is taken off in readiness for the introduction of the Melodia in the right hand and the Pedal Open Diapason is also then shut off. The next section enters by a sudden transition to the key of A♭, the theme being taken by the manual bass for two measures, without pedals, and answered in the treble when there is a modulation into the key of D♭, the right hand playing from manual I for four measures, when both hands play from II manual, and the prelude closes with an augmentation of the first theme. In taking off the Sw. Open Diapason and Flute in the twenty-eighth measure care must be exercised that it shall be done between the third and fourth beats, so that the change will not be apparent to a listener, and also in the thirty-fourth measure, where the St. Diapason is to be taken off between the first and second beats, leaving the close with the Salicional. The piece may also be studied with the changes of the hands, as indicated in the directions given, concerning the first Prelude in the May number.

Vested Choirs.

R. C. G.—"Can you tell me why vested choirs are now being introduced into other churches than the Episcopal?"

Answer.—The conventional order of church services in all denominations consists of traditional observances, handed down as relics of the ages when the masses of the people could not read or write or think for themselves, but received their religious instruction by means of the pulpit, the support of which was the chief religious duty. Ancient doctrines are now so modified that the voice from the pulpit has not the authority of former years, and gradually more external attractions are being introduced as adjuncts in public worship. In many city churches it is customary to devote the Sunday evening services to the rendering of selections from oratorios, or short oratorios and sacred cantatas entire, with appropriate organ selections, interposed with brief remarks from the pulpit, which relieves the service from the name of a sacred concert. The music in the more formal morning service is often advertised also, because the doctrines proclaimed do not influence the people, as in former generations, and thus music is exerting its power for good to a wider extent and is leading to an increased interest in choir work.

For this reason it is thought that a vested choir of women and men will give greater dignity in public worship, as well as reverence on the part of the singers for the service in thus clothing them with the vestments of purity and holiness, and prevent the individual display manifested in a concert which this uniformity of apparel precludes. It will result in drawing a distinct line between devotional and secular music and thus it is to be commended. The vestment being adopted is precisely the same as worn by Episcopal choirs.

An Inopportune Suggestion.

H. C. W.—"I recently had an unpleasant experience at a musical service which has discouraged me in my attempts to build up an effective chorus choir. For several months I had been having an extra rehearsal, with an augmented choir, upon oratorio choruses with appropriate solos in preparation for an elaborate Sunday evening musical service with a chorus choir in the organ gallery back of the pulpit, and a choir of one hundred children in the opposite gallery at the other end of the large church for choral and antiphonal music. Just as the choir was about to enter the church from the vestry some one asked me if I did not think it would be a good plan for the ladies to remove their bonnets or hats on this occasion? I, at once, said "Yes," because I thought it would give them more freedom in singing. Not waiting to see the results, I at once hastened to the organ to play the prelude to the service. When I had finished and the introductory chorus was to be sung, I was deeply mortified to find that more than half of the sopranos and altos had refused to sing and had taken their seats with the audience, being offended with the suggestion which had been made as a command from me to remove their head-dresses! Thus was defeated the labor of months, although the service was given in this unbalanced condition. I tendered my resignation at once, which was not accepted, but my ideal was almost crushed, and it will be a long time before I attempt to give another musical service. Was I to blame?"

Answer.—Your experience was certainly very unfortunate after so much work in the preparation for your musical service, but do not let it dishearten you nor keep you from further efforts. The suggestion was exceedingly inopportune on the part of the person who made it, when both you and the singers were excited with the responsibilities of the occasion, and do not reproach the delinquent sopranos and altos. If you had been given time for reflection at the moment you would immediately have said, "No! not at this late hour," and nothing would have occurred to cause ill-feeling. Had it been understood beforehand, by mutual agreement, the ladies would gladly have assented and would have come prepared to remove their bonnets or hats. Do not judge them harshly. Ladies are very sensitive about appearing before a thousand people in a conspicuous position. They give much preparation to their head-dress when in a drawing-room reception and the sudden order to dispense with their bonnets found them unprepared, and, of course, they were offended and refused to thus exhibit themselves. They had no ill-will toward you and felt as much grieved as yourself over the result. It will be well for you to see each individual and kindly explain the matter without blaming them and you will unite your choir. It was not a lack of appreciation of your work, but an act of self-protection on their part, the way human nature is constituted. Put yourself in their place in thinking it over and imagine how disappointed they were also after voluntarily spending so much time in rehearsing. Those who sang under the circumstances were truly loyal to you and the art and were willing to sacrifice their own feelings. Such a mistake will never again occur in your experience.

Great Expectations.

M. G. B.—"I have relinquished a good musical position and accepted another in a wealthy Baptist church as organist and director with a large salary and the promise of a new organ. I find myself surrounded with difficulties hard to solve and everything fresh, excepting an old wind-mill of an organ. The fine quartet choir has been abolished and the young people have formed themselves into a chorus choir. The chairman of the committee is the senior deacon, who remarked to me, after I was engaged: 'We have had irreligious fiddle-daddle music long enough, and now we want straight Baptist sacred music. Our recent choir was made up of a Roman Catholic, a Jew, a Unitarian, a Free Thinker and a Nothingarian—professional people who were utterly unfit to furnish music in the house of God. Now we are to have a real Baptist choir, all of them church members, whose influence will be for the interests of the church, and we have great expectations from the new management under your direction.' These were the introductory remarks concerning my work.

"Now it proves to be a fact that the new choir is made up more of active church workers than in regard to musical efficiency, a number of whom cannot read music and only sing by rote. Furthermore, there are so many meetings held during the week that the only time allowed for a choir rehearsal in preparation for two services on Sunday is at the close of the regular weekly prayer-meeting, when all are anxious to hurry through and get home, and it is utterly impossible for me to prepare any anthems under such adverse conditions. In addition to this, the minister has intimated to me that I am also expected to be present at the weekly meetings and not only take charge of the music, but speak on religious subjects and influence others to join the church. I am told that they expect me to build up the choir in this way. I have already consented to take charge of the music in the Sunday-school, but as to becoming a revivalist or evangelist I must be excused, as my musical education did not include that preparation. I have my own principles of religious conduct in which I do not care to pose. I cannot put on a sanctimonious hypocrisy for the sake of a salary, nor can I furnish music in keeping with my past reputation as a director. I have written at length for advice, because I cannot see how I am to accomplish what is expected of me. If you will kindly offer a few suggestions I will be truly thankful."

Answer.—What seem hardships to us at the time of experiencing them often prove fortunate openings for the development of latent talent, the exercise of tact and the victorious surmounting of difficulties which make our lives more useful. If you have a large salary you will have to earn your money, even if you have to try to "make bricks without straw." This will draw out your inventive genius and make your musical services more valuable in future years. A genial, accommodating spirit, united with executive ability, will accomplish much in any work. In musical matters try not to disappoint their expectations, because it is a compliment to your reputation in your being hired to carry out the ideas of the committee appointed to negotiate with you. If they want straight sacred music let them have it straight, and the straightest kind of devotional music is good congregational singing, led by a full chorus choir. Here is where your work will begin and you have a fine opening. Set out to have the best congregational singing that has ever been produced. Put your enthusiasm into it and inspire them all. Win their hearts and stir them to it. Make personal friends with each of your choir. Never lament to any of them your lack of a rehearsal evening. That will come all right when they become interested. Taking charge of the music in the weekly meetings and Sunday-school places the whole music in your hands so that you can hold up a standard. Fill out the music of the service with more congregational hymns and get everyone to sing with spirit and heartiness.

In regard to religious opinions, keep your own counsel and live up to what you know is true and there will be no conflict. Never attack doctrines which you do not like or make comments thereon. If you are asked to speak in the meetings tell them that you prefer to sing religion rather than talk it, and show them that you mean what you say and they will believe in you.

If you can work earnestly and patiently one year you will be able to gather a good choir around you, with everyone interested in your efforts, because of the results in which all have participated. Having established good congregational singing, you will be engaged for another year with no reduction in your salary, the congregational singing will keep its standard and a choir will be formed who will devote the proper time for rehearsals and you will fulfil the expectations.

Changing the Words of Anthems.

J. W.—"As organist and director of music in a Unitarian church I find it quite difficult to select music with words suitable for our service. Many of the grand Te Deums and anthems I cannot use because they inculcate religious doctrines which our people do not tolerate. Can you recommend pieces which have words for the Unitarian service?"

Answer.—When you find an anthem or selection with unsatisfactory words you can write in words which you can substitute for those printed with the music. This is customary with choir leaders who seek to have all the sentiments expressed in harmony with the theological teachings of the church in which they are employed. This will give you a complete range through all the best sacred music. Some Te Deums are published with words underneath those which are conventionally used. In many places one or two words are indicated in which a change is needed. Even in the modern Jewish service many of the popular Te Deums of the Christian Church are used, as well as other selections, with a few words changed. Thus, much of the old standard music, which is allied to sentiments which are now obsolete to progressive minds, may be revived and associated with the new thought which has dispelled irrational ideas of religious truth. In this way it will not be necessary to suggest any special pieces to meet your requirements.

Drilling a Chorus Choir.

J. M. W.—"I have recently taken a position of organist and director where there is a chorus choir. A number of the singers are poor music readers but have good voices. To reorganize the choir and leave them out would give great offence to themselves and their friends in the church. I find it very difficult to prepare the music satisfactorily for the services. Can you give me any advice in regard to the best way to drill such a choir and obtain better results?"

Answer.—It would be a good method to plan out your rehearsal work and service programs two or three months ahead. Divide your time at the rehearsals into three parts. During the first part drill on the music for the coming Sunday. In the second part take up the music for the next following Sunday, and then begin upon the anthems for the third Sunday. Do not have too long anthems or pieces beyond the capacities of the singers to execute well. Review occasionally those which have been sung and which have been liked. No fault will be found if a good anthem is repeated once in three months. When a rainy Sunday occurs with its usually depleted choir use music which is familiar to the singers.

Nearly every chorus choir has singers who cannot read music at sight, but who easily commit their parts to memory in looking at the notes with proper drilling. In learning a new anthem take each section separately with each part alone. Then put the four parts together on that section so that each singer will become interested. Then take up the next section of eight or sixteen measures in the same way and thus proceed with each section until the composition is completed. Then rehearse it as a whole until all are familiar with it.

In drilling with a separate part, play that part alone upon the instrument and sing it also at the same time with the other singers, so that those who do not easily read the music will learn the notes by sound and association.

It is a difficult position to fill in assuming the responsibility of furnishing good music under such conditions, where a leader has to take an old choir without the privilege of reorganizing the membership upon a sound musical basis.

IN THE MUSICAL WORLD

AMONG OUR SCHOOLS AND TEACHERS.

Pupils of Wm. H Pontius were heard in a song recital June 21.

A concert by pupils of the Academy of Music, of Red Bank, N. J., was given June 18.

The Toledo (Ohio) Conservatory of Music gave a Soiree Musicale, June 28, at which a well selected and arranged program was giveu.

Pupils of Miss Ada Koehler, Rochester, N. Y., gave a piano recital on June 25, at which the program showed thorough training.

The Detroit Institute of Music, Miss Kate H. Jacobs, director, gave a pupils' concert on June 14. The pupi's were assisted by a fiue orchestra.

Pupils of E R. McGlashan, of Detroit, Mich., gave a recital of American compositions on July 2. This is in keeping with the present tendency to honor our own.

The fifth annual commencement of the Cortland, N. Y., Conservatory of Music was held June 25-28. Six concerts were given, which evidenced the careful work of the year in all departments.

Pupils of Mr. Manley A. Bowman, of Jamestown, N. Y., gave a recital of compositions by Rummel, Duvernoy, Weiss, Behr, Nunberg and others, which showed their development during the year.

The Denver Choral Union, Samuel H. Blakeslee, conductor, gave the third concert of its second season on June 11. The soloists were Miss Musser, soprano; Mrs. Whiteman, contralto; Mr. Van Dahlen, tenor, and Mr. Crampton, bass. The oratorio of "Elijah" was sung.

A Song Recital by Miss Genevieve Wheat, contralto, and Mr. Marion B. Green, bas o, at Dubuque, Iowa, was given Tuesday Evening, June 18. These artists were assisted by Miss Hortense Pontius, violinist; Mrs. W. H. Pontius, accompanist. The program was very attractive.

The Olivet College (Mich.) Conservatory of Music continues to do things that are eminently praiseworthy. A song recital by Miss Ethel Farr, a concert by pupils and a rresentatiou of the oratorio "St. Paul," were the eveuts of June. The local press speaks highly of the work done.

At the commencement of the Wabash College, the glee elub gave a concert, assisted by Mary Reck Thomson, vocalist; Miss Caroline A. Schlemmer and Mr. Frank L. Reed, pianists and Mr. G. A. Eldredge, impersonator. The program was of a popular order, well calculated to please.

The annual orphan's festival of LeFevere Institute, was given at the Academy of Music Tuesday evening. The program was especially well arranged, the musical and vocal numbers being interspersed pleasantly with little sketches in which trim dairy maids and paper helmeted soldiers took part.

The forty-sixth commencement of the Alabama Conference Female College brought out the pupils of the music department in a series of excellent concerts. The work of the department is progressing admirably and the future promises to be productive of much good to the cause of music in the State.

The Iowa Society of Music Teachers has issued an offic'al organ called "The Iowa Musician." The first number is a clarion call for a rally around the standard of the society, a call which those of us who know the courteous action of the society at the time of the M. T. N. A. meeting at Des Moines, will heartily endorse.

Mr. Henry W. Goodwin, an artist of much reputation and large following in Louisville, Ky., directed a program for his pupil, Harry Eugene Dibbles, at New Leiderkrantz Hall, on the evening of June 3. It was a brilliant success in every way, and the large and enthusiastic audience showed untiring interest throughout the evening.

An interesting, aud to our knowledge, a new feature in a wedding occasion was a recital by pupils of the bride at the wedding reception. The pupils of Miss M. E. Oliua Rendell gave an exeellent program at the reception, after the marriage, to Mr. Amos Payne, at Worcester, Mass., on June 26. We judge the pupils played con amore.

Mr. J. Stuyvesant Kinslow, a new pupil of Madame Zilpha Barnes Wood, of Cincinnati, Ohio, gave a song recital the other evening which was a decided success, and called forth the praises of those who were present. He responded to several encores. His vocalization seemed to be rendered without the least apparent effort, and his audience was wild with enthusiasm. It is safe to state that the young man has a brilliant futnre before him.

The Misses Edna La Porte, Thirza Brown and O'Brian, Mrs. Frank Blum, Messrs. J. P. Morgan, Walter Crebs and Walter Makley, pupils of Wilmer D. Lewis, of the Dayton, Ohio, Conservatory of Music, gave a very enjoyable song recital re.ently. The program follows: "Oh, Divine Redeemer," Gonnod; "La Poima Vera," Straus; "La Parlate d'avor," Faust; "He was a Prince," Lynes; "Dio Possente," Faust; "Salve Dimora," Faust.

The following program was played by graduates of the School of Music of the University of Denver, June 11: Weber-Liszt, Slumber Song; Hahn, Were My Song with Wings Provided; Benza, A May Morning; Weber, Concert Stu ck; Donnizetti, O Mio Fernando from "La Favorita;" Mendelssohn, Capriccio Brillante; Lachner, (with violin obliga'o) Thou Everywhere; Weber-Liszt, Polonaise Brillante; Proch, Air and Variations; Liszt-Verdi, Rigoletto-Fantasie.

A Pupils' Musical Evening was given at the Olean, N.Y., School of Music, on June 17, under the direction of Mr Jarcslaw de Zielinski. After the pupils program, Mr. Zielinski, assisted by Mrs. W. L. Binney, piano, and Austin J. Wright, violin, played the following numbers: Morris Dance, for four hands, Edward German; Air for the G string, Bach-Wilhelm; Shepherd's Dance, Torch Dance, for four hands, Edward German; Fantasia Brillante on Guillaume Tell, Beriot and Osborne.

At the Conservatory of Music of Waynesburg College, Waynesburg, Pa., J. M. Blose, Mus. Doc., director, a senior piano recital was given Friday, June 14. The program was as follows: Sonata, Beethoven, Op. 14, No. 1; Allegro, Allegr tto, Rondo Allegro commodo, Miss Minnie Maud MacGara; Ave Maria (song), Mascagni, Miss Jessie Smith; Sonata Beethoven, Op. 2, No. 1; Allegro, Adagio, Muuetto Allegretto, Prestissimo, Miss B lle Carpenter; The Spanish Gipsy (song), Michael Watson, Miss Nora Summersgill; Venezia Gondoleria, Franz Liszt, Nocturne, Louis Brassin, Op. 17, Miss MacGara; A Dream of Paradise (song), Hamilton Gray, Miss Jessie Ferrel; Violin Obligato by Karl Blose; A L'Hongroise, Xaver Scharwenka, Hexentanz (Witches Dance), E. A. MacDowell, Op. 17, Miss Carpenter. Graduates: Miss Minnie Maud MacGara, Punxsutawney, Pa.; Miss Belle Carpenter, Rutan, Pa. Assistants: Miss Jessie Ferrel, Class of 1900; Miss Nora Summersgill, Miss Jessie Smith.

On June 10 the Professioual League of St. Paul sent out a call for a meeting to be held at Raudenbush Hall, St. Paul, Minn., on Thursday, June 27, 1901, for the purpose of organizing a State Music Teachers' Association. The preliminary meeting at 11 A. M. was called to order by E. C. Murdock, president of the professional League. C. A. Marshall, of Minueapolis, was chosen temporary chairman, and Arthur O. Bergh, of St. Paul, secretary. A committee was appointed to draft a constitution and to nominate officers for the ensuing year. The following officers were elected and the first annual meeting will be held at St. Paul: President, Clarence A. Marshall, Minneapolis; First Vice-President, Chas. A. Fisher, St. Paul; Secretary-Treasurer, Miss Jennie Pinch, St. Paul; Auditor, W. A. Wheaton, St. Paul. Program Committee, Gerard Touning, Duluth; Emil Ober-Hoffer, Minueapolis; Carl Heilmaier, St. Paul. To become an active member one must have been a resident of the state one year, and must be a professional teacher of voice culture, pianoforte, organ, or any one of the legitimate instruments of an orche tra, or any subject pertaining to the theory of mr sic. Active members shall pay an annual fee of $2.00.

AT HOME.

James Heuniker, it is said, is writing a "Life of Beethoven."

Mme. Schumann-Heinck was the soloist at the final concert of the Philadelphia Mendelssohn Club.

Mr. Joseph Hofmann will be the solo performer at the first concert of the Philharmonic Society on November 16.

Saturday, June 1, was celebrated by the New England Conservatory as Founder's Day. Dr. Eben Tourjee, born in 1834, founded the institution in 1867.

Mr. William H. Sherwood assumes entire charge of the Sherwood Music School. V luable additions to the already emiuent faculty will be announced.

Prof. H. W. Parker will be absent for a year from Yale University. During that time Edgar Stillman Kelley will be at the head of the music department.

The weekly calendar of the Second Avenue Presbyterian Church, of Detroit, presents very interesting serviees for a recent Sunday. E. R. McGlashau is organist and choir director.

Ednard Zeldenrust, the Dutch pianist, will arrive in America in November. He is said to be German in school and sentiment. In Paris, where he has resided for many years, he is regarded as one of the few great pianists of the world.

Carl Lanser, a musician, climbed to the top of the tower of the new steel bridge aeross the East river. While a large crowd of workmeu looked on he played a number of patriotic selections on the violin at the top of the steel structure.

Boston Symphony Orchestra.—The Boston Symphony Orchestra concert's New York dates at Carnegie Hall for next season are: Thursday evenings, November 7, December 12, January 16, February 20 and March 20; saturday afternoons, November 9, December 14, January 11.

Harold Baner has been engaged for an American season beginning January 2. He will make his first appearauee with the Boston Symphony Orchestra in Boston, and will play with the same orchestra in New York, Philadelphia, Brooklyn, together with a large number of recitals throughout the couutry.

Daniel Frohman, the manager of important theatrical enterprises, has engaged the young violinist Kubelik, for an American tour next season, guarauteeing him $100,000 as his (Kubelik's) share of the profits. This would signify an average of about $3,-500 receipts per concert in order to ensure financial certainty.

The Guild of American Organists at its fifth annual meeting was addressed by Canon Knowles, who spoke of the connection of music and religion, and said the true musician must be not only an artist but an upright man of affairs. He hoped to see the organist hold in the church a relation only second to that of the pastor.

This week a special dispatch to the Chicago *Inter-Ocean* states that Spencer Drake, a poor musician in La Salle, Ill., has just fallen heir to $3,000,000. Here surely, is an opportunity for Western musical journals to publish eloquent editorials on the topic of "Music and Wealth." Many questions may arise. Here is one already: "Will the rich Mr. Drake play any better than did the poor Mr. Drake?"

Rafael Joseffy, accompanied by Mrs. Joseffy, returned from Budapest last Wednesday on the Deutschland The great piano virtuoso went to Hungary to look after his personal interests, his mother having left him sole heir to a generous estate. Mr. Joseffy's plans are not yet formulated for the coming season, either for teaching or playing, but in all probability he will be heard in public before the Winter has passed.

A chorus of more than 1,000 voices and an orchestra numbering about 100 persons, will take part in a musical festival to be given in Toronto during October, in honor of the visit of the Duke and Duchess of Cornwall and York. The legislation and reception committee of the city council has voted in favor of donating $1,500 toward the promotion of the festival, and rehearsals will begin at once, F. H. Torrington having been appointed musical director.

A unique music convention was held at Lyndonville, Vt., May 21 to 24. Its purpose was to give band and orchestra players throughout northern New England opportunity to practice and acquire new ideas under the instruction of famous directors. About sixty musicians, representing Vermont, New Hampshire, and Quebec, were present at the opening session. Bowen R. Church, bandmaster, of Providence, R. I., acted as conductor during the convention, which continued for four days. Features of the meetings were cornet solos by Mr. Church, and a grand instrumental concert closing the sessions.

Three prizes, of five hundred dollars each, from the fund established by Paderewski, were offered for compositions to be submitted not later than May 1, 1901. Sixty-eight compositions are now in the hands of the judges. There are thirty-one orchestral works, nine choral works, and twenty-eight pieces of chamber music. In the first-class are seven symphonies, four symphonic poems, and eight overtures; in the third, six string quartettes and four quintettes for pianoforte and strings. Mr. Paderewski appointed the following men as judges for the first competition: William Gericke, B. J. Lang, Carl Zerrahn, and W. F. Apthorp, of Boston; H. E. Krehbiel, W. J. Henderson, and H. T. Finck, of New York, and Samuel Sanford, of New Haven.

Emil Paur, with his symphony orchestra, will make an extended tour the coming season. The larger cities of the West, Southwest and Northwest will have the opportunity of hearing a strong orchestra conducted by a man who stands to-day in New York and the East where few other men of music have stood. Emil Paur is the only conductor America has ever had who has held the three great positions, namely: Conductor of German opera in the Metropolitan opera of New York, conductor of the Boston Symphony Orchestra and, subsequently, of the New York Philharmonic Society. Theodore Thomas was conductor of the Philharmonic and now is at the head of the Chicago Orchestra, while the late Anton Seidl had both the Philharmonic and the German opera. Mr. Paur's work the past four years, since he came to New York at the close of his live years' work as conductor of the Boston Symphony Orchestra, has steadily grown in its influence and has shown results which four years ago would have been thought impossible, especially under the existing unfavorable circumstances for the growth of orchestral music in New York.

A handsome testimonial was presented to B. J. Lang upon his retirement from the directorship of the Apollo Club, a position he has held ever since the inauguration of the club. It will be remembered that Mr. Lang tendered his resignation a year ago, to take effect at the close of the present season, although it was against the wish of the club, individually and collectively, that he should sever his connection with it. One morning when Mr. Lang entered his studio, he was surprised to see a lamp burning there; still greater was his surprise to see that the rays of the lamp—by the way of itself a handsome present—fell upon a beautiful silver tea service, given by the club as a testimonial of his long and faithful service, and in token of their affection for their director.

William H. Sherwood, of Chicago, was heard in the Temple of Music at the Pan-American Exposition July 16, under the auspices of the Chautauqua Assembly. Upon his performance the Buffalo *Express* commented as follows: "When Mr. Sherwood came upon the stage he was received with a cordiality which must have been very gratifying. It is fitting, indeed, that so line and representative an American artist should be heard at the Pan-American. For years he has worked vigorously to advance the cause of American music. He has introduced the compositions of previously unknown American composers, and played again and again those of standard American musicians. It would be both appropriate and gratifying if Mr. Sherwood could be engaged to give another entire recital at the Temple of Music.

Very necessary to the composer of songs is the author of the text, and there seems to be a dearth of good lyric authors. William H Gardner, an American, a resident of Boston, is one of the few who have made a success as a writer of words that lend themselves to musical setting. Mr. Gardner enjoys an extensive acquaintance with the best composers in England and America, many of whom he corresponds with regularly. His standing as a lyrist is perhaps best illustrated by the fact that he has collaborated with Edward A MacDowell, who fills the chair of Professor of Music at Columbia University, and whom many critics claim is our best high-class composer, with whom he wrote "Six Love Songs," of which "Thy Beaming Eyes" is the best known; and Sir Alexander Campbell Mackenzie, of London, principal of the Royal Academy of Music, than whom there is no better musician in the "Mother Country."

The closing musicale for the season, of the Bedford, Pa., Piano Club was given on the evening of June 11. The program, which was excellently played, follows: Part I.—Solo, "Cracovienne Fantastique," Paderewski, Miss Elizabeth Metzger. Duet. "Midsummer Night's Dream," Mendelssohn, Miss Barclay, Miss Hughes. Solo, "Drooping Violets," C. D. Blake, Miss McGirr. Solo, "Cavatina," Raff. Miss Hartley. Two-piano movement, Sonata in C, Mozart, Mrs. C J. Musser, Miss L. D. Shuck. Part II.—Solo, (*a*) Caprice Bohemian, Lebierre; (*b*) Farewell to the Piano, Beethoven, Miss Judith Reynolds. Duet, Spanish Dances, Moszkowski, Mrs. H B. Strock, Miss Hartley. Solo, "Fairy Story," Raff. Mrs. C. J. Musser. Solo, Sonata Pathetique, Beethoven, Miss Hetty Barclay. Piano and organ trio, Il Trovatore, Verdi, Mrs. Musser, Miss Mowry, Miss Shuck.

ABROAD.

Eugen d'Albert is at present living in the Villa Mantanina, near Florence. He is working on a three act comic opera, which has already been accepted by the Berlin Royal Opera House.

Three pieces have been discovered to have been wrongly attributed to J. S. Bach. They are a *Prelude and Fugue in E*, by Johann Christoph Bach, a *Passecaille in D*, by C F. Witt, and a *Toccata in A*, by Henry Purcell. It would appear that it is not always easy to discern attributes, even so professedly well known as those of Bach.

M. Paderewski's opera, "Manru," was given in Dresden, May 29, with great success. The music is described as "generally written in Bizet's modern French style, but there are also several suggestions of Wagner." Slav songs are employed in the music. It is reported that at the end of the first act Paderewski was called eight times before the curtain, after the second act ten, and at the end of the third act thirty times.

Mme. Edvige Lamperti, the widow of the late Maestro Lamperti, of Milan, has decided to open a school for singing in Paris this coming fall. It will be in the Quartier Parc Monceau. Voice production, the art of singing, opera, concert, church singing, etc., and for the purpose of finishing pupils, facilitating their débuts will be the chief advantages. Madame Lamperti has been an opera singer herself, and of course is thoroughly equipped for the work before her. She participated with her husband in giving singing lessons to some of the greatest artists before the musical world.

The authenticity of the Schubert MSS. recently discovered in Vienna, in the possession of Jean Wissiagg, has, after examination by experts, been proved. In one of the collections there is an autograph of the first part of a string quartet, with variations on a melody depicting the death of a young girl. On the exterior Schubert has written "Quartet for two violins, alto and 'cello. Franz Schubert, March, 1824." The remainder of the collection consists of a portion of another string quartet, an enormous quantity of MSS., books, and odds and ends of all kinds, which are now being properly classified.

Barron Berthald, the tenor, who made quite a reputation in this country, is one of the principal members of George Musgrove's grand opera company now touring in Australia. When Mr. Berthald made his first appearance with the company, at the Princess Theatre, Melbourne, the Melbourne *Argus* referred to the tenor's début in the antipodes as a "triumph." After singing several weeks at Melbourne, the company began an engagement in Sydney. Mr Berthald will return to the United States by the way of the Pacific, arriving first at San Francisco. While at the Golden Gate Mr. Berthald will fill an engagement at the Tivoli in San Francisco.

A pathetic incident is related of the late W. G. Barker, of Melbourne, who was generally considered the finest bass singer that Australia has yet produced. The nature of the malady from which he suffered necessitated a critical operation on the brain, and it is narrated that as he passed under the influence of chloroform he broke out in his magnificent voice, which was fresh and full after some weeks of rest, with one of his favorite songs—"Out on the Deep"—and the effect was so remarkable as the voice died away and became softer that the surgeons for a few moments were too overcome to proceed with their work. The operation, unfortunately, was not successful.—*St. James' Gazette.*

Some years ago a revision of the "Marseillaise" was executed by some composers under the direction of Ambroise Thomas, and the new orchestration inspired by that of Berlioz was proclaimed the official version to be played by all military bands. Another edition has just been tried by the band of the Municipal Guard of Paris. The principal innovation is a formidable increase in the drums and the addition of forty-five clarions. The Minister of War pronounced the result highly satisfactory, but one of his neighbors was heard to whisper, "Horrible travesty!" M. Jean Tissot, who heard the new version at the Roche Festival at the Trocadero, writes that he was not shocked by the addition of the drums in the refrain, while the clarion seems invented expressly to accentuate the cry, "Aux armes, citoyens!" He regrets, however, that the virile song is left to whining clarinets, in place of being sent out flying by the trombones with their triumphant voices.

PUBLISHER'S COLUMN.

The music supplement of this number contains eight pieces, retailing in sheet-music form at from 20 cents to 40 cents each—amounting to a total of $2.45. Following are the eight pieces referred to above: The poem of the song "The Children in Heaven," by O. L. Carter, is a beautiful story, delightfully treated. The change to G major is very effective. Interesting contrasts of legato and staccato touch are furnished by H. van Gael's pleasing bluette, "Miniature." "Valse de Salon," by D. Schmidt, is a brilliant concert solo, the introduction being especially melodious and pleasing. W. D. Armstrong furnishes a very attractive setting of James Whitcomb Riley's familiar poem entitled: "If I Knew What Poets Know." "Gavotte," by C. Gurlitt (Op. 117, No. 31), is one of the best of the easier compositions by this favorite writer. A brisk and spirited descriptive composition is the "Hunting Idyl," by A. Sartorio (Op. 345). Written in the key of C, and a charming composition, "Fox-Glove March," by T. L. Rickaby, cannot fail to please beginners. The music supplement closes with a "Short Service Prelude for the Organ" (No. 4), by W. H. Clarke. For a description of this prelude, our readers are referred to the pages of the organ department.

***

The August MUSICIAN is a representative midsummer number. This is the "idle" month of the music teacher and student, but many use the time to do a great deal of reading. Realizing this fact THE MUSICIAN has taken pains to fill the number with matter both instructive and pleasing. Without lowering the tone of its contents, it furnishes a varied list of articles by well-known writers who have adapted their writings to the vacation period. There is no diminution in size, but the regular number of pages of reading matter and music. The following articles are especially commended to the attention of our readers: Chopin's Mazurkas, by Frederic S Law; The Triple Aspect of Music, by John S. Van Cleve; To Live Requires Means, by Harvey Wickham; The Study of a Sonata, by Henry G. Hanchett; The Sonata Symphony Form, by Charles S. Skilton; Four Factors in the Art of Violin Study, by George Lehmann; The M. T. N. A. Convention; Why Not Sing English, by W. F. Gates.

***

Our Latest Publications are both practical and useful. "Modern Foundation Studies" and "Modern Studies in Phrasing and Interpretation," both by W. F. Sudds, are the outcome of the author's experience of many years' teaching, and young teachers should give them the careful attention they deserve. "Fingering," by Gordon Saunders, is a comprehensive and extended work in this important branch of piano playing. The author's treatment of the subject, illustrated by extracts from the works of celebrated authorities on pianistic art, is practical, clear and pointed.

Other important works are in preparation. Our aim is to publish and supply the BEST, and our success in obtaining and holding trade is evidence that we are tending in the right direction.

***

The Musician's Premium List. This list, made up of musical works and articles needed by all musicians—students as well as teachers—offers some remarkable inducements. With but little effort, each of our subscribers can secure one or more new subscriptions, and we offer liberal premiums for any interest they may take in extending the circulation of this journal. Send for the list, and build up a library of choice musical works without the expenditure of any money.

***

If you are not satisfied with the way in which your orders have been filled by other dealers, why not give us a trial, and test our ability? Our facilities for promptly filling all orders are unequalled by any house in America. We carry a complete line of all foreign and American publications. We are large publishers—are rapidly building up a catalogue of sheet music and music books that cannot fail to interest teachers, because each subject has been selected on account of its teaching value.

***

Before deciding on your dealer for next year's supplies, write for our new catalogues and best discounts. Compare the latter with those offered by others; note the liberal conditions under which we send selections of music "on sale." They will interest you. During the early Summer months we have prepared many new and excellent subjects, and our selections will contain a splendid variety of all grades. Write for further particulars. Glad to hear from you.

***

Readers of THE MUSICIAN who desire to keep posted upon all new publications of merit, should carefully read the advertising columns of THE MUSICIAN, from which they can secure much valuable information. Any of these publications can be procured through us at the least possible cost.

As a representative or agent of The Musician, vacation season can be made profitable. It makes no difference whether vacation is spent at home, in the country, in the mountains, or at the seashore, musicians—professional and amateur, teachers and students—will be found at all places. While THE MUSICIAN has a very large and constantly increasing circulation, nevertheless this is an immense country and our journal is known to only a small percentage of those who should be acquainted with it and the good work which it is doing. An hour or two each day, devoted to soliciting subscriptions, will pay. We have agents who give only a portion of their time to the work and they obtain from 30 to 40 new subscribers each week. THE MUSICIAN appeals to all who are interested in music, to the student as well as the teacher, and it is an easy matter to take subscriptions. Its price is another consideration. $1.50 per year is a trifling amount for twelve numbers of a journal containing 288 pages of sheet music and 480 pages of musical literature, of a high order of excellence. The quality, as well as the quantity, of matter, is unequalled by any similar publication. Sample copies, order blanks, receipts, full particulars regarding commissions, and all other information will be promptly furnished those who wish to act as agents.

***

Vacation season affords teachers a splendid opportunity to map out the course of study for the coming season, to decide upon the studies to be used and to make up, for convenient reference, lists of the most suitable teaching pieces of all grades. It is a wise precaution to have all of this preparatory work completed prior to the beginning of the teaching season, when routine duties occupy all available time. Our Descriptive Catalogue—new and enlarged edition—ready this month, will prove a valuable aid in this preparatory work. Copies will be sent to any address.

***

TO COLLEGES, SCHOOLS AND TEACHERS.

Now is the time to decide WHERE to place orders for the coming season's supplies.

As we are deeply interested in this matter, we desire to call attention to a few of the reasons why we can make it advantageous and profitable for you to send us your orders.

1. We Make a Specialty of College, School and Teacher Trade.
2. Our Discounts Are More Liberal than those offered by any other house.
3. Our Facilities are Unequalled.
4. All Orders Are Filled by Experts. We pride ourselves on promptness and correctness, two important things for your consideration.
5. Our Own Publications Are Noted for Accuracy and Mechanical Excellence.
6. Our Plan of Sending Music On Sale (for full particulars, see page 225) is Liberal, and only the latest and best music is used for this purpose.
7. We Carry a Complete Line of All Foreign and American Publications.
8. Accounts Opened with Responsible Parties.

Before selecting a dealer, write us for catalogues, discounts and full particulars. If you are not familiar with our publications, allow us to send you a package of music ON SALE. Our selection will convince you that we are progressive and up to date.

We solicit your trade, and are positive that we can save you both time and money.

***

Are You Certain that you are buying your music at as good rates of discount as your fellow teachers? If not, you are doing business at a *disadvantage*. *We claim* that the discounts we allow teachers are MUCH BETTER than offered by other dealers, and unless you have had our latest quotations, you *cannot* be sure that you are not paying *more* for your supplies. This applies not only to our own publications, but to ALL the music you use. On our own publications we offer such liberal discounts (which will be supplied on request) that, no matter how far distant you are, or the cost of Postage or Express, we GUARANTEE you a saving when purchasing from us. In this connection you should remember that we send liberal selections of the latest and most desirable music "ON SALE," with the privilege of returning and having credited, at the end of the teaching season, all that has not been sold or used. Full particulars regarding this department of our business may be had on request. We also offer numerous additional advantages which it is impossible to mention in the limited space of this page. *Write us!* No trouble to answer your letters and inquiries. It will pay you to correspond with a house that is progressive and up-to-date in all of its dealings. We can save you time, trouble and money. We suggest that you give us an opportunity to demonstrate this fact by sending us a trial order, it will bring us your steady patronage.

SOME THINGS OUR READERS SHOULD KNOW AND REMEMBER:

That We Handle and Supply Anything in Music.

That We Are Large Publishers of sheet music—vocal and instrumental—all of which are listed and fully described in our Catalogue—free to any address.

That We Publish many valuable books, in addition to the seventy-three numbers of the "**Hatch Edition,**" listed on page 3 of cover; all are fully described in our Catalogue.

That Our Publications Are Noted For Correctness and Beauty.

That We Carry a Complete Line of All Foreign and American Publications.

That We Supply all Music mentioned in the articles appearing in THE MUSICIAN; all music included in the lists of Desirable Choir Music; all publications mentioned in the advertising columns of THE MUSICIAN.

That we send liberal selections of the latest and most desirable music "ON SALE," with the privilege of returning and having credited, at the end of the teaching season, all which has not been sold or used.

That Our Facilities For Promptly Filling All Orders Are Unequalled.

That All Music is Supplied Teachers at More Liberal Discounts than those offered by any other house.

That You Should Have Our Catalogues and Professional Discounts, both of which will be sent upon request. They will interest you.

***

If in need of a Metronome, one that will give entire satisfaction (all others are worthless) and last a lifetime, send your order to the Hatch Music Co. Owing to the increased cost of manufacturing Metronomes, prices have been advanced by nearly all dealers. We still offer them at the old prices—another proof of our claim that you save money by purchasing from us. We handle only the best makes, and guarantee every instrument for two years. All complaints receive careful attention and prompt adjustment. Our prices ($2.50 and $3.50) are very low, and we offer an extra discount on orders for six or more instruments.

***

We Carry a Complete Stock of American and Foreign Publications of Sheet Music and Music Books and sell these publications, in many instances, at less than the publishers' prices. By placing all of your orders with us, you save time, the trouble and annoyance of looking after several accounts, and procure your supplies at the least cost. Allow us to demonstrate our ability to please you by giving us your trade for the present season. A comparison with former seasons will prove that our claims are based upon facts.

***

The publishers of THE MUSICIAN have exceptional facilities for printing sheet music and music books. Upon receipt of manuscript, with full particulars concerning the style of publication desired, we will submit complete estimate.

***

THE MUSICIAN *wants to keep in close touch* with teachers and schools in all sections, and the editor believes that space devoted to reports of concerts, recitals, lectures on musical subjects and musical events of general interest would prove interesting to readers. You can aid him in making an interesting feature of this department by sending reports of musical happenings that will interest your fellow teachers in other localities.

***

Agents Wanted.—THE MUSICIAN wants good, live representatives to solicit subscriptions. Those having a knowledge of music preferred. Full particulars, including sample copies, order blanks, other helps and terms, will be sent to all who desire to make a trial of this work. No other field of subscription work offers such liberal inducements.

***

Our Offer to send a complete set—seven grades—of the "National Graded Course" (together with a specially prepared pamphlet entitled: "Hints for Obtaining the Best Results in Using the National Graded Course") subject to examination and approval, without any obligation to purchase, is still open. Hundreds of teachers and schools, now exclusively using this Course, became acquainted with its merits by taking advantage of our offer. It bears examination, and the longer it is used, the better it is liked. The "National" is gradually taking the place of other works, and is rapidly becoming the standard method of instruction for the piano. Why not allow us to send you a complete set (seven numbers), so that you may carefully examine the works during vacation. We are confident that it will please you, and that you will conclude to use it—that's our experience with all teachers and schools to whom it has been sent for examination, and comparison with other courses.

THE BURROWES MUSICAL KINDERGARTEN METHOD

INSTRUCTION FOR TEACHERS BY HOME STUDY

The many Music Teachers who have signified their desire to acquire this charming method in time for their September Openings are advised as follows:

1. Orders should be sent in as soon as possible.
2. The new, improved and enlarged edition of the Teachers' Manual is ready for distribution.
3. It is well for teachers to familiarize themselves with the method early so that they can spread its fame during July and August, and try and get some newspaper notices. They will then be able to begin the autumn term with better prospects of great success.
4. Teachers may apply the Method to their summer classes, and thus obtain testimonials from parents, which will prove of great value in obtaining pupils for the autumn classes. Do not underestimate the value of an early beginning.

THE BURROWES METHOD was built up for children and from actual study of the needs, preferences, character, and even the whims of children. The authoress has taught a musical kindergarten for many years, during which she has composed songs, invented games, and constructed apparatus too numerous and varied to mention or describe; and of these only the most valuable have been retained. Everything that was dull, cumbersome, ineffective, or unchildlike has been abandoned, and what remains has been tested through and through, and its value proved beyond the shadow of a doubt. There is nothing in it that is not agreeable and entertaining. **IT IS NOT BUILT ON MERE THEORIES.** It is not the inspiration of a day. It is, on the contrary, the **CREAM OF FIVE YEARS OF SPECIAL EFFORT,** and the fruit of many other years of toil and study. The results speak for themselves.

MUSIC TEACHERS OF ALL GRADES should investigate this work. **ADVANCED TEACHERS** will profit largely by establishing kindergarteus in charge of an assistant or partner, thus creating a preparatory department which will act as a feeder to the advanced classes. The advantages of the Method to **YOUNG TEACHERS** are obvious.

All Teachers who have not seen the Art Souvenir Booklet (mailed Free to Teachers) should send their addresses at once.

KATHARINE BURROWES, A 1302 PRESBYTERIAN BUILDING, FIFTH AVENUE, NEW YORK.
WESTERN ADDRESS, 618 SECOND AVENUE, DETROIT, MICH.

Fletcher Music Method

(SIMPLEX AND KINDERGARTEN)

The aim of the Method is to eliminate the drudgery of the study of music and to give a fundamental, systematic and logical musical education in a thorough, natural and pleasurable way; and so make it possible for Music to exercise her three-fold power of development. The System was originated by Evelyn Ashton Fletcher, and the following are a few of the many endorsers and a partial list of the Conservatories in which the System has been adopted.

Dr. Wm. Mason, New York.
Mrs. John Vance Cheney.
Madame Hopekirk.
Philip Sousa.
Franklin Taylor.
Dr. Gerrit Smith, New York.
Wm. Tomlins, Chicago.
Dr. Hugo Riemann, Leipsic.
Thomas Tapper.
Dr. Wm. Cummings, London, Eng.
Kate S. Chittenden, New York.
And others.

University of the State of New York.
Institute of Applied Music, New York.
Departments—Metropolitan College of Music, Metropolitan Conservatory of Music, American Institute of Normal Methods, Synthetic Piano School, Fletcher Music Method.
American Conservatory, Chicago.
Gottschalk Lyric School, Chicago.
Mrs. John Vance Cheney School, Chicago.
Detroit Conservatory.
Broad Street Conservatory, Philadelphia. And others.
Also in the Eleven Leading Conservatories or Colleges of Music in Canada.

There are already over 250 teachers of the System, but the demand is greatly increasing. Miss Fletcher studied for five years in Europe, and has already successfully introduced her System in the European centres, Leipsic, Berlin, Brussels and Paris. Special advantages to those willing to go abroad with the System. The different sets of apparatus invented by Miss Fletcher are fully protected by patents in Canada, the United States, England, Germany, France, Switzerland, etc. This System can not be taught by mail, and the Fletcher certificate of authorization to teach is only obtainable, with the apparatus, by taking the course of instruction. Write for information and circulars with letters of endorsement, to Miss Evelyn Ashton Fletcher, 1125 Madison Ave., or Mrs. E. A. Sturgeon, 5155 Cornell Ave., Chicago, or to the Corresponding Secretary of the Fletcher Musical Association, Miss La B. Brown, the Nightingale, Dudley St., Roxbury, Boston.

AMERICAN
Method of Singing

Copyrighted May, 1900, by the discover,

MARY M. SHEDD,

Auditorium Building, - - CHICAGO.

This method is unlike every other method, and through its scientific foundation work every accepted voice (no matter how small, or whether the age be 3 or 60), is developed into the same tones with which Patti, DeReszke and all great artists were born. Every great artist's voice can be restored to its former beauty with more volume, thrilling tones, pathos, and brilliancy than when formerly at its best, as no singer has ever yet known the possibilities of his voice, or else he would not have lost one note.

Thorough investigation solicited. Booklet free. No one understands this method outside of Chicago Studio.

SCRIBNER'S MUSICAL PUBLICATIONS

Choirs and Choral Music.

MUSIC PUBLISHING

WRITE US FOR FULL PARTICULARS.

We have every facility for the prompt and satisfactory publication of any musical work—no matter whether it is a piece of sheet music or a large book. Our facilities are unsurpassed and there is no kind or style of work in our line which we cannot do in the very best manner at the least possible cost.

Our printing is all that could be desired by the most critical and is equal, in every respect, to the finest European press-work.

HATCH MUSIC COMPANY, PHILADELPHIA.

WANTS.

Under this heading we will insert, *free of charge*, advertisements for musicians, and advertisements of musicians desiring engagements. These advertisements will be limited to five lines, or if they exceed this limit, we charge two cents per word for each word in excess of five lines.

A COLLEGE GRADUATE DESIRES POSITION IN THE EAST; to teach cornet and modern languages. Or in High School (modern language, English or Science), and lead choir or orchestra. Wife teaches piano. Address, H. Hunt, Columbia, Conn.

BY A GRADUATED PIANIST, WITH EXPERIENCE, A POSITION as teacher of piano and organ in a Southern or Western city. Address, Sue D. Holmes, Emporia, Kansas.

A YOUNG WOMAN WISHES A POSITION AS SPECIAL teacher of music in Public Schools. Has had good training in voice culture and methods, with five years experience as regular teacher in city schools. Address, R. C. E., care of THE MUSICIAN.

Guide to Practical Musicianship

For Students of Piano, Organ or Violin

By A. J. GOODRICH.

In his new system, the author does away with the old and slavish process of rote memorizing, *i. e.*, playing notes and repeating them until memorized, without attempting to master the composer's design; and he illustrates the means by which intelligent students may, in a comparatively short time, master any composition that does not present technical difficulties beyond their conception.

The results are three-fold:

1. A great economy of time.
2. An intelligent understanding of compositions.
3. An improved memory.

Professional musicians, practical teachers, amateur musicians and students of music have long felt the need of some improved method that would reduce the time required to memorize a composition, and Mr. Goodrich presents a method that he subjected to a thorough and exhaustive test, with eminently satisfactory results, before putting his ideas in shape for publication. Every musician needs a copy of "Goodrich's Guide to Practical Musicianship." It is the author's firm belief that, by its aid, compositions can be mastered in from one-quarter to one-half the time required by old systems.

Paper Binding. Price, $1.00.

Published by the HATCH MUSIC COMPANY, PHILADELPHIA.

A Special Offer to Schools and Teachers Only.

MUSIC ON SALE

Our Plan: We offer to send, any time during the teaching season, a selection of Sheet Music, Studies, etc., etc., all of which may be retained until the end of the teaching season—until June, 1902—when payment is to be made for the music that has been used or sold, and all that has not been used or sold may be returned and credited. Various terms are applied to this method of doing business. We employ the term—ON SALE—to cover our plan.

[In order to avoid any misunderstanding, it may be well to state that while *On Sale Accounts* need not be settled, either by cash or by cash and returns, as noted above, until the close of the teaching season, *Regular Accounts* (those made up of items for music, books, etc., specially ordered) are due and payable monthly. Music specially ordered is not returnable.]

Its Advantages: While our plan of sending music ON SALE may offer the greatest inducements to those located in smaller cities, and in towns and villages where there are no large and complete stocks of music, it nevertheless offers advantages to those who reside in the largest cities. The possession of an up-to-date assortment of teaching material insures a supply of music suitable for all purposes and for pupils of all grades; avoids the necessity of hurriedly ordering music; makes one independent of delays in mail and express deliveries; enables one to become intimately acquainted with the latest issues—an important consideration for all who wish to keep fully posted—and puts the teacher who resides at some distance from a complete stock of standard music on an equal footing with fellow-teachers more fortunately located.

Selecting Music: Teachers may make their own selections from our catalogue, which will be mailed upon application, or upon receipt of the blank, printed below, properly filled out, we will make such selection as will, in our opinion, give a complete supply of most useful material. As a rule, the latter plan will be found more satisfactory. The best descriptive catalogues fail to give all of the information needed to make suitable selections. Catalogues are complete only when issued, and it is impossible to keep them up-to-date Selections made by us will include our latest and best publications. Our experience in selecting music designed to cover all requirements gives us advantages possessed by comparatively few teachers. We make up more than 90 per cent. of all selections sent ON SALE, and the instances are rare, indeed, when they fail to give entire satisfaction. Our interests lie in sending music that can be used and sold. If we make poor selections, we have our work and trouble for nothing; if we make satisfactory selections, we are assured of payment for a considerable portion, or for all of the shipment; also of good will and future patronage.

Give Full Particulars: Teachers can materially aid us in making judicious and satisfactory selections by giving full information upon the following points: 1st, the approximate number of pupils to be supplied; 2d, the grades of difficulty (we grade all music from 1, very easy, to 7, difficult); 3d, the style or character of music desired; 4th, the kind of studies needed. If vocal music, name the voice; if organ music, let us know whether the music is wanted for pipe or reed organ.

[No matter *how often* ON SALE music is ordered, always give the information noted above. Instructions given with the first, will not answer for subsequent orders. On account of the variety and extent of our mail business, it is impossible to remember each individual case. Explicit instructions with each order will enable us to fill it in a prompt and satisfactory manner.]

Returns and Exchange: The original selection may be retained until the end of the teaching year, as noted above, or any portion that has not been used or sold may be returned any time during the year, at the option of the customer, and exchanged for another selection; we will add, at any time, such additional music as may be desired—all to be included in the final settlement.

Our Publications are noted for correctness and beauty, and as each subject has been selected because it possessed some special teaching merit, the entire catalogue is exceptionally useful. The value of our editions has been greatly enhanced by careful editing. Among the leading teachers of this country who do our editorial work, we mention the following: William Mason, William H. Sherwood, W. S. B. Mathews, Albert Ross Parsons, S. B. Mills, Emil Liebling, Robert S. Goldbeck, Richard Hoffman, Wilson G. Smith, Constantin von Sternberg, Bern. Boekelman, Jaroslaw de Zielinski, J. S. Van Cleve, E. R. Kroeger, Thos. a'Becket, Homer N. Bartlett, H. C. Macdougall.

Our Discounts: All ON SALE music is billed at regular cash discounts.

New Accounts: We solicit and open accounts with all responsible parties. Those with whom we have no accounts are requested to send references with first order. As references we prefer music dealers, but do not insist upon having them.

No Risk: *As payment is to be made only for music that is used or sold, acceptance of our offer to send a selection ON SALE involves no obligation to purchase.*

The blank printed below will, if properly filled out, give all the information needed to enable us to make up a selection that will please. Our publications are superior in every respect, and our discounts are more liberal than those offered by any other house. ANY OTHER INFORMATION DESIRED WILL BE CHEERFULLY FURNISHED.

HATCH MUSIC COMPANY, = PHILADELPHIA, PA.

Detach this blank and fill out carefully.

Hatch Music Company,
Eighth and Locust Streets,
Philadelphia, Pa.

GENTLEMEN:

Upon the conditions named in your "Special Offer to Schools and Teachers Only," you may send me a selection of music—ON SALE.

It is understood that this music is to be sent upon the following conditions:

1. That it may be retained until the end of the teaching season—until June, 1902—at which time I agree to return all music which has not been used or sold, and remit for the balance.
2. **That I will not return any music which has been used, marked or soiled.**
3. **That I will pay all transportation charges.**
4. **That no music specially ordered by me is to be included in my return of ON SALE music.**

(By filling out the blank spaces below, you will give all the information needed to enable us make a selection that will please you.)

Approximate Number of Pupils to be Supplied

Cramer's 50 Selected Studies.

stematically Arranged. Fingering and Marks of Execution Critically Revised, with Instructive Notes. Exhaustive Preface.

Edited by DR. HANS VON BÜLOW.

English Translation by LOUIS ROTHFELD

A new, correct and elegant edition of these celebrated studies. be belief that there was room for another edition was based ll for $2.50 per copy, while this, which is superior in many spects, is offered for $1.50—a reduction of 40 per cent. from the tablished price. The reduction in price does not, in any way, duce the quality of the work, as the plates, paper, printing and ding are of the highest order of excellence.

Paper Binding. Cloth Back. Price, $1.50.

PUBLISHED BY HATCH MUSIC COMPANY.

Exercises, Scales and Arpeggios.

By HAMILTON C. MACDOUGALL.

is work contains exercises for the various technical points in playing; the scales (major and minor) with their fingerng directions for the formation and fingering of arpeggi of the en chords of the keys, chords of the dominant and diminhed seventh, etc., etc. It is, however, very much more than is. The exercises are entirely out of the beaten track and are anged so that any pupil can understand the manner of practice. The same plan is followed with regard to the scales and arpeggi making the work valuable for instruction in technique. cially commend it to all teachers who wish to get out of ordinary rut of technical teaching. For purposes of self-ction it will be found very valuable.

Paper Binding. Price, 50 Cents.

PUBLISHED BY HATCH MUSIC COMPANY.

METRONOMES

GRADE 1.

The Corner Stone of the Course.

Table Exercises; Instructions from the Very Beginning, Most Carefully Graded; Difficulties Introduced in Logical Order; Interesting Exercises and Etudes; No Octaves; Exercises for Free Wrist; Major Scales—*Written*, but *not* Played

GRADE 2.

Introduction of Scale Playing; Exercises for Passing Under the Thumb; Minor Scales Written; Beginning of Arpeggio Work (Broken Chords); Major and Minor Chords Awakening of the Ideal of the Singing Touch; Interesting Etudes; Careful Grading of Difficulties.

The Preparatory Gymnastic Exercises, in Grade 1, are Practical and Helpful

GRADE 3.

Velocity Assumes Some Importance; Attention Given to the Staccato, while Cantabile Playing Is Carried Along with Equal Care; Etudes Become More Like Pieces; Polyphonic Playing Introduced; Exercises for Weak Fingers in Each Hand.

GRADE 4.

Polyphonic Playing Carried Forward; Rhythmical Problems (Two Against Three) Introduced; Greater Richness in the Etudes; Etudes for Melody Playing, Rapid Runs, Trills, Arpeggi, Marked Rhythms, Extreme Agility, Fourth and Fifth Fingers Interest Maintained Throughout the Grade.

GRADE 5.

Musical Material of Great Beauty; Etudes for Left Hand, Octaves, Polyphonic Playing, Staccato, Double Notes, Grand Arpeggi, Fourth and Fifth Fingers. In Singing Tone, Touch, Velocity and General Intelligence, Much More is Demanded of the Pupil.

GRADE 6.

Etudes for Extended Finger Touches, Staccato, Double Notes, Extreme Rapidity in Staccato and Runs; More Attention Given to Octaves; Pupil's Task Steadily Increasing in Difficulty—Greater Requirements in Regard to Touch, Interpretation, Color and Phrasing.

GRADE 7.

Pieces and Etudes by Saint-Saëns, Henselt, Kullak, Chopin, Mendelssohn, Raff, Alkan and others. These, Making Greater Demands upon the Pupil, advance his Technical Skill to the Highest Efficiency and Insure Ability to Interpret the Greatest Works for the Piano.

Several Opinions.

WILLIAM H. SHERWOOD: I am happy to state that the "National Graded Course" is remarkably adapted to the needs of teachers and students of music. Your claim in regard to the excellent grading of the studies is a thoroughly just one. I do not think that I have ever seen as good a succession of topics and exercises arranged as they are from the beginning on, using the best kind of materials from all sources and without any superfluous pages.

WILSON G. SMITH: I have been particularly impressed with the practical value and uniform excellence of the "National Graded Course."

AD M. FOERSTER: The "National Graded Course" is destined to hold a foremost position among the works of its class. I do not know of a better work, one containing a more interesting and valuable selection of studies and pieces for the various peculiarities to be mastered. A list of desirable pieces that may be added to each part, if found necessary, is given in each grade, also definitions of all musical terms used in this work. The work is bound to find favor with thoughtful teachers and students.

O. R. SKINNER: I like the "National Graded Course" much better than any other work I am familiar with. The editing seems to be thoroughly well done, and the print leaves nothing to be desired.

(Want of space alone prevents printing the opinions of hundreds of well-known teachers in all sections of the United States and Canada.)

It Will Help YOU in Your Teaching.

Because

- It embodies the work of the most eminent pianists and teachers in America.
- It can be readily adapted to your "method," no matter what that may be.
- It is the LATEST work of the kind.
- ALL of the studies are carefully annotated, fingered and edited.
- It is the most carefully graded of any course before the public.
- It begins at the beginning of study.
- It saves the time that otherwise would be spent in laborious and often unrewarded search after that which is good and up-to-date.
- It covers the entire field of piano literature in an eminently practical, interesting and stimulating manner.
- Hundreds of your fellow teachers from all parts of the country have sent us unsolicited, enthusiastic commendations of these very features

This complete work (7 grades) together with a specially prepared pamphlet entitled "Hints for Obtaining the Best Results in Using the National Graded Course," will be sent upon request, subject to examination and approval—without any obligation to purchase.

The "Hatch Edition"

Diminished reproduction of cover plate used on the "Hatch Edition"

All numbers included in this list have been carefully edited and annotated by leading American teachers, our corps of editors including: W. S. B. Mathews, Wm. H. Sherwood, Frank H Tubbs, Frederic W Root, R. S. Goldbeck, Jaroslaw de Zielinski, J. S. Van Cleve, Thos. a'Becket, Wilson G. Smith, H. C. Macdougall, Bernhard Listemann, etc. This important work has never been attempted by any other publisher. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Regardless of the additional expense involved in the publication of annotated editions, prices have not been advanced, but are the same as those charged for ordinary reprints of the works included in this list.

VOICE.

No. 48. ABT. Op. 474. Practical Singing Tutor. For Soprano or Tenor. Complete 1 50
Revised, edited and adapted, with practical preparation for singing, by Frank H Tubbs

No. 9. BONOLDI. Complete and Progressive Vocal Exercises. New Edition, with Exhaustive Introduction by Frederic W. Root. Soprano . . . 60

Prices quoted do not include Express or Mail. If ordered by mail, add 40 cents to the price quoted for each style.

WITH
Practical Suggestions
TO
Students of Music.

Is Entirely New and Superior to Anything of Similar Character That Has Ever Been Offered.

The Tablet is 6⅞ x 10¾ Ins.

It contains 100 Sheets—each with 12 staves. The paper is first-class—suitable for writing with either pen or pencil. The leaves are perforated so that they can readily be removed. Second page of cover contains, for ready reference, the following: Notation, Display of Tetrachords, Cycle of Keys, Condensed History of the Minor Scale, Relationship of the Minor Scale. Manchester's is so much superior to all other tablets, that an examination will insure its use.

Price, 20 Cents.

By Mail, 28 Cents.

Liberal discount when ordered in quantities.

THE ART OF MELODY PLAYING

A COLLECTION OF STUDY PIECES.

Compiled and edited with special reference to the development of a singing style and touch in piano playing

By WILSON G. SMITH.

The ability to present melodies in a singing style is a feature of vital importance in piano playing. The material composing this collection has been selected by the editor for the especial purpose of presenting a series of piano pieces so graded and arranged as to develop a singing touch. In his preface the author says: "To approximate the full singing tone of the human voice, or of a violoncello, is the highest attainment of an artist and the pieces printed will, to a great extent, awaken in the mind of the student the method of acquiring this accomplishment." A handsome volume of sixty-four pages

Paper Binding. Price, 75 Cents.

New Set of Teaching Pieces.

The Carnival
By WILHELM KIENZL. Op. 51. Grades III-IV.

A collection of excellent and pleasing salon pieces of medium difficulty. Especially valuable for recreation, while useful for teaching purposes.

Ländler . . . . . .30 | Mazurka 35
Polka . . . . . .30 | Waltz 40

Childrens' Hop
Six Easy Dances by GÉZA HORVÁTH. Op. 21. Grade II.

For cheerfulness, brilliancy and variety, this collection has few equals. All possess originality, and each number has been carefully revised, fingered and annotated.

Polonaise . . . . . .25 | Polka . . . . . .25 | Polka Mazurka 25
Waltz . . . . . .25 | Schottische . . . . . .25 | Petite Polka 25

Childrens' Jubilee
Twelve Easy and Instructive Pieces Without Octaves and Arranged in Progressive Order.
By ALBERT BIEHL. Op. 143. Grades I-II.

The numbers are arranged in progressive order, according to degree of difficulty, the first nine being included in Grade I. the others in Grade II. For teaching purposes, the collection is a very valuable one, the subjects possessing especial interest for pupils.

The Birthday . . . . . .25 | Who Will Dance with Me? . . .25 | Parade of the Guard 25
Dolls' Dance . . . . . .25 | A Stroll in the Country . . . .25 | Little Rider 25
Rolling Hoop . . . . . .25 | Playing Soldiers . . . . . .25 | Little Gipsy 25
Hans and Gretchen . . . . . .25 | Vacation Joys . . . . . .25 | Turkish March 25

Eight Little Sketches
By ARTHUR ALLEN. Grade II.

A set of extremely melodious pieces without octaves, and of an unusually attractive form. All of these pieces can be advantageously used.

Menuet . . . . . .25 | In Merry Mood . . . . . .25 | In the Night 25
The Organ Man Plays . . . . . .25 | Gavotte . . . . . .25 | Will o' the Wisp 25
Melody . . . . . .25 | | Slumber Song 25

Field Flowers
Six Easy Pieces by T. L. RICKABY. Op. 37. Grade I.

An entertaining and instructive collection of first grade pieces. All are written in the easier keys (C, G, F), and while all are melodious and designed to interest pupils, each piece illustrates some essential point of piano playing.

Golden Rod Galop . . . . . .25 | Blue Bell Polka . . . . . .25 | Primrose—Melody 25
Buttercup Mazurka . . . . . .25 | Daisy Waltz . . . . . .25 | Fox-Glove March 25

From Woods and Meadows
Six Melodious and Characteristic Pieces.
By WILHELM LEGE. Op. 59. Grades II-III.

An admirable set of teaching pieces, which cannot fail to attract attention and prove extremely useful. As each differs from the others, the set presents six different and extremely interesting styles.

Dance of the Sylphes . . . . . .30 | Whispering Reeds . . . . . .30 | Song of the Sirens 30
Butterflies . . . . . .30 | Wood Bird . . . . . .30 | Rustling Brooklet 30

Hungarian Idyls
By IMRE SZÉKELY. Grades II-III-IV.

Unique collection presenting strange but extremely interesting musical ideas. While not difficult to play, intelligent comprehension requires strict attention. All of the pieces have been carefully revised and fingered.

Little Marie . . . . . .25 | Miller's Song . . . . . .25 | Return to the Meadow 25
Shepherd's Song . . . . . .25 | Rural Greeting . . . . . .25 | Wedding Dance 25
Harvest Home . . . . . .25 | Sweet Secret . . . . . .25 | Song of the Wanderer 25

A Merry Party
Six Easy Dances by L. STREABBOG. Op. 288. Grades I-II.

As no octaves are used, these pieces are especially suitable for small hands. They combine, to a marked degree, both pleasure and profit. All are fingered, and all have metronome marks in addition to the useful annotations. With the exception of the Gavotte (Grade II), all are in the first grade.

Valse . . . . . .25 | Polka . . . . . .25 | Mazurka 25
Schottische . . . . . .25 | Gavotte . . . . . .25 | Galop 25

Mother Goose Dances
Six Easy Little Pieces by H. ENGELMANN. Op. 408. Grade I.

Designed for instruction as well as amusement, and each piece is adapted for the hands of young players. Contrasts of rhythm and careful fingering make this an especially valuable set.

Mother Hubbard Waltz . . . . . .25 | Little Bo-Peep Mazurka . . . . .25 | Little Boy Blue March 25
Curly Locks Polka . . . . . .25 | Humpty Dumpty Schottische . .25 | Jack and Jill Galop 25

Musical Picture Book
by RICHARD EILENBERG. Op. 210. Grade II.

Six charming little compositions of the Second Grade, each differing in style from the others. All are carefully fingered, and the annotations clearly indicate correct methods of playing. A desirable and very useful set.

With Drums and Colors Flying . 30 | Doll's Cradle Song . . . . . .25 | The Snowman 30
Ring Around a Rosy . . . . . .25 | A Dance in the Fields . . . . . .30 | On the Swing 30

Old King Cole and His Fiddlers 3
Six Easy and Instructive Little Dances
By H. ENGELMANN. Op. 422. Grade I.

Unique collection of Grade I pieces, in which style, tone and touch are judiciously contrasted. These qualities and the melodic beauty of the compositions make the set especially valuable for teaching purposes.

The Start Up Waltz . . . . . .25 | The King's Delight Mazurka . . .25 | Old King Cole's March 25
Tweedle-Dee Polka . . . . . .25 | The Pipe and Bowl Schottische . 25 | The Wind-Up Galop 25

A Summer Day
Five Easy and Instructive Little Pieces by H. ENGELMANN. Op. 430. Grade II.

Splendid collection of pieces intended to give pretty and interesting examples of various styles and movements other than the usual dance forms. All are in the Second Grade, and as all are carefully fingered, they cannot fail to prove useful.

At Dawn—Reverie . . . . . .25 | | A Summer Night—Nocturne . . .25
Out for a Day's Sport—Rondo . .25 | The Hop on the Lawn—Polonaise . 25 | A Jolly Parting—Scherzo 25

Sunbeams
Eight Easy Little Dances by O. R. BLUM. Grades I-II.

Although primarily written for pupils' recreation, this group contains much that is valuable for purposes of instruction, and will be appreciated by those who strive to make the study of music bright and agreeable. With the exception of the first and last pieces, which are classed in the second grade, all are first grade pieces.

Young Cavalier's March . . . . .25 | Oh! Such Fun Waltz . . . . . .25 | In the Grove Schottische 25
Joys of Life Polka . . . . . .25 | Blind Man's Buff Galop . . . . .25 | Playing Soldier—March-Rondo . 25
Bessie's Schottische . . . . . .25 | Nimble Feet Polka 25

VIRGIL CLAVIER METHOD

Extract from letter dated August 4, 1901.

"I have studied nearly all so-called method, and I am frank to say that I consider the *Virgil Method* the only method extant. All the others are a conglomeration of ideas, lacking in system and in logic, and I am satisfied it is the only method calculated to reach artistic results by a logical process."

GILMORE WARD BRYANT, Director,
Southern Conservatory of Music,
Durham, N. C.

Foundation Exercises, Vol. I, $2.50
Foundation Exercises, Vol. II, 2.50
By A. K. VIRGIL.

Berlin Test Class,
By FLORENCE DODD, $1.50
The first forty lessons given to the Test Class in Berlin.

Special terms on all publications given to teachers.

The American Institute of Normal Methods.

VOICE DEPARTMENT Under Direction of
MR. TOM KARL.

Graded Certificates—Diplomas—Degrees Mus. Bac. Mus. Doc.

Faculty and Examiners: Wm. Mason, Albert Ross Parsons, A.C.M.; Harry Rowe Shelley, A.C.M.; Paul Ambrose; William F. Sherman; Kate S. Chittenden; Lillian Littlehales; Tom Karl, and 25 others.

Advantages unequalled in America are afforded to pupils. The residence department furnishes a refined and quiet home.

For further information address,
KATE S. CHITTENDEN, Dean.

AMERICAN METHOD OF SINGING

Through this scientific method every accepted voice is developed into the *same* tones with which our great artists were born.

MARY M. SHEDD,
Discoverer and Teacher of this Method,
Auditorium Building, Chicago,

will be at the Waldorf-Astoria, New York City, from Sept. 16th to 23d. The method will be demonstrated by Miss Shedd, and the pupils who accompany her. Booklet free.

Standard and Popular Books Published and For Sale by the Hatch Music Company.

Franz Abt's Practical Singing Tutor

Op. 474. FOR SOPRANO OR TENOR. COMPLETE.

Revised, Edited and Adapted, with Practical Preparation for Singing,

By FRANK H. TUBBS.

In a concise treatise on the voice, Mr. Tubbs leads the way to a correct application of voice culture to the vocalizes, making this one of the few practical and useful vocal instructors. Ask for the "HATCH EDITION," and take no other if you want the best.

Paper Binding. Price, $1.50.

Bonoldi's Complete and Progressive Vocal Exercises

SOPRANO. CONTRALTO.

With Exhaustive Introduction by Frederic W. Root.

When the studeut has mastered the principles of voice placing and breath control, practice upon these principles, until habits are formed, is of the utmost importance. It is highly important also that the pupil's ear should be familiarized with all sorts of intervals, and his mind trained to easy comprehension of the various melodic and rhythmic forms which are found iu the musical repertoire. Perhaps uo collection of vocal exercises meets the equirements in all these fields better than BONOLDI'S. Practice the florid passages, constituting the main substance of this work, is a guarantee against rigidity or strained condition of the throat. The exhaustive introdnction, by Frederic W. Root, is designed to throw much light upon the uses to which these exercises can he put, and to keep before the mind certain essential considerations frequently overlooked by teachers and pupils. Ask for the "HATCH EDITION." Take no other, if you want the best.

Paper Binding. Price, 60 Cents Each.

Panofka's 24 Progressive Vocalizes

VOLS. 1-2.

Revised, with Preparatory Sketch, by FRANK H. TUBBS.

For the cultivation of pure *legato*, flexibility, *staccato* and the embellishments, it is doubtful whether there are any more useful collections of vocal exercises. In the editorial work, Mr. Tubbs has exercised his usual skil l. His suggestions will be prized by teachers, and students will appreciate the Prefatory Sketch that he has supplied. Ask for tne "HATCH EDITION," and take no other if you want the best.

Paper Binding. Price, $1.00 Each.

Sieber's 36 Elementary Vocalises

Op. 92-97 Inclusive

FOR SOPRANO, MEZZO SOPRANO, ALTO, TENOR, BARITONE AND BASS

With Introductory Notes by FREDERIC W. ROOT.

Sieber's 36 Eight Measure Vocalises, for all voices, are well known and appreciated by teachers. The composer had a double object in view and prepared them for use in the school, as well as for self-study at home. The book for each voice differs from the companion volumes, as the exercises were written with especial regard for the voice part under consideration. Each study is contained within eight bars—therefore do not become tedious—and are written with the *sol fa* syllables, also with an ingenious and effective set of vowel sounds designed by the composer, who is a teacher of European celebrity. All of his studies are melodious and interesting.

Our new edition is, in every respect, the finest in print. These studies have, heretofore, been published only in sheet music form, at $1 50 each. While our new edition is of much more convenient size and much handsomer in every way, it is sold for 50 cents per copy.

Mr. Frederic W. Root says: "The new edition of Sieber's Exercises are beautifully gotten out and I hope will be properly appreciated. I congratulate you upon the edition and hope to use it in my teaching for many a year."

Paper Binding. Price, 50c. Each.

ENGLISH SONGS AND BALLADS, HIGH VOICE

VOLS. 1-2.

Magnificent Collection of Popular English Songs.

England is noted for her songs and ballads and their popularity is world-wide. These two volumes contain the choicest works of a great number of the best known composers, and we are justified in making the claim that they are superior, in every respect, to any similar works. Each volume contains 162 pages. The cover of Vol. 1 contains an excellent portrait of F. H. Cowen, while the cover of the second volume is illustrated by a portrait of Ciro Pinsuti.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

ENGLISH SONGS AND BALLADS, LOW VOICE

Gems for Altos and Baritones.

Pinsuti, Tosti, Gounod, Tours, Denza, Mattei, Trotère and a host of other master song writers found the highest appreciation of their talents in England. Association with Cowen, Adams, Watson, Jude, Thomas, Rodney, Temple, Molloy and other leading composers of native birth, led to a blending of the merits and beauty of all the leading European nations.

Intended for altos and baritones, none of the songs in this collection extend above E, while several are especially adapted for very low bass voice. The best collection in print; unequalled for parlor or concert use.

Paper, with Cloth Back. Price, $1.00. Half Cloth. Price, $1.25.

Magnificent Editions of Standard Piano Methods

Particular attention is called to the "HATCH EDITION" of the works named below. No expense has been spared in the preparation of this edition. While all have been carefully edited by teachers of national reputation, prices have not been increased. The best is, therefore, offered at the cost of inferior editions.

Köhler's Practical Method for the Piano. Op. 249. Vols. 1-2-3. Paper Binding. Each $ 75

Revised, Fingered and Annotated by Thos. a'Becket.

The only ANNOTATED edition; the only edition in which the PHRASING is presented in accordance with the latest and most advanced ideas; the only edition that has had a comprehensive and thorough revision.

Löw's Practical Four Hand Piano Method. Vols. 1-2 . . . . . Paper Binding. Each $ 75

Revised, Fingered and Annotated by Wilson G. Smith.

Designed as a companion to all books of instruction for the piano, this method is a favorite with teachers. The perfect ensemble players are those who blend their individual characteristics in order to form a perfect whole, and this important accomplishment may be obtained by careful and conscientious study of Löw's Method.

Wagner's First Instructor for Young Beginners. Vols. 1-2 . . . Paper Binding. Each $ 75

New and Revised Edition. English and German Text.

This work, designed for the instruction of young beginners, presents a thorough and exhaustive course for the systematic training of children. The orighal edition (published with German text only) is a great favorite with leading German teachers in this country, while it holds a commanding position in Germany where it is a recognized standard not only for children, but for adults who take up the study of the piano.

All works included in the "HATCH EDITION" are printed from new plates. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Ask for the "HATCH EDITION," and take no other if you want the best.

KÜHNER'S ETUDE SCHOOL FOR PIANO PLAYERS

A Model Collection of Well Graded Studies.

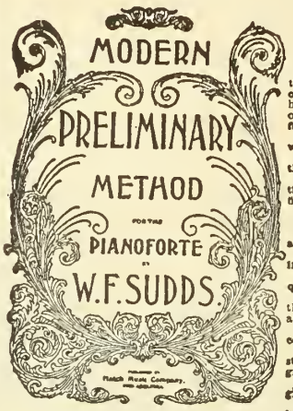
Book 1. Lower Elementary Grade.
Book 2. Higher Elementary Grade.
Book 3. Lower Medium Grade, Part 1.
Book 4. Lower Medium Grade, Part 2.
Book 5. Higher Medium Grade, Part 1.
Book 6. Higher Medium Grade, Part 2.

Kühner's Etude School embraces the entire technic of the piano in unbroken succession, represented by such models in Etude literature as are calculated to elevate the intellectual as well as the purely technical knowledge of the piano player at each stage of his progress. To avoid all danger of a one-sided development, every variety of style—from the simplest study to the magnificent studies of Liszt, Henselt and Chopin—is represented. It was a great idea to call the best thoughts of the greatest instructors, but a much greater idea to progressively arrange them so that they comprise the student's first lesson as well as those that immediately precede his graduation. Each study has been carefully revised, and explanatory notes have been added to many of them. Ask for the "HATCH EDITION," and take no other if you want the best.

Paper Binding. Price, 75 Cents Each.

MODERN PRELIMINARY METHOD

FOR THE PIANOFORTE



Embodying the Latest and Most Approved Systems Conducive to Rapid Progress and Artistic Interpretation

By W. F. SUDDS.

As its title implies, this Method is modern, contains the newest ideas and their practical application. The bulky and voluminous instruction book is a thing of the past. The Method of to-day deals with *more* subjects than its predecessors, but deals with them in a terse and effective manner. It recognizes the importance of practical exemplification of the principles involved, but wisely leaves the application of various points to future study.

Among the many excellent features of the Modern Preliminary Method, we direct attention to the following:

The Rudiments are very progressive and explained with such clearness that the pupil cannot fail to comprehend them.

The Various Touches are clearly set forth and are accompanied by illustrations, drawn and engraved expressly for this work, showing the movements of finger, hand and arm.

The Correct Principles of Touch and Technic are illustrated by examples.

The Scales are introduced in an effective manner.

Proper Use of the Pedals, a matter generally disregarded, is given particular attention.

The Explanation of the Minor Mode, another subject seldom touched upon in works of this character, is such that it can be readily understood.

Five-finger Exercises are judiciously used, but not in the usual enormous quantity that disgusts and discourages the pupil.

The Musical Illustrations attending the various principles are taken from the best composers, of whom short sketches are given. This introduces a desirable amount of musical history.

The aim is to teach and illustrate one thing at a time. By a judicious contrast of subjects, weariness is avoided.

Four Hand Pieces are introduced, not merely for recreation, but to promote steadiness and inspire confidence in the pupil. This plan has the approval of all great teachers.

A Copious and Carefully Compiled Pronouncing Dictionary—a matter of great importance to a work of this character—is included.

It is a Complete Preliminary Method—a work which cannot fail to interest both the practical teacher and the earnest student.

MODERN PRELIMINARY METHOD is the result of many years' experience as a teacher, by an editor who needs no introduction to the musical public. It is a book of 144 pages (10 x 13 inches), printed from entirely new plates on the best grade of music book paper.

Half Cloth Binding. Price, $1.00.

KULLAK'S SEVEN OCTAVE STUDIES

From the School of Octave Playing. Op. 48, No. 2.

Revised and Annotated, with Introduction and Practical Directions for Study, by

WILLIAM H. SHERWOOD.

While numerous exercises for the practice of octaves have been presented to the musical world by virtuosi and masters, Kullak's is the only method or "School" of octave playing that has become a standard. But good as they are in their original form, it is remarkable how much the usefulness of these studies has been enhanced by Mr. Sherwood's revision and annotations. A broad foundation embodying the general principles involved and the method by which the end may be most satisfactorily attained is laid in his Prelimioary Remarks; instructions and suggestions for technical preparation are given in his "Notes on the Studies;" each study is *treated in detail*. Each movement of the hand and arm is designated by an ingenious device and these characters, elaborately used throughout the text, show the student *exactly* how the hand should approach and leave the keyboard in performing various passages. The progressive teacher will appreciate the importance of Mr. Sherwood's editorial work, and especially so since he gives, for the first time, his system of of instruction in octavo playing.

Regardless of the great expense involved in the preparation of this edition, the price is the same as that charged for the ordinary reprint.

Paper Binding. Price, $1.25.

Classic Piano Solos for Young People

VOLS. 1-2.

ELEGANT COLLECTIONS BY WELL-KNOWN WRITERS.

Classics selected for the young are frequently of the dryest character and students are too apt to absorb the idea that good music *must be dull*. In the preparation of these collections the requirements of the youthful mind were kept in view, and the selection of works will prove that music of an advanced standard can be pleasing as well as useful in the formation of a correct and pure musical taste. These works are unequalled by any similar publications of corresponding grade. A critical comparison will establish our claims of superiority.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

CLASSIC PIANO SOLOS

VOLS. 1-2.

Superb Collections by Eminent Authors.

While the contents of Volume 1 is largely made up of the works of the older masters, with but few exceptions the pieces included in Volume 2 are the works of the more modern classical writers, many of whom are still living. All of the compositions of both volumes are within the capabilities of the ordinarily good performer and will be found most interesting whether used for purposes of recreation or instruction. We ask a critical examination and comparison with works of similar character.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

Classic Gems for Four Hands
Popular Gems for Four Hands

These are not the only collections of piano duets published in book form, but with one or two exceptions they are the only books of similar character for which new plates were especially prepared. As they were not published for the purpose of finding new and profitable use for several hundred old and worn-out sheet music plates, the editor was not hampered in making his selection of subjects; material was selected regardless of anything other than merit—each piece being subjected to severe criticism.

"CLASSIC GEMS" contains works of standard grade and attractive style in which the difficulties are equally shared by the two performers. While compositions of extreme difficulty were excluded, the editor maintained a standard worthy the attention of players of average ability. A strong work; one that we can heartily recommend.

"POPULAR GEMS" is a collection of pleasing music of varied and interesting character. It entertains the listener, and performers feel that their efforts have been worthily expended. While brilliant, the works are not difficult; nevertheless each possesses sufficient difficulty to interest, without overtaxing the performer. The best collection of easy and medium grade four hand music ever published in book form.

Paper, with Cloth Back. Price, $1.00 Each. Half Cloth. Price, $1.25 Each.

MAGNIFICENT EDITIONS OF STANDARD WORKS

Particular attention is called to the "HATCH EDITION" of the works named below. No expense has been spared in the preparation of this edition. While all have been carefully edited by musicians of national and international reputation, prices have not been increased. The best is, therefore, offered at the cost of inferior editions.

Chopin's Album for the Pianoforte . . . . . Paper Binding. $1 00
Revised and Fingered by Carl Mikuli.

Chopin's Nocturnes for the Pianoforte . . . . . Paper Binding. 75
Revised and Fingered by Carl Mikuli.

Chopin's Waltzes for the Pianoforte . . . . . Paper Binding. 50
Revised and Fingered by Carl Mikuli.

Clementi's Sonatinas for the Pianoforte . . . . . Paper Binding. 50
Edited and Annotated (after Köhler's Latest Revision) by Robert Goldbeck.

Kuhlau's Sonatinas for the Pianoforte. Vols. 1-2 . . . . . Paper Binding. Each 50
Edited and Annotated (after Köhler's Latest Revision) by J. S. Van Cleve.

Mendelssohn's Songs Without Words . . . . . Paper Binding. 1 00
Edited and Annotated (after Kullak's Latest Edition), by Jaroslaw de Zielinski.

Schumann's Album for the Pianoforte . . . . . Paper Binding. 50
Revised, Fingered and Annotated by H. C. Macdougall.

Sonatina Album for the Pianoforte . . . . . Paper Binding. 75
Edited and Annotated (after Köhler's Latest Revision) by W. S. B. Mathews.

The works included in the "HATCH EDITION" are printed from new plates. The engraving, paper, printing and binding are superior in every respect—each the best of its class. Ask for the "HATCH EDITION" and take no other if you want the best.

"HATCH EDITION."

FIVE NEW NUMBERS.

Particular attention is called to five new numbers described below, which have just been added to this well-known series. Without a doubt, the "Hatch" is superior to any other low-priced edition of standard works. All numbers have been carefully edited by leading American teachers, and the works named in this list (see list of sixty-eight numbers printed on page 2 of cover), are the only annotated editions of same printed in the English language.

Hatch Edition. No. 69.

MINIATURE PICTURES

Twenty-four Easy Little Pieces for the Piano Forte.

By HUGO RHEINHOLD. Op. 39.

Revised, Fingered and Annotated by THOS. a'BECKET.

Written for the purpose of forming a correct taste and for improving the technic of pupils, this collection includes every style of subject and employs every variety of touch. Each number is carefully annotated, explaining in detail the style and touch illustrated by it. A valuable aid for young pupils.

Paper Binding. Price, 60 Cents.

Hatch Edition. No. 70.

RURAL PICTURES

12 Easy, Melodious and Instructive Pieces for the Pianoforte.

By WILHELM FINK. Op. 295.

Revised, Fingered and Annotated by THOS. a'BECKET.

Cannot fail to attract pupils, as the twelve numbers are especially melodious and interesting. Such a work as teachers are constantly needing, and the market is not overcrowded with meritorious collections of similar character.

Paper Binding. Price, 60 Cents.

Hatch Edition. No. 71.

BON BONS

AN ALBUM OF EASY PIECES FOR THE PIANOFORTE.

By GÉZA HORVÁTH. Op. 20.

Revised, Fingered and Annotated by THOS. a'BECKET.

A splendid collection of second and easy third grade pieces of varied style. It would be difficult to find a work that equals this in awakening the musical interest of pupils.

Paper Binding. Price, 50 Cents.

Hatch Edition. No. 72.

Eighteen Melodious Studies in Easy Style

For the Pianoforte.

By MAX PAUL HELLER. Op. 10.

Revised, Fingered and Annotated by THOS. a'BECKET.

One of the best late collections of melodious studies in easy style—and just such a work as teachers can advantageously use all the time.

Paper Binding. Price, 50 Cents.

Hatch Edition. No. 73.

THE CHILDRENS' CORNER

Ten Easy Pieces for the Pianoforte.

By E. HASSE. Op. 52.

Revised, Fingered and Annotated by THOS. a'BECKET.

Ten interesting and useful pieces for pupils in the second grade. Very few works combine, in such a marked degree, useful instruction with recreation and amusement.

Paper Binding. Price, 50 Cents.

Music Paper.

OUR OWN MAKE. BOTH PAPER AND RULING ARE OF THE VERY BEST.

No. 1.	Sheet Music Size, 12 Staves, Octavo,	55 Cents per Quire
No. 4.	Sheet Music Size, 14 Staves, Octavo,	55 Cents per Quire
No. 6.	Sheet Music Size, 16 Staves, Octavo,	55 Cents per Quire

We also carry a full line of all other styles.

Blank Books.

The ordinary trade book is a miserable affair. The binding may be attractive and fairly well done, but the paper is always abominable and the ruling done in anything but a satisfactory manner. In order to meet the demands of our trade, we have manufactured a grade of books which we can recommend with the greatest confidence. The paper is of the very best quality carefully ruled; the binding is neat and substantial.

No. 640.	6 Staves, 40 Pages,	20 Cents Each
No. 864.	8 Staves, 64 Pages,	30 Cents Each
No. 840.	8 Staves, 40 Pages,	20 Cents Each
No. 324.	8 Staves, 24 Pages,	16 Cents Each

Music Writing Pens.

Made of anti corrosive metal, guaranteed smooth, uniform and of great durability. The only pen which should be used for music copying.

Two Samples for 5 Cents. 25 Cents Per Dozen.

MUSIC PUBLISHING

WRITE US FOR FULL PARTICULARS.

We have every facility for the prompt and satisfactory publication of any musical work—no matter whether it is a piece of sheet music or a large book. Our facilities are unsurpassed and there is no kind or style of work in our line which we cannot do in the very best manner at the least possible cost.

Our printing is all that could be desired by the most critical and is equal, in every respect, to the finest European press-work.

HATCH MUSIC COMPANY, PHILADELPHIA.

MR. FRANK H. TUBBS,

VOCAL INSTRUCTION,

121 West 42d St., New York.

Mr. Tubbs' pupils study with him at his seashore home at Allenhurst, N. J., during July and August. Vocal Teachers from Schools and Colleges form the clientele at that time. Send for tuition and board rates.

THE MUSICIAN PREMIUM LIST.

From its inception in 1896, THE MUSICIAN has been the exponent of a well-defined educational policy, which has for its foundation comprehensive musicianship. On this foundation it has built up its remarkably successful record as an educational music journal. Its steady adherence to its mission of aiding teachers and students has been commended by the best authorities in this and other countries, and for the future it proposes the establishment of a yet closer relationship with teachers and students of all grades.

It pays to introduce THE MUSICIAN, and it's an easy matter to obtain subscriptions for the BEST journal of its class. During the year 1900 THE MUSICIAN contained 816 pages of music and musical literature, exclusive of illustrated supplements.

The Premiums named in the list printed below, *apply only to subscribers;* and as they are offered for the purpose of increasing our list of subscribers, *they apply only to NEW subscriptions.*

PREMIUM CONDITIONS.

1. Premiums are given only to those who are already subscribers. Any subscriber is entitled to receive a premium for each NEW subscription sent us.

2. Premiums are not given for less than a full year's subscription; neither do they apply to renewals or transfers.

3. Any combination of the Premiums named in this list will be allowed.

4. Premiums may be ordered when subscriptions are sent us, or the selection of Premiums may be deferred until the list is complete.

NOTE: Unless otherwise specified, all premiums will be sent by mail, postpaid, or by express, at our expense.

CASH PREMIUMS.

(Other Premiums are not given when cash deductions are allowed.)

Two Subscriptions	($1.35 each)	$2.70.
Three "	(1.30 each)	3.90.
Four "	(1.25 each)	5.00.
Five "	(1.20 each)	6.00.
Eight "	(1.15 each)	9.20.
Ten "	(1.10 each)	11.00.

OTHER PREMIUMS.

FOR ONE SUBSCRIPTION.

Any one of the premiums included in this list will be sent to the subscriber who sends One NEW subscription, accompanied by $1.50.

NEW EDITIONS

of our descriptive and illustrated catalogs:

"New Songs,"
"New Piano Music,"
"New Choir and Choral Music."

THESE catalogs contain review notices by musicians eminent in their specialty and are helpful to teachers and choir and choral directors in selecting music.

NEW BOOKS.

Songs for Children.

"Songs of Sunshine." .75
62 songs. A good variety for all occasions.

"Songs of Nature." .60
A collection of songs for festivals, the seasons, etc.

"Mother Goose's Jubilee." $1
60 songs from the opera. The most singable, child-pleasing Mother Goose songs published.

New Piano Music.

"Easy Pieces in Easy Keys, Vol. II." .50
A collection of 40 pieces.

"On the White Keys." $1
An introduction to the piano.

"Four Little Hands." $1
58 easy duets.

"Thirty Duets Without Octaves." $1
For equal performers.

"Harmony Simplified." $1
By Francis L. York, M. A. A practical introduction to composition.

Oliver Ditson Company, Boston.
Chas. H. Ditson & Co., New York.
J. E. Ditson & Co., Philadelphia.

A331

Do You Teach Music to Children?

I. You must interest them.

II. You must know all about the newest and best music that is written for them.

III. You must have abundant material at hand for helpful purposes — short biographies, portraits, prints.

IV. You must give them Simple Lessons in Harmony, Theory, and Musical Dictation.

The highest authorities will aid you in all these matters, in a complete series of articles, especially prepared for Teachers and Students, in the MUSICAL RECORD & REVIEW.

5 Cents per Copy.
50 Cents per Year.

Without Octaves

We have recently issued under the above heading the following series of excellent piano pieces, containing octaves only in broken form if at all. They are of various grades of difficulty and are carefully revised, edited and fingered.

Foerster, A. Schumann, R. Op. 124, No. 6.	Nocturne (Go to Sleep Fairies) Cradle Song	25
Reinecke, Carl Foerster, A.	Dragonfly in the Sunshine The First Snowflakes	25
Hollaender, A.	Birds in the Woods	25
Foerster, A. Oldberg, A.	Flitting Butterflies The Garden Mole	25
Foerster, A. Gurlitt, C.	The Flower Fairies The Rabbit	25
Reinecke, C. Oldberg, A.	The Rain Fairies The Cricket	25
Karganoff, G. Op. 25, No. 5.	The Brook	40
Karganoff, G. Reinecke, C.	Nature's Dream A Dream	25
Gayrhos, E. Reinhold, H.	Spring's Awakening The Gnomes	25
Foerster, A. Foerster, A.	Under the Linden Tree Upon the Meadow	25
Gayrhos, E.	The Reapers	25
Elmenreich, A.	Spinning Song	25
Hollaender, A. Seeboeck, W.C.E.	In Dolly's Kitchen The Shepherd	25
Reinhold, H. Reinecke, C.	Boat Song Hurdy-Gurdy	25
Gurlitt, C. Op. 101, No. 2 Behr, F.	Morning Prayer Night's Song	25

We have just published for the piano

By Mrs. Regina Watson

Scherzino	50
Mazourka Etude	75
An Arabian Night	60

These have been played by Mme. Carreno on her recent tour in America.

Also by Pearle M. Ball

Minuetto from Suite, Op. 7	50
The Dance of the Dryads	40

Two pianoforte compositions of good quality and character, about 4th grade of difficulty.

All the above will be sent on approval.

DO YOU REALIZE

the helpful work we are doing in the matter of examining with great care all new musical publications from which we select only the best and most interesting and list them in *The Music Review*, giving a description of their character, grade of difficulty, etc.

The Music Review

is published monthly, excepting July and August, at a subscription price of 50c. a year.

Consider how valuable to the teacher of music such a catalogue will become as a book of reference.

Modern Foundation Studies

—in—

Piano Playing

Graded for Beginners.

By W. F. SUDDS.

The great progress made in the art of piano playing during the past few years has, to a large extent, rendered older books of instruction obsolete. All good works contain the proper material, but its arrangement, and the method of presenting it to the immature musical mind, often leaves much to be desired. Improvement of these particular features—the arrangement and method—has been the guiding thought in the preparation of "Modern Foundation Studies."

It is a work for beginners, and matters of vital importance, such as formation of the hand, methods of touch and tone-production, are treated in detail. In addition to the comprehensive treatment of these subjects and numerous musical examples, exact positions and movement of the hands in the proper performance of the various touches are profusely illustrated. This feature will be appreciated by teachers.

The work contains foundation material on which the most elaborate superstructure may be safely built. The music has been selected with great care, to clearly illustrate the point under consideration in an attractive manner without wearying the student.

Paper Binding. Price, $1.00.

MODERN STUDIES
In Phrasing and Interpretation.

By W. F. SUDDS.

It is now very generally admitted that a separation of the mental and physical features is the best plan for imparting instruction in the study of music. Both may be studied at one time, but it is a mistake to suppose that mental training is the result of physical effort.

To insure proper performance of a composition, the mental concept must be perfect. A pianist possessed of brilliant technic, acquired only by long and faithful practice, may mar a good work because of inability to interpret the author's ideas, just as one may recite the *words* of a poem without a proper appreciation of their meaning and without a correct grouping into phrases. To thoroughly enjoy a musical work one must be able to analyze it, and "Modern Studies in Phrasing and Interpretation" presents the means of doing this in a most comprehensive and intelligent form.

Want of space prevents a detailed description, but we shall be glad to send the work subject to approval, so that any one may test our assertion that this is a thoroughly modern and practical exposition of the subject.

Paper Binding. Price, $1.00.

THIS SYSTEM IS COVERED BY COPYRIGHT.

MUSICAL KINDERGARTEN FOR THE PIANOFORTE

By FANNIE CHURCH PARSONS.

This system is most simple in outline and material.

It is most comprehensive and complete.

The materials used are, while very durable, most suggestive of the beauty of the art of music.

The lessons are equally instructive to either child or adult beginner.

The students do much real piano work, thus no intermediate course is necessary.

The stories and songs do not savor of the grotesque, but tend to refinement and culture.

The price for normal work, including materials, is within the reach of all.

The work can be taken by mail, or of a normal instructor, or of Mrs. Parsons personally.

Send for illustrated booklets.

Correspondence should be addressed to

SUMMER.

Through the open door
A drowsy smell of flowers—gray heliotrope,
And white sweet clover, and shy mignonette—
Comes faintly in, and silent chorus lends
To the pervading symphony of peace.
—*Whittier: Among the Hills. Prelude.*

It is a sultry day; the sun has drunk
The dew that lay upon the morning grass;
There is no rustling in the lofty elm
That canopies my dwelling, and its shade
Scarce cools me. All is silent, save the faint
And interrupted murmur of the bee,
Settling on the sick flowers, and then again
Instantly on the wing.
—*William Cullen Bryant: Summer Wind.*

Loveliest are thy setting smiles, and fair,
Fairest of all that earth beholds, the hues
That live among the clouds, and flush the air,
Lingering and deepening at the hour of dews.
Then softest gales are breathed, and softest heard
The plaining voice of streams, and pensive note of bird.
—*William Cullen Bryant: Walk at Sunset.*

Rejoice! ye fields, rejoice! and wave with gold,
When August round her precious gifts is flinging;
Lo! the crushed wain is slowly homeward rolled;
The sunburnt reapers jocund lays are singing.
—*Ruskin: The Months.*

In every flower that blooms around,
Some pleasing emblem we may trace;
Young love is in the myrtle found,
And memory in the pansy's grace.
Peace in the olive-branch we see,
And lovely woman in the rose;
Hope in the half-shut iris glows,
In the bright laurel victory!
—*Chazet.*

A STREET SCENE IN NAPLES.

VERVINS-JULIEN.

One evening in 1832, Paganini was to come to the palace at Naples to play before the court some of his marvelous improvisations. It was in the month of July and the concert was to take place at eight o'clock, but by seven the carriages began to arrive at the palace, and the Via de Toledo was full of people. The beautiful bay was flooded with light, for the sun away down the horizon about to disappear beneath the waves, seemed to caress with a last glance of love, this shore to which Winter is unknown. In the distance could be seen the passing sail of some vessel, or the upright prow of a gondola skimming the waves. Upon the shore the sea-birds flew in large circles, and one by one disappeared in the clefts of the rocks. As the daylight faded away, large gleams of red light darted up in the East of the bay; it was Vesuvius that was being lighted like a gigantic light-house, to guide homeward the various vessels which were gliding along over the most beautiful bay in the world.

As one approached the upper portion of the Via di Toledo, the crowds became more dense and the carriages more and more numerous, for it was toward the Royal Palace that most of the carriages were going. Therefore, it was with great difficulty that pedestrians could make their way; a tall, spare man of about fifty years of age, seemed in a hurry to get through, and he elbowed his way through the populace that crowded the sidewalk. Just as he crossed the Via Frattini, he stopped suddenly and listened. "Per Giove," said he, speaking to himself, "what instrument can that be?" He listened again. "What can it be?" And his curiosity became so great that he pushed bravely forward, until he came to an open space, and there he saw sitting on the steps of a palace, but a few rods away from the crowded thoroughfare, an old man playing upon a violin. By the side of him was a little boy, who held upon his knee a misshapen hat, which was probably to serve as a contribution box, but in which there was not a single coin; for his audience was composed of a few lazy lazzaroni and some boys in tattered clothes. When he saw the old man playing the violin he was more bewildered than ever, for the instrument did not produce the tones of a violin. He stepped forward and to his amazement saw that the instrument was made of tin. The old minstrel seemed pleased that he, at least, had one genuine listener, so he began to rub his bow vigorously with a piece of rosin, preparatory to beginning again, when the stranger stopped him and said, "What is that my friend?" "Why it is a violin as you can see, signor," answered the old man, in an injured tone. "Yes, to be sure," continued the stranger, who understood the thought of the old artist and did not wish to wound his feelings, "it is a violin, but a most extraordinary one. Will you allow me to look at it?"

The old man handed it to him, with rather a dejected look common to paupers.

After the stranger had thoroughly examined it he asked, "How did you get the idea of having a violin made of tin," for it was really made of tin. "Papa made it," proudly spoke up the little boy.

"Yes," answered the old man, "it was the child's father, my son, who made it."

"We were very poor, I had learned to play the violin when I was very young; so I said one day, if I only had a violin I could play in the streets and help my son support his large family. He was a tinner and earned only small wages. We had no money to buy one, so my son who is no fool, began to make one out of the worthless clippings of the shop. It took him a long time, but at last it was done; and he brought it home one evening."

"Yes, I understand," interrupted the stranger stretching out his hand to take the bow. "Will you allow me to try it?"

The old man handed him the bow. Then the stranger began to tune it. It would seem that he did it skillfully, for the old man remarked smilingly, "Ah, you are one of the trade too?"

"Just a bit," was the answer. As the violin was now tuned, he placed it in position, gave one stroke of the bow so masterly, that the old man and even the children, looked on in astonishment (for in Italy every one is an artist by instinct).

After a short prelude, the eccentric looking man was transfigured. The lines about his mouth became sharper and deeper, and as he played he seemed to forget both the place where he was and the people who had begun to surround him; for he gave up his whole soul to the breath of inspiration.

In the meantime the carriages continued to roll toward the palace, whither they were taking all the aristocracy of Naples.

The crowd that had gathered at the entrance of the Via Frattina attracted the attention of a lady in her carriage, who recognized the artist, whom she was going to the Palace to hear. She stretched out her arm, exclaiming, "Paganini." From that instant the crowd increased. The news was transmitted from carriage to carriage, that Paganini was there playing in the street. Forthwith the carriages were emptied, and noble ladies in silks and laces, rushed forward where Paganini in the glow of inspiration improvised upon the tin violin.

He improvised upon the story that the old man had given him. Sometimes his violin wept, sometimes it seemed to think. Then a melody as sweet as a dream of the Orient, spoke of the hopes of the old man. Paganini was, perhaps, never greater than on this occasion, when his genius was borne aloft on the wings of charity, soared above the wondering multitude.

As he finished, he took the misshapen hat and handing it to the child, motioned for him to begin the collection, and while the boy was going from one to another of the fine ladies, soliciting an offering, the artist had again taken up the peculiar instrument and was improvising a melody, not sombre or brilliant, but soft and gentle as a prayer, and it was so well understood, that gold coins were soon mingling with silver, until the old man possessed a veritable fortune.

Paganini then returned to him his violin, and shaking his hand, departed in the midst of a murmur of praises, which followed him even within the palace.

WORTH CONSIDERING.

After two or three years of study in Europe between which their friends hear wonderful stories of their advancement, the pianists and the fiddlers pass through their allotted time of instruction. Usually they are eager to make an appearance abroad, and as this costs very much less in Germany than it does in this country, they are generally successful. They play in a Berlin music hall before an audience of fellow-students, deadheads all of them, and a few critics who will group this performer along with half a dozen others in a paragraph next day and mention very little more than their names and their teacher. Sometimes, through conditions which are not always easy to define, they may get several sentences of flattering description all to themselves, which are promptly printed in a neat little pamphlet and brought back to this country for the delight of their friends and the enlightenment of those whose business it is to know what good piano playing should be. Most of them are benighted enough to believe that on the strength of that appearance, combined with a letter of recommendation from their teacher and a few untrustworthy or trival phrases of criticism, they may return to the United States and begin here the accomplishment of their wishes.

Disenchantment comes so soon after their return that it is lucky for them they have enjoyed a few happy hours of illusion. The young woman arrives here with her hopes and her criticisms. The first thing she does is to seek a musical agent, who regards her from the moment he lays eyes on her first as legitimate prey from whom he is to squeeze every possible cent. To her surprise, she soon discovers that there is to be no compensation for her appearances, and she is lucky if she is able to find a place, even in a concert bill, without being compelled to pay for it. It very rarely happens that anything is accomplished through the first agent. The experience is likely to be profitable to him, but in despair the applicant goes to a second one. Of course, more money is paid to him for advancing her interests, but it rarely happens that she is ever able to get an engagement that pays her a cent. If her money holds out she goes to another agent, but if it doesn't she is likely to keep out of sight of the public until she manages by social influence or some other to play gratuitously at a concert.

It rarely happens that a woman pianist is ever in demand, whatever the degree of her merit may be, short of the very greatest of her kind, and it is only a short time before the virtuoso who was coming back to our own land to enjoy such triumphs to the delight of her family and her own enrichment, settles quietly down to the business of teaching, and is glad to get pupils. And that life starts a new kind of drudgery for her. This is the experience nine out of ten American students who go abroad and study have to encounter. The case of the woman pianist is selected because that is possibly a little harder than most of the others. But in every class there is the same disappointment, and men and women undergo the same difficulty.

Music that brings sweet sleep down from the blissful skies.—*Tennyson.*

THE Teachers' Forum

Conducted by N. J. COREY

This department is inaugurated for the purpose of uniting the many teachers who read THE MUSICIAN in a bond of professional brotherhood. It is to be their medium for the interchange of ideas, experiences, encouragement, discouragement and difficulties. The fullest correspondence is invited. The questions will be answered and suggestions given by the conductor and the contributions of those who wish to gain new light or to present their methods will be printed. We propose helping ever teacher who will permit us to do so; we intend to do everything possible to overcome the isolation with which you are burdened. Will you co-operate with us?

No conditions are attached; the department is open to *all* MUSICIAN subscribers. Address all communications to the Teachers' Forum, care THE MUSICIAN, Eighth and Locust Streets, Philadelphia, Pa. Do not hesitate, but be among the first to ask help, or to give some other teacher a suggestion. Let us know what you would like to have treated in its columns.—Editor of THE MUSICIAN.

"The gates of art are closed unto none; who so entereth thereat, though he seeketh perfection, yet shall he not find it."

—Ancient Egyptian Papyrus, 3580 B. C.

MUSIC AND INTELLECTUAL GROWTH.

The following questions have been received:

(*a*) "A great deal is said of mind in music. How does music or the study of music tend to intellectual growth, or how is the mind used in music?

(*b*) Will you tell me of a good collection of not over fifteen pieces in the third or fourth grade, that would be pleasing to a boy? Preferably the work of one composer, as Scharwenka."

In reply to the first question, it might almost justly be said, that judging by the results of a great deal of the teaching that comes under one's observation, the mind is used very little in music. That is, among some teachers and pupils, and it is a very sufficient reason for their lack of progress. Pupils practically pay no attention to the instruction they receive, indeed, they sit with their faculties nearly dormant, and are equally negligent in the preparation of their lessons when by themselves. To them music is nothing more than a matter of notes, keys and fingers. The fact of its being in reality one of clear and concise mental action seems to be an idea far above their comprehension. There is a large class of humanity with whom mental inertia seems to be a permanent affliction. Oftentimes they cannot be accused of being physically lazy; they may be decidedly active in their tendencies and life, and yet are painfully averse to mental effort. If you want to exhaust the average man, give him some task that requires the exertion of a considerable mental energy, and observe how quickly he will succumb to the strain. The brain is an instrument that cannot be effectively used without training. Its various faculties are singularly unruly unless they have long been held in check and carefully directed in their operations.

As to the use of the mind in music, it may be said, whether in the line of training or of direct application of its energies, that it is used in exactly the same way as in any other study. Whatever is accomplished by the hand must have been first accomplished by the brain. No work that is not the result of mental action can properly be called work at all. Even if there be an apparent result, it is, very likely, nothing more than the result of a sort of automatic imitation. The same mental qualities that insure success in any other study are also essential in music. The primary requisites are attention, concentration and comprehension on the part of the pupil, and clarity, conciseness and precision on the part of the teacher. Attention and concentration are two fundamental faculties of the brain that work in conjunction. No result can be produced without close and undivided attention, and in order that it should be effective, all the faculties concerned must be directly concentrated in the effort. Through this there can come a comprehension of the work in hand, and from it all some sort of result that will be worthy. The various departments of music study give a discipline to these faculties that is excelled in no other department. This is none the less true from the fact that it is not generally known by the public at large. The attitude of the general public, while constantly improving, still remains on a low plane of understanding. Nothing is more common than the surprise manifested by students, on getting fairly launched in a course of music study, at the immense demands made upon the intellectual faculties. If they took up the study of music expecting it to be a smooth pathway exacting little of their mental energies, it was not long before they discovered their mistake. Any amount of technical work undirected by mental energy does not result in satisfactory work, but only produces a mere body without soul, an unformed mass, which being without cause is equally without effect.

On the theoretical side of study, the mazes of harmony, counterpoint, and the other higher branches prove a puzzle to the brain of the student which is not unlike that involved in the study of the higher mathematics. The dabbler can soon be discovered when such a course of study is begun. Many students begin the study of harmony with the vain delusion that it will be only a simple amusement, but only to be quickly routed by the prospect of hardships before them. For the discipline of the mental faculties no study is more efficacious. There is nothing that occasions a greater demand upon the attention than the working out of the exercises in harmony and counterpoint. Does the average music student ever stop to think of the tremendous mental endowment needed in the composition of the higher forms of music? Take, for example, the wild chorus of Valkyries from Wagner's "Valkyrie." The nine Valkyrie sisters each singing as many separate and individual parts, each different from all the others, while ranged along with these in the orchestral score are anywhere from twenty to thirty parts for the different instruments, shooting about in every direction and forming one vast sonorous surge of sound. In such compositions anywhere from twenty to forty lines of music staff are placed one above the other, and all performed at once. It is impossible to play the music on the pianoforte, or even to "see how it goes," the best arrangements being obliged to discard three-quarters of it. Only in the brain of the composer can it be conceived and written down, and it can only be first actually realized when it is performed with the orchestra and chorus. To read such a score is far beyond the abilities of any but the most highly trained musicians, to say nothing of the ability required in its composition. A little study in this direction will imbue any student with a most profound respect for the mental capacities of the great composers, and dissipate whatever share he may have had in the popular delusion as to the mental incapacity of musicians, or of the lack of opportunities for mental growth among those who seriously take up the study of music.

The mind is developed not alone along the lines of actual work, but through the various studies that are akin to music. Musical literature and the study of musical form lead one afar among the nations, and open constantly widening fields of mental contact. Passing on to musical æsthetics, the entire region of art and all its branches is opened up to the aspiring student. The musician joins hands with the painter, the sculptor, the poet, and the dramatic artist, and mental vision constantly widens. There is no study that does not open up innumerable side avenues of thought, and stimulate numberless apparently indirect activities, but no one study does this to a greater extent than music. Mechanical, scientific, artistic, æsthetic, emotional, the range is practically unlimited. All things feed it and it is a part of all things. The intelligence of the pupil should be stimulated from the very first lesson, no step being taken that is not actuated by the mind, and thus everything will be rendered subservient to mental development. It should be the endeavor to make something of the pupil other than a mere automaton. This is doubtless a long process, and can only be accomplished through long and patient perseverance on the part of both pupil and teacher, and it is only too true that the majority of pupils cease their efforts before they arrive at any point that leaves them in any way musically independent. How many players do we find that are unable to form any sort of intelligent conception of a new composition that is placed before them. They have to be shown the correct method of performance in every detail. This implies a state of mental helplessness that is as deplorable as it is needless. It comes from a one-sided training of the faculties in which the power of understanding, or the ability to grasp the meaning of musical phrases and form a conception of their proper rendering, is left sadly undeveloped. I think I have said enough to hint at least that the field for mental development in music is practically unlimited, and that the mind is used in music to produce each and every result that is of any value.

As regards the second question, it is one of the sort that it is quite impossible to answer. The problem of selecting music for pupils is one that troubles nearly all teachers. Some have settled it more or less to their satisfaction, but it seems to be one that it is difficult to hand on to another, so different are the needs of individual teachers. Many questions of this sort are received, showing that there is a field for a good graded list of teaching pieces. I have seen one or two of such lists, but they have been almost entirely made up of classical music, and giving but little help in providing for the needs of teachers removed from the more educated centres, who find it impossible to give but a limited amount of such music to their pupils. The crude and undeveloped taste needs to be led along by degrees. It is useless to expect it to grasp the highest class of music without previous preparation. The first literature provided for infants is of the Mother Goose order, a higher class being furnished as the mental faculties grow. Musical infants need similar treatment, and musically considered, many grown up people are the merest and most undeveloped sort of infants. Their capacities vary with the opportunities that they have enjoyed for listening to music. Therefore, in recommending music that would be "pleasing to a boy," it would be necessary to first catch the boy and find out what sort of music he could assimilate. Furthermore, it would be detrimental to the boy's mental and musical growth to provide him with music of a single composer. Nothing could better conduce to make him one-sided, and that is what the teacher wishes to avoid. He should be given music from various composers. As to the recommendation of books, that belongs more properly to the business department. Nearly all music houses publish such books. Look through the advertising pages of THE MUSICIAN, and write to the publishers and find out what arrangements they are willing to make to send their books on inspection, and in that way teachers can make up a list of such books as they will find adapted to their several needs. Lists of graded pieces have appeared from time to time in THE MUSICIAN, but as all teachers are not possessed of back numbers, if they could make their wants felt by the publishers, the latter would doubtless prepare such lists and place them on the market.

It is impossible to print all letters in full, on account of the lack of space, but inquirers are invited to express themselves fully in order that a complete understanding of their position may be obtained. Such portions of the letters as are most essential in stating the inquirer's position will be printed. The following excerpt may open up a question that many teachers are thinking about.

(*a*) "As to the different methods you wrote about. How shall one get information about them and gain an idea of their system of work? Have those different schools any literature or methods that can be secured by those who are not pupils? (*b*) May I ask your advice as to a musical kindergarten? On what principle does the Burrowes school work and can that be attained by home study? What musical kindergarten do you prefer? (*c*) Should one use the same studies for the reed organ as for the piano?"

The only way a person can gain an idea of the various systems of instruction is to obtain the books and study them, and then if they are not understood, to follow this up with a letter to the authors. It is not within the province of a magazine of the nature of THE MUSICIAN to explain the various systems, pleasant though it might be for the journal to thus accommodate its patrons. The addresses of the authors of the various systems can always be found through the publishing houses.

As to the various kindergarten methods, I can only say that I am very impartial and prefer them all best. I have had no occasion to use any one of them in my own work, and therefore have given no one of them a personal test. I have only talked with their various exponents, and they all seem to have their points of merit. But the answer that I would give to all who wish to investigate the various kindergarten methods,

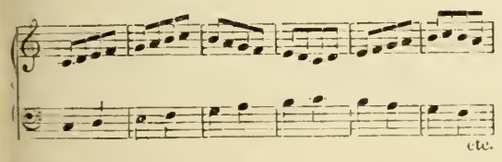
is this :—Make your arrangements to attend the meeting of the Music Teacher's National Association at Put-in-Bay during the first week of next July. Mrs. Parsons, Miss Burrowes and others were at the last meeting and had special parlors in which they explained their systems, and which were thronged with interested inquirers. And they will doubtless be at the next. This is an ideal way in which to compare the different methods, and in addition, enjoy the many opportunities for growth afforded by the concerts, lectures and round tables of the association. The meeting in July was so immensely successful, and the Hotel Victory proved to be such an ideal spot for the holding of such a convention, and the enthusiasm therefore of those in attendance was so great at the delightful manner of taking advantage of the opportunities for musical growths afforded by the association, that the largest meeting known in the history of the association may be safely said to be assured for next July. Therefore, make your plans to get all such questions as this answered by coming where you can investigate for yourselves, and draw your own conclusions as to the adaptability of the various methods to your own particular needs.

The early study of the reed organ should be conducted on exactly the same lines as the pianoforte. The preliminary training of the hand should be the same. Most of first and second grade piano music can be played on the reed organ, but after that it will be necessary to select music that is especially suited for the instrument. It may require some searching to find out where the really good things are published, but one always has to search for the best.

SOME PIANO "TRICKS."

T. L. RICKABY.

This does not sound very poetical nor artistic, and if anything ought to be both artistic and poetical it is piano playing. Yet the fact remains that piano playing consists largely of "tricks" in the usual acceptance of the word. Animals are taught to walk on two legs instead of four, dogs are taught to toss up a piece of meat and catch it as it falls, horses are taught to waltz, and these unusual performances are known as tricks. It has occurred to me that there are a number of tricks taught those poor little animals called music pupils, and a great many which ought to be taught, and in this chapter I intend to mention a few. A trick may be said to be some movement or performance which is not natural, but which has to be forcibly "grafted" onto some subject. In one sense a scale, an arpeggio is a trick. No one does them naturally. Many requiring daily practice for months and conquering only after great labor and often much tribulation. The greatest difficulty that pupils encounter is in making the two hands independent—so as to be able to do one thing with one hand and something different with the other. Take for instance this exercise :



or this :

This has no special technical value, but as a medium of making one hand independent of the other it is very useful. It is not nearly so easy to do as it appears. But every pupil of any advancement ought to be able to do it. Instead of a rhythm of three's (triplets) may be used, for instance :

This to be continued until both hands return to C on "one" as at the beginning. The same exercise may be played by triplets in the left hand. A still more difficult exercise is the following :

These exercises or tricks, as they really are, when mastered serve to render the hands independent, and, of course, give added power to the player. There are tricks, however, which, besides giving increased power, tend to distinctly musical and artistic effects. Players are continually required to play loudly with one hand and at the same time softly with the other. The pianist who charms us by his manner of playing a melody so distinctly musically and at the same time keeps an accompaniment properly subordinated is very liable to be given much credit for material genius and all that. The fact is, that in all probability he has simply taught himself the "trick" of playing loudly with one hand while the other played softly.

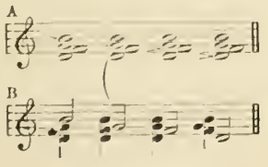
Take any five finger exercise. This, for instance :

This played as indicated, will be a step towards playing with two different degrees of force at the same time. The next example presents still greater difficulties, but compensate one fully by giving increased ability in this direction.

Suppose you were to come across the following chord. It presents no difficulties whatever, played in the usual way:

But learn to play it and other chords with the fingers alone—that is, without any hand weight whatever, but with finger flexion entirely. Beginners and amateurs frequently will be faulty in playing chords by leaving out one or more notes. This is due to the fact that they simply trust to the weight of the hand, so that even if the notes all sound, the chord will not be well balanced, but one or two notes will sound louder than the rest, or what is more probable, one or more notes will not sound at all. In the majority of cases the playing of amateurs is very faulty in this particular—especially in the left hand where accompaniments in chords predominate. Learn the trick of playing chords with the fingers—with a motion like you were picking up—grasping—a handful of keys. Chord playing will become easier, and more correct.

A trick somewhat closely related to this consists of striking a chord in such a way that one note will sound distinctly and sonorously while the others will be subdued.



To play the chords as at (A) practice them as at (B), afterwards striking the whole chord, making every note the same length, but not of the same intensity.

Another trick of pianists is the "glissando"—done by rapidly drawing the fingers over the keys. Of course it can only be done on the white keys. This is one of the "cheap" ornaments of pianists, and I compare it to the "triple tonguing" of the cornetist. It is a "cheap" feature, but one which no performer ought to be ignorant of.

Very few pieces have the "glissando," but once in awhile it can be introduced with good effect, and a well done glissando never fails to please the average listener. A much more difficult, but more effective trick, is the glissando in octaves or sixths. This is done with the nail of the fifth finger, and the ball of the thumb. A glissando in thirds (downwards) occurs in one or two compositions of Liszt. This is quite difficult and an advanced pupil might learn to do it on general principle. It is done with the nails of the second and fourth fingers.

I look upon the trill as nothing more than a trick—one that must be learned by dint of much drudgery. A short trill is often easy of accomplishment, but the long ones—chain trills—are the real test of a player's strength and endurance. Mason's two-finger exercises develop the trill, but it is yet advisable to practice this feature as it usually comes in musical compositions, viz : on two alternate keys. There are several ways of playing a trill : first, by two adjacent fingers, thus :

2 3—2 3 ; 3.4—3 4 ; or 4 5—4.5, or in this way
2.4—2.4 ; 1.3—1.3, etc.

Modern fingering is gradualy undergoing a change, and it is becoming usual to divide a long trill between several fingers, thus :

2 4 3 4—2 4 3 4, or
1 4 2 3—1 4 2 3, etc., etc.

This is quite a trick, but a valuable one. When a trill is performed in this way the fingers do not tire readily, and the ornament can be continued indefinitely—because the labor is divided among a greater number of members.

The piano can be played acceptably without any of these tricks. Quantities of the best music make no such demands on a player. Thousands of people are incapable of conquering the difficulties these features present, and it would be a useless waste of time to attempt to teach them. But there are great numbers of players who are ambitious to a degree. I think they ought certainly give some time to mastering the few mechanical tricks mentioned. Many concert pianists cannot do them. That proves nothing. They are not the best pianists ; the greatest pianists can do all of them, and even if a player never becomes a concert pianist, there is a satisfaction in conquering difficulties, which has a charm to most people.

A great deal of piano playing—and good piano playing—can be done, and is done, by people who cannot do any of the various tricks which I have mentioned. But I would particularly emphasize this fact: They are all worth while, being good discipline for fingers and wrists, and to be a fine pianist it is necessary that they be mastered. Now, how many of them can you do, to your satisfaction or that of your teacher?

THE MUSES.

The Muses held a gala day
On Hel'con's starry height.
Old Time was charmed, while on his way,
E'en Century lingered with delight.

I crave, he said, before I leave,
One boon, a genius for fair Earth,
Who will in sympathy receive
The master's thoughts, as at their birth.

Give voice to them in spinnet's power,
Spontaneously as flowing streams,
With music rare, bewitch the hour,
In harmony's enduring themes.

So multitudes shall press to hear,
And stand entranced, all hushed and still,
As rippling tones fall on the ear,
Or thunder at the artist's will.

The gods are ofttimes vainly sought,
By prayers, without an effort made,
But genius has forever wrought,
To wear a crown that does not fade.

Old Century's boon was granted soon,
From out the white heat of the fire,
As one appeared, who could attune,
To mortal ear, Apollo's lyre.

The world resounds with loud acclaim,
For him the Muses sought and found ;
'Tis Paderewski, known to fame
With laurels, by old Century crowned !

Those who try to do something and fail are infinitely better than those who try to do nothing and beautifully succeed.—*Jenkin Lloyd Jones.*

Expert Opinions

Anent "A Critique and Some Comments Thereon."

Art and Business.

In the April MUSICIAN was printed an article by T. L. Rickaby opening a symposium on the average concert criticism. This was followed, in May, June, July and August by excellent articles. Two excellent articles are contributed to this discussion this month.

To the May number Mr. Rickaby, who seems especially able to launch interesting discussions, contributed an article on "Business or Profession, Which?" This subject receives attention under the caption of "Art and Business." These articles will be followed by others. We will be pleased to hear from our readers generally.
—Editor of THE MUSICIAN.

"A CRITIQUE AND SOME COMMENTS THEREON."

Editor of THE MUSICIAN.

Dear Sir—In my opinion, the object of a concert should not exclusively be the exchange of money and entertainment, but should also include the education of the musical appreciation of the listener to the highest degree attainable, and enable him to understand and enjoy the best music by the greatest composers.

A majority of those who attend concerts expect to hear that which will afford them pleasure, although unable to appreciate music, which, as they express it, "Does not have a tune to it." In other words, selections which do not consist of some well-known melodies, or some simple rhythms of the waltz and march order are not likely to please them.

To such the Fugues of Bach, Sonatas of Haydn, Mozart and Beethoven, Rhapsodies of Brahms, Concertos of Henselt, Mendelssohn, Chopin, etc., sound about as musical as the buzz of a dentist's drill. Bill Nye undoubtedly expressed their sentiments when he said, "The good thing about classical music is it is really so much better than it sounds."

Another class who attend concerts comprises those whose appreciation is above hackneyed melodies and commonplace rhythms of the dance order, and yet they do not relish contrapuntal discussions in canon form. They do not care to follow a composer's development of motives, nor are they captivated by the painful efforts of some of our modern composers as they try to be original rather than musical. Nevertheless, they thoroughly enjoy good music and do not consider it necessary to inquire whether the composer is living or dead, a foreigner or an American, before they can take pleasure in listening to it.

Let us hope there are many of this class, who are like one of the singers in one of the large New England city churches, who said to the writer, "I am glad I know just enough about music to enjoy it, and not enough to criticise it."

There is still a third class, who are cultured musicians, and are able to discerns all of the beauties of classical music which someone has defined as, "Beautiful thoughts beautifully expressed," while they regard popular music in about the same way as Washington Irving would value Mother Goose stories. Is it not unjust to both the first and third classes to take their money and then treat them to music which is entirely over the heads of one class and under the feet of the other?

The next question is, can the performer get the consent of his musical nature and artistic conscience to render music all the way from Georgia Camp Meeting to Cat's Fugue, for the sake of satisfying a three-cornered audience? Should he do so, he will probably subject himself to a caudle lecture by the critics, but he can bind up the wounds inflicted on him by these knowing ones, with the comforting facts that they are finding fault with that which they generally do not have to pay for, and as some one has said, "You know who the critics are—they are those who have failed in Literature and Art."

It should be remembered that it is not the best way to interest children in the study of literature, to read to them only from Shakespeare and Milton. Neither should it be beneath a great scholar or statesman to speak in language simple enough to be understood by the plain people, and it may be better for the musician to brave a scoring from the critic than the murmuring of the multitude.

As a solution of this problem, the writer would suggest a three part program as follows:

PART I.

Music consisting of popular melodies and simple rhythms of the waltz and march order.

PART II.

Introducing descriptive, suggestive and poetical music.

PART III.

Classical music.

This program, like New England weather, should be subject to change.

In conclusion, I wish to endorse all that was said in the article in opposition to the introduction of selections which bring out the squeaky qualities of the violin and the technical display of the voice, and it would be a great relief if we could occasionally hear a singer who did not seem to think that his or her engagement to sing in the angel choir depended on a constant use of the vibrato, resulting in a perpetual singing out of tune. Very truly,

DURHAM, N. C. GILMORE WARD BRYANT.

Editor of THE MUSICIAN.

It seems to me that this editor has given candid, though perhaps somewhat exaggerated and too forceful expression to what must often be felt by audiences representative of the "general public," when attending performances of advanced music.

The well-meaning expressions of approval, and even enthusiastic praise often uttered by those who feel that they should encourage and give the support of their influence, although they may not have had opportunities to prepare themselves for proper appreciation, are misleading. The artists and those who provide music for the wants of the public, take them as representative of the desires of the people as to what they like to hear, and make their provision accordingly.

The best of literature is not truly appreciated by the masses. How, then, should good music be, which is so much more of an abstraction? Even on the part of those best qualified, these things require the best efforts of the mind in order that the germ thought may always be perceived and its logical development understood. For musicians music is logical. It is truth; if not, it is not art. But let us not forget that those who come to hear at the evening concert, have put forth *their* best mental efforts during the day in their various avocations, and are in condition to receive only that which is entertaining and restful.

Persons who, in their youth, were privileged to have five or six years of good musical instruction, or who, like Beethoven, had constant musical environment from early childhood, would not have failed to enjoy this music and to be greatly uplifted by it.

Our editor is evidently in his musical childhood, as hundreds of other good people are. Now let any musician think back to his own musical childhood, when he delighted in "Money Musk," etc., how, after a time those things became hackneyed and commonplace to him; how he went on discovering new and greater beauties; the immensity of the route which he had to traverse before he really began to enjoy truly noble music. Or, if he is a teacher of some experience, let him think of what he is compelled to lead students through before they arrive at genuine appreciation of the masterworks. He will not, I think, expect the average audience to go into ecstacy over the monumental works of musical art.

Our concerts, frequent as they are, are too few and far between, and too diverse in their nature to accomplish the results which seem to have been expected of them in the town in question.

And this is true of the musical festivals in some towns. For a whole year the people hear practically no music and there comes a deluge. The bill of fare usually provided would, indeed, prove too much for most musicians if, perchance, they had had no previous acquaintance with the works.

We are, however, as a people, coming more and more into the enjoyment of the good things in music. Disclosures like those of this editor should lead us to more consistent efforts in order that we may be yet more successful.

Educating the public is, after all, very much like teaching a little child. We must proceed from the known to the unknown, from the simple to the complex. A teacher may have in mind the highest possibilities for a child he is beginning to instruct, but he will hardly put Milton's "Paradise Lost" before him, because that is a great work, and far less will he expect the child to feel and express admiration for the great epic.

It is not within the possibility of the average mortal to think after them, in a moment as it were, the thoughts of the world's great ones, be they literature, sculptors, painters or "only" musicians.

The best of all products of the mind come to their largest appreciation in the quiet apartments of students and thinkers.

And yet these works are a rich heritage for the public of the future, into which it will come when the leaders are far in advance, occupied with achievements yet unheard of.

COLUMBIA, S. C. ERNST BROCKMANN.

ART AND BUSINESS.

Editor of THE MUSICIAN.

Dear Sir—All existing arts have, and always have had, certain definite, recognized standards. An attempt to lower these standards for gain, is prostituting art to so low a level, that it ceases to be art and becomes trade.

We may retain our ideals in the practice of our chosen art as a profession, so long as we make no concession to expediency.

It is not degrading to practice art as a profession, but is humiliating when the artist is forced to haggle with a patron who desires the benefit of the art. It becomes degrading, however, when the artist lends himself to meretricious methods, such as prevailing fads, for instance, and instils into the untrained mind of the prospective patron, the assurance that artistic results will be arrived at in spite of inartistic methods. Such so called artists may acquire wealth through these means, but it all amounts to common robbery.

And until art is elevated to the high plane, which cultivation of a broad and universal character establishes, the law will not recognize such acts as felony. The untrained eye and ear of the laity are influenced largely by fashion, by the mis-use of popular vagaries, and the self-assertions of Art's immature votaries.

Until the artist himself values his Art as highly as he does his honor, his moral character; until the highest personal equation is measured against the most cultured taste, "Art and Business" will fail to harmonize.

The school in which art-studies are pursued, has much to do with the developing or relaxing of art-instincts. It is the standard, *always* the standard set, and the attitude of the instructor, which gives the tone to the student's aspiration and marks the height toward which to climb. If a diploma and graduation is the attitude desired, the art and its emolument may be harmonized very easily. If it be "Art for Art's sake," the *highest* degree of skill and craftmanship obtainable, then consider not the number of your fellow-pupils, nor the size of the seal on your diplomas. Resist the injudicious praise of foolish and inconsiderate friends; cultivate the friendship of those, recognized not as clean money getters, but as true leaders in the highest sense of the art they profess.

On the other hand, one's art should not be cheapened by giving gratuitously to the public, the skill and knowledge which it has cost years and countless sacrifices to acquire. It is an injustice—not only to yourself, but to the profession at large. We have had, this winter, in many of our largest cities, and so called musical centers, the sad spectacle of empty seats at concerts where the greatest artists appeared. Our dear public has become so surfeited with musical

entertainments, provided not only gratis, but where the tickets actually go begging, and the discrimination to judge such affairs from their proper viewpoint being entirely lacking, therefrom results, for the great artist, bitter discouragement and disappointment.

The "laborer is worthy of his hire"—only we should remember, while prosecuting the study of one especial art, or while practicing it, that "Seraphs share with their knowledge, but Art, oh Man! is thine alone!"

CHICAGO. REGINA WATSON.

THE UNMUSICAL CHILD.

M. ELIZABETH LUGER.

In this age of precocious intellect and improved school systems, there is a growing tendency amongst American parents to permit their children to follow the inclination of their own taste in choosing what they shall study. The child of to-day, in many instances, has become his own taskmaster; the parent is but the provider. A condition of affairs far removed from that old-fashioned iron-clad government which characterized the education of our forefathers. Nor is the new code inadequate when the youthful taskmaster is naturally ambitious and possessed of a wholesome thirst for knowledge. But it is wholly out of proportion in relation to a less gifted child.

In their early training, children should be introduced to Art and Science. They should be given, as it were, a sort of birds-eye view of knowledge to prepare them in later life for a closer acquaintance with that particular branch which most appeals to their own peculiar disposition. What teacher is not often vexed by some anxious parent. "Do you think it worth while to make So-and-So take music lessons? She isn't a bit musical." And then the teacher falls back upon the curriculum of his own knowledge and asks himself, "Is it worth while to expend all the time and energy to instruct an unmusical pupil? Is it wise to demand of that child the study of an art for which it has no especial aptitude?" The long hours of practice are freighted with weariness for even the most devout worshippers of music, and infinitely more heavy burdened are they for one who is not filled with this love and appreciation.

Thank Heaven, unmusical children are few and to the parents of such an unfortunate there can be but one reply, "Teach it music by all means, teach it to sing if a lifetime is required to learn one song, teach it to go beyond the sordid rattle and din of life and listen to the harmonious breath of nature. Teach it to seek and love the Beautiful. The little one whose heart is filled with an intense love for music can better afford to miss music lessons than its unmusical brother, for genius ever has and ever will, find a way to assist itself. You may smother the song, but you cannot stifle the inexplainable sense which inspired it.

The child whose ear is deaf to all the wondrous power of music is more to be pitied than one born with sightless eyes. Deprived of sight there still remains mysteriously grand and inspiring tones to guide one to the Beautiful and True, but without an appreciation of music there can be no access to true knowledge, for the guide-posts thence are intelligible only to the sensitive soul which vibrates to the touch of music. In the natural order of things, childhood and music are as closely allied as birds and blossoms; they are each a part of Springtime. The bright and healthy child, like the baby robin, discovers the crumbs of wisdom scattered abroad by the Sages and selects his own song notes from Nature's glorious Symphony.

Most of these so-called unmusical children are merely indolent or stupid. If the former, then work, pure and simple, is what they require to inculcate habits of energy and ambition and the discipline of daily practice, under the supervision of a competent teacher, is a most valuable tonic for such laggards. If the child is stupid and dull, then certainly there is nothing better qualified to awaken his lethargic perceptions than the study of music. It has power to quicken and broaden the mind beyond the study of any other art. The effort necessary to learn even the rudiments cannot but serve to stimulate the mind, and the concentration necessary to memorize a composition is of the utmost benefit to one who is not possessed of a keen and retentive ear. If a child be naturally dull of comprehension, he will never become bright unless he is compelled to study. Education is his only hope of enlightenment and music is the very breath of education. It is the foundation of character.

What mother would hesitate to seek medical advice if she discovered in her child any symptoms of impaired health? She would not pause to ask any one if it be worth while to strengthen the ailing body. She would straightway consult a physician and following minutely his prescribed treatment, she would not rest content until the child be restored to perfect health. Yet many of these same mothers allow their children to grow up with weakly, ill-formed minds, with never even a thought of pity for their lamentable condition. Yet it is infinitely more essential to provide children with strong and beautiful minds than to bestow upon them grace and beauty of form.

If they do not possess an inherent taste for the ideal, then by all means it is necessary to cultivate that taste. As the delicate, well-directed strokes of the masseur will reduce irregularity of feature to comeliness and beauty just so will the patient pursuit of music beautify the intelligence. He who lacks a noble mind has been cheated of God's choicest inheritance, and nothing that might serve to enlighten and elevate such an unfortunate child should be considered useless or unwise. Better let him feed upon the coarsest viands and clothe him in the humblest raiment than to starve his mind, for that mind is his all and it is to be his forever.

In later years when the days of his plastic youth have passed, he may strive all in vain to fill the immense void for which his parents, through sheer thoughtlessness, are responsible.

But perhaps the child is neither indolent or stupid and yet not musical. It may be that he is bright and healthy and still does not sing or play. Ah! because a child evinces no great love or talent for music, it is no proof that he does not possess a wealth of melody within his little soul. Environment exerts a most powerful influence over children, and it is possible that his surroundings are not in harmony with the tone of his song. Ofttimes the bird with the sweetest song will refuse to sing a note when it is held a captive.

That child whose environment is out of rhythm will necessarily remain dumb to the music of his own soul until something transpires to set that soul into vibration. Transplant him to a musical atmosphere, provide him with the best teacher you can procure. One who will teach him music in its truest sense, not only notes and signs, but the deep underlying thoughts of which these are the outward form. One who will cause him to reflect upon the immeasurable pathos of life and send him into the woods to listen to the hum of butterflies and the twitter of birds. To make him understand that the drudgery of daily practice is but a foretaste of the sacrifice and self-denial with which he must purchase everything that is worth having, and that patience and perseverance are the only pathways to success.

To teach him that the same perfect control of mind and muscle necessary to the rendition of a musical composition will be required in every walk of life. To teach him that his little mind is a kingdom large enough to contain all the happiness of the entire world. This is the mission of the music teacher, and if the daily practice does not tend to this end, then surely it is not worth while for the unmusical child to take lessons.

Build thee more stately mansions, oh, my soul,
As the swift seasons roll!
Leave thy low-vaulted past!
Let each new temple, nobler than the last,
Shut thee from heaven with a dome more vast,
Till thou at length art free,
Leaving thine outgrown shell by life's unresting sea.
—*Oliver Wendell Holmes.*

"Mind is the great lever of all things."

"No outlook is worth much unless it is also an uplook."

Each stage in life forms a terrace from which the next step higher can be reached.—*Henry Wood.*

Recreation is intended for the mind as whetting is to the scythe. He, therefore, that spends his whole time in recreation is ever whetting, never mowing, and he that always toils and never recreates is always mowing, never whetting.—*Bishop Hall.*

All children of the earth are very much in touch with us; affecting all our interests, though we do not perceive the course of this activity. And does not this hint to you of the importance of directing your energies for world-wide measures, thus enlarging your whole life?—*Fred Burry's Journal.*

MUSICAL BIOGRAPHY: ITS IMPORTANCE.

LAWRENCE ERB.

The lack of accurate biographical knowledge among musicians and music-students has for many years been apparent. The *names* of prominent musicians have been household words, but their lives, characters, and personalities have been as little known as though they had lived a thousand years ago, instead of within two hundred years, as in the case with nearly all. The average school-boy of 15 knows more about Julius Cæsar or Alexander the Great than the average musician knows about Bach, or Haydn. This humiliating state of affairs has set progressive teachers to thinking, and, in many cases, taking steps to prevent a similar condition among the rising generation. As with many another neglected branch of learning, there are important reasons for the study of Musical Biography, a few of which appear in the course of this article.

In the first place, the study of Musical Biography is important for the sake of our art. Music stands pre-eminent, the most intimate expression in the realm of Art of which the emotional nature is capable. No other art appeals so simply, yet so directly to the heart of man. It should follow that the devotees of such an art should, if they have its welfare at heart, be well-grounded in its principles. To attain this end I know of no better way than to study the lives and works of the men who have made it what it is.

We musicians, who are a sensitive folk, are often greatly incensed with the world at large for its patronizing attitude towards us. We have only ourselves to blame. When we take our art as seriously as the doctor or the lawyer takes his profession; when we treat our art as though it were worth spending a little time on for some other purpose than to evoke musical sounds from an instrument or to make money; when, in other words, we realize that music is older than any other art, profession, or science, and act according to our knowledge, our art will take its place, as it should, ahead of every other profession, the ministry alone excepted.

We make too much of technique. Technique is simply a means to an end—that end is the interpretation of Art-works. Now, how is it possible to interpret a man's works sympathetically, unless we know something about *him*—his ideals, his attitude to his art? It is presumption to treat an art-work in any other way.

The study of biography is an inspiration. No one can estimate the uplifting influence of lives like Abraham Lincoln's, for instance. Some men's lives are more helpful than others, but it seems impossible to study the career of any great personage without deriving some good beyond the information obtained. How inspiring to the striving young musician are the lives of the great masters. The unswerving loyalty to ideals, the passionate devotion to the highest things, which characterize these men are as worthy the Homeric muse as any deeds of legendary heroes. We musicians have a glorious heritage, if we will but receive it.

The objection might here be raised, that Musical History rather than Musical Biography should be the subject studied. To this, I reply, that History is simply Biography in the abstract—the Biography, as it were, of movements and conditions, rather than of men. If the Biography course be sufficiently comprehensive, it cannot fail to include all the important historical events, with the added advantage that it is *concrete* history rather than an *abstract*. Musical History is, as a rule, too much given up to dry discussions of ancient instruments and modes and too little of the men who made or used them.

On the other hand, how many a beginner, with the world to conquer and only himself to do the work, has been spurred on and sustained by the thought of the hard fight with adversity which has been the lot of nearly every great musician. Every one of us has, I am sure, felt this inspiration.

Let us then as earnest musicians give serious attention to this phase of our art. Those who are instructors in schools or colleges should see to it that a course in Musical Biography is made an important part of the curriculum. Surely we should be loath to admit that Shakespeare or Milton were greater geniuses than Bach or Handel. Yet our common school courses include biographical study of poets, authors, philosophers, statesmen, scientists—everything *but* musicians. Here is a state of affairs that *we* must remedy; and the only way we can do it is by making others believe, as we believe, that ours is the greatest of all the arts.

"IT IS THE MISTAKES THAT EDUCATE."

PERLEE V. JERVIS.

In so far as it relates to piano study, the statement that "it is the mistakes that educate," I believe to be a thoroughly false and pernicious doctrine. The only thing that I could ever discover that the pupil learned by making mistakes, was that she had wasted the time used in making them, sometimes she does not even discover that. There should be no mistakes, and with logical methods of teaching there need be none. The trouble is that many teachers and pupils are so interested in the study of *music*, that they never give any thought to the study of *mind*. We do not go back far enough; before the pupil is allowed to move a finger even, the training of the mind should be commenced and the pupil taught to concentrate the mind and think, think, THINK, and at every lesson, during the practice hour, and at all times thought should *always* precede action. If one can think an exercise or passage through clearly, deliberately, slowly and straight, he can always play it without a mistake.

"Aye, there's the rub," some teacher exclaims, "*if* I could make the pupil think, all this would be true." Well, you *can* make any pupil think (idiots and insane excepted) if you go about it in the right way; the trouble is we do not go about it in the right way. How many teachers at every lesson give training in thinking and concentration separate and apart from music study and insist upon regular daily practice in mind control? Yet such training and practice should form as indispensable a part of music study as the training of the fingers. What most players need is more thinking and less playing; think a passage through ten times and play it once, then that one performance if conducted slowly and thoughtfully enough will be without mistake.

How shall we train our pupils to think?

Mr. A. K. Virgil has devised some invaluable exercises for developing the power of concentration and mind control. Through his courtesy, I am able to give two of them to the readers of THE MUSICIAN. The first of these exercises he calls "brain technic." Let the pupil take the triad C, E, G, and closing the eyes recite aloud the letters in the following order: C, E, G; C, G, E; E, C, G; E, G, C; G, C, E; G, E, C; then take the triad on the 2d degree of the scale D, F, A; D, A, F, etc.; follow this by the triads of E, F, G, A, B, reciting the letters always in precisely the same order, which it will be seen is: 1-2-3, 1-3-2, 2-1-3, 2-3-1, 3-1-2, 3-2-1. Now set the metronome at 60 and go through all the triads as a continuous exercise, one letter to a beat, strictly in time and without a break. When this can be done without a mistake, increase the speed till 208 is reached, after which return to 60 and recite in triplets, that is, three letters to a beat, and work the speed up as high as possible. Now take the triads in this order; recite the major triads C, F, G, then the minor D, E, A, and lastly the diminished B—all this to be done as a continuous exercise—without a break and strictly in time with the metronome. Next, make the circle of the keys, G, D, A, E, B, etc., reciting always in the same order, viz., major, minor and diminished. When this can be done through the twelve keys as a continuous exercise, take the chord of the 7th and recite in the same order as the triads C, E, G, B♭; C, G, E, B♭, etc., always naming the 7th last, then resolve the 7th to F and recite the 7th chord of that key, resolve this in turn to B♭ and so on through all keys. Take the chord of the 9th and recite in the same manner, C, E, G, B, D, C; C, G, E, B, D, C; E, C, G, B, D, C; E, G, C, B, D, C, etc.; this to be done in all keys.

By the time the pupil can recite all these chords through with the metronome without a break, she has developed to no inconsiderable degree the power of concentration and thought. Now let her go to the keyboard and play, hands together, the five finger passage, C, D, E, F, G, F, E, D, C: Set the metronome at 60, count four and play through in quarter notes; when count one falls on C, change to eighth notes; when it again falls on C, change to triplets; when it again falls on C, change to sixteenths; then go back through triplets, eighths and quarters. Simple as this exercise seems, I have never found any one yet who could play it through strictly in time, without a break, at the first attempt.

Mr. Virgil tells me, that while in Germany, he examined over 500 pupils and did not find one who succeeded the first time through. What is the reason for this failure? Lack of mind control, unclear thinking.

If the reader think the statement of failures exaggerated, let him try this exercise on his pupils or even his fellow teachers, and he will be astonished to find how few people can think straight.

This playing exercise and the chord recitation should be heard at every lesson, and the speed of both be worked up as high as possible. Following this study the pupil should be required to memorize her piece hands separately a phrase at a time, and should always recite the notes, fingering and touch aloud from memory before any attempt is made to play them.

YOUNG COMPOSER'S COLUMN.

RULES

1. MSS. marked "Young Composer's Column" must reach us by the 10th of the month to ensure notice in next issue.
2. Each MS. must bear the full name and address of the writer; the initials will be used unless a *nom de plume* is added.
3. Stamps must be enclosed if MS. is to be returned, but it is to be distinctly understood that the Publishers assume no responsibility for any MS.
4. No charge is made for the examination of any MS., and compositions of any nature may be submitted. The criticisms will be general and of such a nature as will be helpful to those honestly desiring frank and unbiased criticism.
5. No criticisms will be sent through the mail.

W. C. S.—(437-438). We remember your song with pleasure and are glad to have the opportunity of looking over the "Valsette" and "Romance." Both are melodious and distinctly better in harmony and form than the mass of things submitted to this column. Did you ever come across a person who has good manners, who dressed in good taste and in general made a very agreeable impression, but whose efforts at letter writing showed poor spelling, poor capitalizing and poor punctuation? You are very much in that position, musically, yourself; your pieces sound well, but you are either ignorant or careless (we think the latter) when you transfer your music to paper. Are you able to compose a piece without any help from the keyboard? Here are a few instances of faulty spelling—"Valsette": 3d line, 7th meas., D♭ should be C♯; 5th line, 6th meas., B♮ should be C♭; 6th line, 1st meas., E♭ should be D♯; G♮ should be F double sharps; 6th line, 2d meas., A♭ should be G♯; 6th line, 8th meas., C♮ should be B♯; in the Coda (Presto) the F♮'s should all be E♯'s. The "Valsette" is better constructed than "Romance," for the following reasons: In meas. 4 of the latter the melody should have been continued in octaves, at any rate, through the phrase; on page 2, meas. 8, the piece is practically done and the 7 meas. following are entirely superfluous; admitting for the moment that they are *not* superfluous, you can readily see that the authentic cadence coming after seven measures of tonic chord is simply an impertinence. There are no lapses of the sort in "Valsette." We have pointed out some of the slips you make because you are worth taking pains with; you've got good stuff in you. Come again!

R. C. C.—(439-440). "Constancy" is much the better of the two songs. You have considerable melodic inventiveness; your weak spots are: (1) the choice of proper and effective chords and (2) their correct connection when chosen. You've nothing to discourage you and you must take our criticisms as friendly helps. Seventy or eighty miles to the East of your town is a city of 40,000 inhabitants; there must be a good musician there from whom you could get instruction. You make a great many consecutive octaves. Take "Crossing the Bar" at A between melody and bass; at B the same; to carry along the melody and bass at octaves *through a whole phrase* may be correct and effective. The harmony of this song is often commonplace, in that it is mere alternations of tonic and dominant chords in their root positions. You use well-worn progressions and phrases too often; see p. 1, lines 4 and 5. In "Constancy" change the time signature to 4-4 on p. 1, meas. 5 and 6 and in like places; why should you end the song in minor and, further, why should you tack on a postlude in A♭ major? Work hard and let us have something more of yours.

K. O. B.—(441). "Lullaby" is a pleasant, soothing melody and would be very effective when sung by ladies' voices on a moonlit piazza, 'mid odors of roses. It is badly arranged for the voices; why not get some good musician to re-arrange it?

Several compositions by *O. K.* will receive notice when the writer complies with Rule 2.

The Editor wishes to thank *J. P. M.* and *F. E. C.* for letters appreciative of the benefits of this column.

R. S. is informed that his composition, "Idylle," has not been received.

QUESTIONS ANSWERED.

[Under this heading THE MUSICIAN will be pleased to answer any questions submitted by its readers which may be of general interest. *All questions must be accompanied by the full name of the questioner.* Answers will be published without such names. Those who send questions should take care to state clearly what information is wanted. Only such questions as will be of interest to general readers will receive attention in this column. All others will be answered privately, for which purpose stamps should invariably be enclosed.—ED.]

Cantus.—The ecclesiastical modes were called Dorian, beginning on D; Phrygian, E; Lydian, F; Mixolydian, G; Æolian, A; Ionian, C. These are the authentic modes. The plagal modes, whose titles are the same as these with the prefix Hypo, are founded on tones a fourth lower than those here given.

D. H. S.—The Mazurka is a national dance of Poland, deriving its name from Masovia. It originated in songs accompanied with dancing, and was known in the sixteenth century. Chopin, who wrote fifty-two, dignified the mazurka by extending its forms and eliminating all vulgarity.

I. D.—Ossia does not mean easier, although the passages where it is marked are, generally, easier than the original form. The true meaning of the word is "otherwise," or "else." There are examples where the Ossia passage is more difficult than the other form; several may be found in the compositions of Liszt.

Helen B.—Tschaikowsky wrote two operas (perhaps more), "Mazeppa," and "The Maid of Orleans." Neither of these works have been given in America, nor is the music at all known. It is possible they were not successful in Europe, or more would be known of them. His orchestral works and songs are well-known by musicians and take high rank. He was in the United States and led some of his compositions in public.

W. W.—Doppio movimento, means double movement, or twice as fast. Ohne Zuruckhaltang, without retarding the time. The first phrase is Italian, the latter German; see answer to Clarissa.

Charlton.—You do not give the application of the word "stop" in your request for a definition. It may mean the arrangement of levers by which the wind is admitted to certain pipes in an organ; frequently called "draw-stop." A foundation stop is one of 8 ft. pitch. In playing the violin, guitar or mandolin to "stop" is pressing the finger upon the string at appropriate places: "double stop" is pressing two strings at the same time.

Clarissa—The word "ondine" means wave-like, undulating. Ondeggiante (Italian) and Ondulieren (German) have a similar meaning. Ohne is a German word meaning "without."

L. G. D.—Peer Gynt is the title of a drama by Ibsen in which is portrayed the career of an ambitious young man. Eduard Grieg has written music appropriate for the play which is known as the Peer Gynt Suite. It comprises four numbers, viz., Dawn, Anitra's Dance, Death of Asa, and The Gnomes in the hall of the mountain king. In similar style Mendelssohn wrote music to Shakespeare's play "A Midsummer's Night's Dream," but it is not called a *suite*.

Petrel.—Although the Passion Music by Sebastian Bach is the most widely known, it was far from being the first setting of the sacred subject. In the fourth century the Passion was presented in dramatic form with music; the work of Gregory Nazianzen who lived between 330 and 390. In 1586, at the instance of Pope Sixtus V, there was published at Rome the "Passion of Our Lord Jesus Christ" set to music. St. Matthew's version was made part of the Mass of Palm Sunday; St. Mark's on Tuesday of Holy Week; St. Luke's for that of Wednesday, and the version of St. John on Good Friday.

Musical antiquarians in London, notes the New York *Evening Post*, enjoyed a performance on June 15 of an opera by Purcell, which had not been heard for a couple of centuries. Apart from the music, there was a special reason for this neglect. The score, in short, was stolen, and although, in 1701, the treasurer of the Theater Royal in Covent Garden offered 20 guineas reward for the MS., the thief did not claim it. In those days the punishment for such book "collecting" was the gallows. The English critic, Mr. Shedlock, within recent years spent three of his holidays searching for the missing score in continental libraries, but finally found it at home, in the Royal Academy of Music, where it had been for more than sixty years. The libretto of the opera is an adaptation of Shakespeare's "Midsummer Night's Dream."

INTERPRETATION.

MARIE BENEDICT.

In these days of extreme technical development, when every piano student is spending unlimited time and strength in the necessary acquirement of pronounced skill in the mechanical side of piano playing, it may not be amiss to lay an especial emphasis on the certainly equal necessity of the musical, the interpretative side of the student's work. For it sometimes seems as if not students only, but concert pianists as well, were sacrificing the genuinely artistic to the exploitation of their own marvels of technical accomplishment; preferring to astound the curious by the wonders of their physical performance, rather than to send the art content of the composition to the psychic depths of the genuinely musical listener. Interpretation, says the wise man who made the dictionary, is the act of rendering intelligible to another; the act of translating from unknown into known signs. Any rendition of a musical work, which does not make intelligible to the natural lovers of music among its auditors (whether they have ever been students or not), something of the real meaning of the composer; which does not translate this meaning from the—it may be to the listeners—unknown signs of the printed page into the known and immediately recognizable expression of human feeling in all the wide range of life experience, whether it be passion, terror, tragic grief, tender reverie, joyous abandon, or the sparkling play of pure fancy, for music sounds all these moods in their every varying shade of feeling—any rendition of a composition which does not thus translate the music's message, falls below the rank of interpretation. Though every note be struck with perfect accuracy, though the greatest number of played notes per second be attained, it is pianistic athletics; but it is nothing higher. It is the setting without the gem—interesting it may be to the professional for the marvel of its workmanship—but without the treasure which it was designed to guard, and to bring within the ken of men, for their education and their delight. Only empty meaningless glitter, after all has been said that can be said of its technical miracle.

So many are the details that go the realization of a finished interpretation, that some of them are apt to be unconsciously overlooked by even the advanced student—in which case, disappointment to the listener is the result. For the listener, if he have real fondness for music, often feels that something is lacking, whether he can explain the reason for the feeling or not.

Never fail to assure yourself, by listening most critically to your own playing, that the melody is so perfectly individualized that it will at once catch and hold the attention of the most inexperienced auditor; no matter in which hand, or in what register it occurs; no matter what brilliance of crystaline embroidery, or what glow of harmonic color there may be above, below or around it, *the melody must be that which is of all else most prominent;* or the meaning of the whole will be lost.

But you say, "Why dwell at such length on this truth, which is in itself perfectly evident?"

Self evident indeed, it seems; but the playing of many a student, and of some recital pianists, has shown that it is by no means always acted upon, though it is at once apparent to the receptive mind. One reason for this is, that the player does not always realize that what may be clear enough to his own ear through familiarity with the score, will be entirely missed by him who hears the music for the first time, and with not the most experienced ear, unless it is made to stand in unmistakably clear relief against its background of harmony. And that this clear relief, this solo effect of the melody, adds infinite beauty to the whole—to the listener most practiced in art as well as to the novice.

Another cause is, as already suggested, that the student allows interest in the technical side of the work, to exclude requisite thought of and attention to its central life—its theme. He allows the brilliance and richness of the setting to so cover the gem, that the external glitter, instead of the warmth and glow of the jewel, holds most of his own attention; and consequently outsiders realize little or nothing of the beauty of what is beneath; the beauty which the setting was designed to enhance instead of to obscure.

Remember, that when the melody lies along the surface of a succession of chords, as in portions of the Liszt transcriptions of the "Erl King" and of "Hark, Hark, the Lark," as in portions of the Schubert Impromptu, Op. 142, and of other works whose name is legion, the taking of each full chord with a firm, elastic pressure touch is not sufficient for the production of the solo effect required by the theme. In each case, the melody note must be given with the greater pressure than that used on the subordinate tones of the chord, that will produce the simulation of a solo with rich harmonic accompaniment; rather than that of a succession of chords in which the theme is sometimes on a dynamic level with the under tones, sometimes submerged in their harmonic flow, so that the poor listener is left to take his chance of catching the melody, or of wondering what may be the meaning of all those notes—as fortune favors him.

Attention to rhythmic effects, for rhythm is the music's heartbeat; knowledge of the right use of rubato; when to accelerate; when to slacken the time so that the meaning will not be exaggerated, caricatured, but rather, will be marvelously intensified; are absolute indispensables to true interpretation.

Do not indulge in the fallacious idea that any undue and uncalled for gesture or movement, when at the piano, will ever add one whit to the effect of your work, to your reputation, in the estimate of those who know. That which Mr. W. J. Henderson, the well-known musical critic of the New York *Times*, aptly characterized during the past winter as, "that waving of the hands, which used to be considered the sure mark of the virtuoso," will impress the comparatively uninitiated listener sometimes at the cost of her attention to the music (I have this last from the very lips of such a listener); but it will never add one iota to the artistic effect, it will rather detract therefrom. The audience does not, or perhaps I should say ought not, to gather for the purpose of seeing from how great a distance above the keyboard the player can strike the right note; but to hear the music. Audiences have something yet to learn in the field of musical art. Concentration should always be the watchword of the pianist, and unnecessary movement of any sort at the piano is wasted energy.

There is one thing which, were a reckoning taken, I doubt not would be found responsible for more fiascos than any other in the whole range of pianistic experience; and that not only among young players, but sometimes also with those of long experience. That one thing is, through excessive nervousness, or from any other cause, the taking of a piece, or any particular passage in a piece, at such a rapid tempo in its initial measures that the desired effect, both technically and musically, is made impossible from the start. For a pace once taken in such cases, cannot be slackened witout marring the art work; these not being the cases where the meaning of the music demands the slackening of the time. When one is excessively nervous, a really rapid tempo, that at which the piece or passage has always been played, will seem slow—such tricks will the nerves play upon the mind—and thus the danger of rushing headlong to technical and musical disaster is greatly increased. A very successful concert pianist once told me that in the early days of his professional work, he often tested the time of his program numbers by the tick of his watch; and then, by placing the timepiece at his ear just before going on the stage, fixed the right tempo in his mind in spite of tricky nerves emphatic asseverations that that particular pace was too slow. As I once chanced to hear one of New York's first ranking teachers say to a pupil, "Take time enough to make it beautiful." Whether it be one passage, or an entire piece, remember that you have all the time there is; and that the certain road to failure is yielding to the almost irresistible tendency to hurry when approaching any special technical difficulty, any phrase or passage which has given you most trouble in your practice hours.

As intonation, inflection, emphasis are to the delivery of the actor's lines, as the wonders of light and shade, in black and white and in color, are to the work of the artist of the brush and crayon; so are the dynamic effects, in all the wide range from fortissimo to pianissimo, to the work of the pianist. And just as, without this intonation, inflection, emphasis, without the witchery of color and of light and shade, the lines of the actor and the work of the painter would be only wearisome monotony, giving no intelligent idea of the subjects they are supposed to interpret, so, without the delicate nuances of expression, those subtle gradations of tone which may be made so eloquent with the composer's meaning, those musical and oratorical accents, which have so marked a share in enabling the listener to understand and to appreciate the music, piano playing degenerates into mere noise; harmonious or inharmonious as the case may be, but with no musical nor artistic right to existence. The piano student cannot too carefully study these varying shades of expression; for marvels of interpretation are accomplished by the slightest variations of tone, as well as by the most pronounced crescendo or diminuendo. And, like everything else worth the having, the power to produce these exquisitely delicate tonal shadings does not come at one's call, but only after the student has shown by earnest study that his is genuine love of the work, does the muse thus endow him.

Attention to the rhythmic accent in successions of chords or of single notes in dual, or in triple rhythm, is in itself a little thing; but its presence or absence may greatly add to, or detract from the effect of the whole. In rapid successions of such notes or chords in the rhythm of two—definite accent of every other one—at once averts the danger of monotony and imparts a rhythmic movement which has its own share in interpreting the spirit of the composition. And when dual and triple rhythms succeed each other in alternate measures, as in the last page of the Schubert-Liszt "Erl King," definite accent of the pairs, as well as of the triplets, adds tremendously to the effectiveness of the work.

The pedal is another means of interpretation whose importance cannot be overestimated; for it may inexpressibly enhance the beauty of the composition in hand, or utterly ruin all musical effect, as it is used with appreciative intelligence or with thoughtless extravagance. To fancy the student of painting trailing his wet brush across the face of his sketch, thereby producing a hopeless conglomeration of color, is quite preposterous. To fancy that the piano pupil sometimes holds the pedal over radical chord changes, or over consecutive single notes of unrelated tone color, thereby producing blur and discord equally hopeless, should be equally preposterous; but do the facts prove that it is so? It is often necessary to depress and release the pedal with great rapidity, for we cannot forego the charm which its briefest touch has power to add, any more than we can endure the uproar caused by its undue use. In an article upon the piano, which appeared in *Music* a few years ago, Mr. J. S. Van Cleve said of the pedal, "It is like Prussic acid: A little imparts a most delicious flavor, but too much is a deadly poison."

But, before and above all that has been said, there must, of course, be that genuine love of the art which will not rest without searching study of the composer's innermost meaning in theme and movement, without itself feeling, as far as may be possible, the mood with which the writer has individualized the music. If this is lacking, volumes of rules and suggestions will produce only an automaton—never an interpreter. For as the body without the spirit is dead, so technic, without interpretation is dead also.

Will all the student readers of THE MUSICIAN see that this paraphrase of a familiar quotation is graven on the tablets of their memories, together with that before given, "Take time enough to make it beautiful."

Schumann, as is well known, was a great admirer of beautiful women, and before he met Clara Wieck, who became his wife, he was always falling in love with one or the other. One of his flames, Anna Robina Laidlaw (Mrs. Thompson), recently died in London, aged eighty-one. Her father was a wealthy Scotchman, a friend of Walter Scott. He lost his money and took his family to live in Germany. Here his daughter soon attracted attention by her musical talent. Paganini expressed great admiration of her art, and the King of Hanover, and subsequently the Emperor Wilhelm were among her patrons. She knew Grisi, Mario, Lablache, Rubini, Wagner, Ole Bull, Meyerbeer, and other famous musicians. Schumann used to take her to the opera and arrange excursions with her and her mother, who was her constant companion. When she left Leipzig, Schumann opened up a correspondence with her. In one of his letters he wrote: "The remembrance of your stay here will always be among my pleasant reminiscences. The sincerity of my sentiments is attested by the eight *Phantasiestucke*, which are about to appear and which bear your name on top. It is true I did not ask your permission to dedicate them to you, but to you they belong, and the whole romantic story of the Rosenthal is therein described in tones. Where shall I send you a copy?" Then he reproaches her for not having sent him her photograph, pays a compliment to her mother's beautiful eyes (both mother and daughter were of unusual beauty), and begs her to write soon. After Miss Laidlaw became Mrs. Thompson she lived in retirement at Bayswater, never played, and seldom spoke about modern music.

THE MUSICIAN.

A Monthly Publication.

EDITED BY
ARTHUR L. MANCHESTER, A. G. O.

PUBLISHED BY
HATCH MUSIC COMPANY.

SUBSCRIPTION PRICE.

SINGLE COPY . . . . . $ 15
PER YEAR 1 50

Free of Postage in the United States, Canada and Mexico.
Foreign Postage, per Year, 72 Cents.

Remittances should be made by Bank Draft or Check, Post Office Money Order, or Express Money Order. *Where none of these can be procured*, money can be sent in a Registered Letter.

New Subscriptions can commence at any time during the year.

Discontinuances.—The publishers should be notified when a subscriber wishes his paper stopped. In the absence of written notice to the contrary, subscriptions will be continued.

Communications are Solicited from all interested in the teaching and study of music, and in furthering the success of THE MUSICIAN. All articles or communications intended for publication should be clearly written on one side (only) of the sheet. Those which cannot be used will be returned.

All Letters should be addressed and **Remittances** made payable to

HATCH MUSIC COMPANY,
Publishers of THE MUSICIAN,
Eighth and Locust Streets, PHILADELPHIA, PA.

The Publishers of THE MUSICIAN do a General Music and Music Publishing Business. They can supply anything in Music.

PROPOSING AND DOING.

There is a saying which tells us that a place we all hope to avoid is paved with good intentions. It is not an elegant statement, but it strongly testifies to a truth. There is an element in human nature that causes one to derive relief from a decision to do better, and the intention often affords so pronounced a satisfaction that one proceeds no further and the realization does not take place. As we are formulating our plans for the coming season, we will do well to seriously consider this weakness of our natures. It is one thing to propose to do a thing, and quite something else to do it completely and well. There undoubtedly will be many propositions for the coming year's work. We will propose to carry out many plans, but will we do so, is the question.

●

Very likely our experience during the year past has taught us some valuable lessons, and we have seen the necessity for a revision of our methods. We therefore have determined to forsake the ruts in which we have been moving and propose to carry out certain improvements which we feel will make our teaching more effective and produce better results. This resolution is thoroughly commendable, but of itself will not be productive of the results we so much desire. A backward look will remind us that we have made similar resolutions in the past, and yet we are in our ruts, doing as we have for a long time.

●

The business man knows the value of theory, but he also knows that theory unsupported by practice is void of good results. So the teacher should remember that good intentions alone, like theories, are commendable but incomplete. Are you planning a series of pupils' recitals to be given on historical lines, or to exploit some particular phase of musical work? Do not propose only, but *do*. Give them, despite obstacles expected and unforeseen. Let the difficulties spur you to greater and more concentrated effort. Have you found your methods of teaching inadequate, and do you propose to improve them? Do not stop with this resolution, but *do*. Find out just where improvement is necessary and how it can best be made, then carry out your determination and make a better teacher of yourself. Have you discovered defects in yourself, lacks in your personality that militate against your success, and have you decided to overcome these faults? Then do so. Strengthen your purpose, cling to the desire and conquer yourself.

●

It would not be far wide of the truth to say that a very large proportion of failures is caused by the failure to do after it is proposed to carry out any plan of procedure. There are many who can and do plan wisely, whose plans apparently contain every essential of success, yet whose failure is complete and ignominious. If we would investigate we would find the plan had been both beginning and end. The proposing was all right, but the doing was lacking. Examine your own career, and see if some of your own failures are not due to this cause. The time is opportune for such an examination. It will bring you a greater meed of success if you will take care to do what you plan to do, and a thoughtful determination as you plan for the year will do much to set your face in the right way.

●

SELF-PLAYING INSTRUMENTS.

For sometime speculation has been rife concerning the effect upon music teachers of the advent of self-playing instruments. The piano-organ and its forerunner, the hand organ, are familiar to our readers as is also the dreadfully mechanical character of the music they produce. But of comparatively recent development is the self-playing instrument that plays Beethoven Sonatas, Liszt Rhapsodies, Schumann Etudes Symphoniques with faultless technique and dynamic finish. There have been those who were loath to accept these instruments as anything more than varying forms of the mechanical torturers first named. Yet even these have been compelled to acknowledge that there is merit in them.

●

In a recent editorial, Mr. W. S. B. Mathews, says:

"Curiously enough the music played by these instruments need not sound mechanical. The facilities for accenting, the application of pedal and the absolute control of tempo are now so perfect that an artistic rendering is possible—or at least something so near it as to quite remove these instruments from the reproach which formerly attached to them. . . . . I confess that I have been much surprised to find the welcome which virtuosi give these instruments. Everybody has seen the recommendation given by the Dresden pianist, Emil Sauer, and I have heard Godowsky tell how amazed he was at hearing his own "Badinage" played by a pianola more surely than even he could do it himself. The astonishment and admiration which these great artists give the pianola shows how terrible is the pressure upon them of never being quite able to attain to their own ideal of finger perfection. Many pianists do not know how far they fall short; but these artists do, and when they hear a thing done to perfection, they at once recognize the satisfaction they feel.

"It is not true, however, that any person can place a roll of perforated paper in one of these machines and immediately realize the ideal he has of a certain complicated or difficult piece. The self player is a player which you control yourself; the "self" you furnish, the instrument does the rest. Take one of these instruments in a far-away country home, where artists are never heard and where the prevailing instrumental selections are rag-time or commonplace salon banalities, and suppose the ambitious woman provided with a roll for a sonata or important concert solo. What happens? Inevitably that it goes through so fast that she fails utterly to get the effect the piece was meant to furnish. In order for her to be able to reproduce a master work by means of a roll, it is necessary for her to know the master work in all its ideas, *tempi*, *ritards*, *accellerandos*, the use of pedal, and other general points of interpretation. . . . .

"The truth is that the self-playing apparatus is not complete when the rolls are bought. Besides having the rolls, which are merely the instrument's technique for that particular piece, the player needs the music itself, the ordinary print, and this also should be marked for its tempo and general style. Then by looking through the notes and ascertaining the tempo by means of a metronome, to get the movement, one is in position to bring out in time all the fine points of the piece. Wanting assistance of this kind, the buyer of a self-player is in danger of giving up the search for the higher kinds of music and of confining her work to waltzes, dances and popular selections with which she is familiar. The self-player does not take the place of musical knowledge; it merely furnishes some better fingers than most people happen to have of their own."

The status of the so called mechanical instrument is well put by Mr. Mathews, one who has heard the grind of one of these self-players when manipulated by one who does not know the music they are trying to reproduce, will realize the truth of the last statement. And for this reason these instruments will never supplant the piano, nor will they lesson the opportunities of the teacher. *Per contra* they will stimulate just such study as Mr. Mathews hints at, and to their perfect technique will be added the modifying element of a complete musical knowledge, a union which will produce unusually happy results.

●

THE TEACHERS' FORUM.

The following letter is a response to the Teachers' Forum and is interesting in its showing of the good done by that department. If our readers would but realize it, that department opens before them an unexcelled opportunity to gain and give benefit of the most pronounced type. In the interchange of ideas and experiences, made possible through its columns, instruction stimulating and inspirational may be had. It can be made the meeting place where every teacher confers with his fellow, with the suggestions and guidance of the director to give point and zest. Topics innumerable are ready for discussion. We would urge that MUSICIAN readers make this department an aid to their work during the coming year. Plan to use it regularly and freely; make it a business to come in touch with fellow teachers. Do not treat it in a haphazard way, but systematically avail yourselves of the opportunities it offers.

The letter gives something to consider.

"I have just read your article in THE MUSICIAN 'About Fundamental Training.' It expresses much of what has been my experience, in twenty years of preparatory teaching, but still I find the study of new minds and peculiarities as fascinating as ever, and keep, as my motto, 'One soweth, another reapeth.' The hardest thing is to try to pull up the tares which, either by careless teaching or inattentive practicing, have well-nigh choked the good seed. At present I have three pupils who have each had from two to four teachers before coming to me, and they are trials to patience and temper, but improvement is beginning to show with them all. The problem of turning back to first beginning was a hard one to them, but both they and their parents appreciate that it was a necessary thing to do. 'The Teachers' Forum' has been both a help and an inspiration to me, and I wish to thank you for it.

"Cordially,
"—— ——."

●

EXPERT OPINIONS.

This department has been presenting the views of various experienced musicians on the subjects of concert programs and the union of art and business. Both subjects are fruitful in points for debate. The widely differing tastes and opinions, the exigencies of time and place will always enter into the making of a concert program. There are, too, questions arising from sources outside the musician's environment which will make themselves felt and press for an answer.

The musician must eat and be clothed and sheltered, and hence the union of business and art must be achieved. The laborer is worthy of his hire is the record of our standard of living. If this is so, there is a hire of which the musical artist is worthy. We have other articles to add to these, and we invite our readers to express their opinions on these two subjects for each other's benefit. The making of programs for miscellaneous concerts is especially important and should receive the fullest discussion. The education of musical taste is so closely connected with concert work that our readers should be more than usually interested in it. What have you to say?

LEGATISSIMO.

HERVE D. WILKINS.

America has been the birthplace of a good many new ideas regarding piano technic. The spirit of inventiveness which is supposed to pervade the New World, has also manifested itself in countless new ways of training the hands for piano playing. The numerous hand gymnasiums and exercises, and the various schemes for table and free gymnastics for hand training which are extant in America, attest the restless spirit of our people continually striving to find out a better way—better because economical of time and energy, surer and especially more effective from a musical standpoint.

Such ideas have also characterized European methods in past times. The *Clementi* school of piano teachers were quite insistent regarding the depression of the metacarpals and the curving of the fingers in piano playing. Ehrlich, and other German teachers, held strictly to pressing the elbows against the body during piano practice, and the Dactylion and similar devices for lifting and taxing the fingers, were first promulgated in Europe. A set of rings into which the fingers are placed in order to get the resistance of lifting springs, is a similar device to that which Schumann used so disastrously for his hand

Among the devices for cultivating the fingers for strength and independence and acquiring a smooth legato, the so-called overlapping touch was at one time advocated by a leading American teacher and his followers, but at present its use is disavowed and advised against. The use of this touch as formerly practiced, led to a sluggish action of the fingers and a consequent blurred effect of passages.

The problem for the piano teacher and theorist is to secure, if possible, the benefits of this mode of the legatissimo practice, in the strength, security and fullness of tone which such practice gives, and to avoid all bad results, such as sluggish fingers and blurred passages. The writer holds that the true way lies in the habitual employment of the legatissimo in such passages as permit of its use, as well as in such passages as require the legatissimo for their proper effect; at the same time carefully avoiding it where its effect would not be musically good. The most obvious use of the legatissimo is in all sorts of broken chords, such as this from Liszt's Liebestraum, No. 3:

Also the broken thirds in the same work:

The execution of this and similar passages with overlapping touch, with absolutely free wrist and fingers, greatly helps the musical effect, for it gives a prominence to the harmonious interval, the sixth in each group, and it also gives repose and sureness to the touch and imparts confidence to the student, for it gives control and command over the mechanism of hand and finger. It also imparts fullness to the effect by prolonging tones which are harmonious and which, consequently, reinforce each other.

The works of Chopin abound in melodious effects produced by the overlapping of tones selected out of the broken chords of the accompaniment. See the right hand part of the Nocturne in F sharp and the left hand part of the Nocturne in B, Op. 32.

There can be no doubt that Chopin himself used this device to enrich the effect at very many places in his works, besides those places in which the effect is indicated by the double-stemmed notes. In the works of Beethoven and Schumann, and other composers, there are also frequent instances where a melody may be thus developed out of the accompaniment, and in recent editions many of these places are notated as they are to be played in order to indicate the rendering, which have long been followed by good artists. For the painstaking and industrious artist in the course of an exhaustive study into the meaning of a work, will discover little turns of melody in places where only subordinate matter seems to exist, and will by skillful inflections and emphasis, and discriminations in touch, enrich the effect of the whole work by bringing out these details.

It is thus that the artist often makes a good deal of music out of simple and often hackneyed material. Rubinstein's playing of Mendelssohn's Wedding March, and of Beethoven's march from the "Ruins of Athens," was always anticipated with doubt and afterwards listened to with wonder and pleasure by the very critics and performers who had been sure that the possibilities of such pieces had been long ago exhausted.

The overlapping touch is also most advantageous for young players at the top of ascending arpeggios:

Should be played:

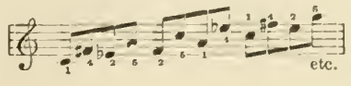
But with perfectly free wrist. One of the most common faults with pupils lies in the lack of finish and thoroughness in such passages and nothing sounds worse than a false note at the top of such ascending arpeggios. The final note of Chopin's Scherzo is not a case in

point, but it may be learned with sureness by dwelling upon the extreme notes with perfect flexibility and quiet. One thus acquires an absolute sense of the location of these notes at opposite extremes of the keyboard. Many artists, among them no less a name than Rubinstein, have been in the habit of touching this final note staccato and so missing it, as he did three out of four times.

Another advantage in the practice of legatissimo for broken chords and intervals is in the culture it affords to the muscles which move the fingers sideways, and which assist in locating the desired tones upon the keyboard, and so conduce to correct playing. The grasp of chords of three and four notes as they occur in such passages, shows an endless variety in the relative distances from each other which the fingers have to assume in executing them, and the contraction which occur between the last note of one octave position and the beginning of the next, and the extensions of the hand between times are most valuable for the hand. Such passages as these in double notes from Chopin's Berceuse, and from the Etude in double thirds in G sharp minor, can be mastered one-half sooner by lapping over the tones. Chopin Etude, Op. 25, No. 12:

Chopin Berceuse, Op. 57:

The diminished seventh chords occur in broken form in numerous instances, and are easiest fingered in groups for four fingers. This fingering is easier than the accepted fingering in couples, not:



But better:

See Raff, La Fileuse and Liszt Rhapsodie, XI.

These directions will be of most value to players who have a good tone-production, who do not bang or play with a clumsy touch, but who play with absolutely free motions with buoyant hands and arms, and with flexible clearness and mellow tone. To practice legatissimo with a hard wrist and with rigid fingers, using undue pressure, would make a bad touch worse. Those who employ the legatissimo legitimately in the sorts of passages where it is appropriate and effective, will gain in insight into such passages, and will acquire great facility in the comprehensive grasp of these and similar passages.

To avoid misunderstanding, it must be noted that Chopin sometimes employs the worst legatissimo in vocale passages, not in its accepted sense of overlapping touch, but as requiring great suavity of effect, avoiding all hammer-sound in the tones produced.

The practice of the overlapping touch is only one feature of hand-training, as it is one sort of musical effect. The practice of repetitions, pearly touch, and all kinds of staccato, as well as pure legato, must be continually followed by every thorough piano student. The hand must be schooled to every sort of touch and every grade of power, so that it can respond to every shade of musical thought, feeling and wish of its master mind.

WORTHY OF EMULATION.

When one stops to consider the comparatively few persons in our large population that really know and appreciate the best in music, it is not strange that the people of Galion, Ohio, are proud of having successfully produced "The Messiah," June 11 and 12. It was given with orchestra and a chorus of two hundred voices, and as the entire chorus, a fair share of the orchestra and the soprano soloist are Galion people, it is a matter of much credit to them.

The soloists were Mrs. Teo Long Todd, soprano, Galion; Mrs. William Miles, contralto, Ft. Wayne, Ind.; Mr. Ross H. Maynard, tenor, Boston; Mr. Gwilym Miles, baritone, New York.

While the whole production was worthy of note, special attention was drawn to the work of the chorus, which was unusual in its way. Of the two hundred persons who composed this chorus, seventy-five were adults and members of the Galion Choral Society. The remainder were the boys and girls of the Galion High School and the two together constitute the Galion Choral Union. Separate study was done by each—the High School doing theirs as regular school work—until about four months before the production, when the two societies began practicing together.

The credit for the successful production of so great a work is due to Prof. William Hood Critzer, Director of Music in the Galion Public Schools. Prof. Critzer is a man who combines with ability as a conductor and the power to obtain results, the happy faculty of inspiring his pupils with a love for the best in music and an enthusiasm for the work in hand.

As the boys and girls came into the High School and were able to sing separate choruses from the great oratorio the question, "Why could they not sing an entire oratorio?" naturally presented itself. The experiment was made one year ago when the Choral Union sang "The Creation" with marked success, this being, no doubt, the first time that an oratorio was produced by a high school. This production gave quite a little reputation both to Prof. Critzer and to Galion's chorus, but many musicians, who were not present to hear the work, were a little dubious as to the artistic finish of an oratorio sung by so youthful a chorus, for the average age of the entire body is not over twenty years. Their doubts were dispelled however by the work done in "The Messiah." Critics expressed themselves as astonished at the high grade of work done and special praise was given for the excellent rendering of the two choruses, "And He shall purify the sons of Levi" and "For unto us a child is born." In attack, tempo, accuracy and finish there was nothing to be desired. Fullness of tone was given by the seventy-five adult voices and musicians commented upon the chorus work as "clean and well-balanced."

Such work is invaluable in its influence upon a community. The effect of youths growing up to know and appreciate the works of the masters and thus elevating the taste of an entire community cannot be estimated. Each year brings a new class into the High School and each year a class is finished, most of whom join the Choral Society. Thus it can readily be seen that in a population of eight thousand the time may come when a fair share of the people will not only enjoy and appreciate the great oratorios but will know them also.

THE NEW EDUCATION.

FOREWORD.

The *New Education* offers its readers, for 1900–1901, the best plan for a year's study that it has yet presented. It will be the best in two particulars: In choice of subject matter and in manner of presentation. The hearty reception which this novel educational feature has met with makes it possible for THE MUSICIAN to continue to develop the idea of home music study and to offer the best advantages that are to be attained in this manner.

The series of subjects for the coming year follows. Each subject is in the hands of a specialist and will be treated practically and as fully as possible in twelve lessons. In order to meet the immediate demands of students who seek information on special points in the work, the editors will be glad to furnish

Suggestions for the further study of any subject.
A bibliography of any subject.
Information on any question in the lessons.
The consideration, and, if necessary, the presentation, or general discussion of any point that comes up in actual teaching.

The subjects for the coming year are as follows:

I. Advanced History of Music; twelve lessons, with suggested reading.
II. Psychology and Pedagogy of Music; six lessons in each subject; suggested reading.
III. Advanced Music Form; twelve lessons developing those already given in this department.
IV. Harmony and Melody; twelve lessons; six in each topic.
V. The Literature of Aesthetics and Criticism in Music, twelve lessons.
VI. The History and Development of the Piano, twelve lessons with illustrations.

The following conditions *must be observed:*

1. Address all communications for the *New Education* department, thus: THE MUSICIAN, New Education Department, 8th and Locust Streets, Philadelphia, Pa.
2. *Do* NOT *roll your manuscript.*
3. The answers for each month must be sent as soon after the issue of the journal containing the subject to which they relate as possible, and before the next succeeding issue. No papers are to be held until end of course. New members can join at any time by sending names and answering questions contained in current issue.
4. The editors are obliged to say that no papers will be read or rated that fail to comply with conditions 3, 4, 5 and 6
5. No two subjects should be written on one sheet. All sheets pertaining to one subject—for example, History—should be independently fastened.

Ratings will be largely influenced by the following points:

Accuracy.
Clear, concise, yet smooth diction.
Grasp of the subject.
Originality of thought and statement.

The questions following each lesson have two purposes: First, to connect the reader's mind directly with the text—the most fundamental, that is, the lowest duty a question can serve, but necessary. Second, to suggest a thought beyond the mere expression of the words in the text; the highest purpose a question can serve. The first is by far the least useful if he has a memory; the second the most useful if he has a reasoning faculty.

The editors will welcome letters from teachers which contain:

a. Suggestions as to what will make this department more valuable, the suggestion being dictated by the teacher's individual experience.
b. Statements regarding the application of this work with pupils as well as in one's own effort to secure a broader education.
c. If there is any line of thought of practical value to you, and likely to be equally practical to others, let us know it.
d. All such suggestions must be sent to the office of THE MUSICIAN, addressed according to direction given in regulations.

[NOTE.—*New Education* students are specially requested to avoid enclosing *anything* relating to their business with the Hatch Music Company with their *New Education* papers. The failure to comply with this rule causes great trouble. Kindly keep this matter in mind. We wish to call the attention of our students to the necessity of *fully prepaying postage on their papers.* We have been compelled to pay additional postage on a large number of those already received. This should not be, hence we request our students to take care that sufficient amount of stamps be affixed before mailing.]

X—INFLUENCE OF ROMANTICISM.

PERCY GOETSCHIUS, MUS. DOC.

Probably the most conspicuous and far-reaching consequence of the creation of the dramatic musical styles was, as intimated in the preceding chapter, the rapid development of *instrumental* music. The dramatic forms of oratorio and opera (particularly the latter), provided precisely the conditions most necessary and favorable to the perfection of the instrumental body, and it was not long before this had so far outgrown its original function (that of a subordinate accompaniment) as to discover a language of its own, and release itself from all need of vocal or poetic support.

The emancipation of the purely instrumental from the vocal style of writing was consummated about the end of the seventeenth century; the works of Joh. Seb. Bach (born 1685), equally eminent as composer for voices and for instruments, mark the momentous turning point in the long sovereignty of vocal music. The claims of instrumental music, as a new and distinct phase of the art were then well established, and during the following century it not only completely superseded the vocal style, but compelled recognition as the only true and genuine sphere of musical conception and expression. For the more music rebelled against dependence upon words, and the farther it withdrew from any external poetic or dramatic associations, the more was it thrown upon resources within itself, and forced to discover and depend upon means of expression peculiar to itself, specifically and absolutely *musical* in their nature.

These intrinsic musical means were so novel, so unthought of, that the art could not be all at once successful in their application and appropriation; the early era of instrumental writing, culminating in Bach, was but little more than artistically legitimate music, characterized by technical accuracy, a pleasant jingle and considerable rhythmic animation—traits resulting naturally from almost exclusive attention to the *element of tone*, aside from either the ability or the inclination to attach any other, deeper, meaning to it. Characteristic specimens of this stage of "absolute" music may be found in the clavichord works of Scarlatti, Rameau and others, a somewhat dry and superficial style, surviving in the so-called virtuoso music of comparatively recent times (Hummel, Clementi, Cramer, Herz, Thalberg, etc.). The succeeding generation obtained glimpses of the *soul* lying dormant within this correctly outlined and beautifully formed body—succeeded in wresting from musical technique some expression of poetic and dramatic emotion—and, by thus exalting its aims, multiplying its resources, increasing its power and determining its specific mission, brought the music-art nearer to the fulfilment of its ideal destiny as vehicle of emotional expression and excitation, far beyond the power of human speech. This service was rendered to the art by Ph. Emanuel Bach, Haydn, Mozart and the youthful Beethoven in the course of the eighteenth century, the classic era of music history. It paved the way for the last and highest achievement of music, and even entered partly upon its realization.

The so-called Romantic school, which was henceforth to mould musical forms and vitalize musical expression, began to flourish near the end of the eighteenth century. Its ruling purposes—to emphasize the imaginative, wonderful and mysterious, as the true essence of art and poetry—were identified with the spirit of romance that was so universal and powerful in the middle ages, and that had never died out or been without a certain constant subtle influence upon all musical development ever since. The infusion of this spirit into music was first effected, in a notable manner, through the romantic operas of Carl Maria von Weber, Marschner and others, which are distinguished for their originality, great fertility of imagination, brightness of melody, and no small admixture of the fanciful, supernatural and mysterious.

In the instrumental domain of composition, the romantic spirit manifested its influence in an intensification of the emotional elements, and a more pronounced *subjectiveness*. Every romantic composer sought to impress the stamp of his own personal emotional life, his individual imagination, upon his music. The pioneers of this new phase of musical expression were Berlioz, Chopin, Mendelssohn, Schumann (all born during the first decade of the century just ended), and, in a measure, Schubert and the mature Beethoven. The music of each one of these masters is as different from that of each of the others, and from all previous types, and at the same time as distinctly individual in itself, as the pursuit of the purpose above defined—that of extreme subjective revelation—could severally make them; as different, in a word, as were the persons themselves. And this trait is, therefore, to be regarded as the most salient and distinctive of the new Romantic school. Nowhere among the earlier generations of composers can the same distinctness of style, the same *individuality* of music be found; even that of the great Bach resembles externally the prevalent style of all his contemporaries. It is not easy for the average music lover to distinguish the music of Clementi from that of Hummel, or that of Haydn from Mozart and the youthful Beethoven; but there is a personality to the music of Berlioz, Chopin, Mendelssohn, Schumann, Liszt, Wagner, Grieg, Tschaikowsky—each the outgrowth of subjective expression—that is readily apparent even to the superficial observer.

QUESTIONS.

1. What phase of practical music was most affected by the dramatic forms?
2. When was the separation of vocal and instrumental music consummated?
3. What followed?
4. By what was the early era of instrumental composition characterized?
5. Who are its representatives?
6. What did the succeeding generation achieve, and through whom?
7. What were the ruling purposes of the Romantic school?
8. What works exhibit the infusion of this spirit into music, and with what effect?
9. How was it manifested in later instrumental works?
10. What is the most salient trait of Romantic music?

FORM—TENTH LESSON.

Constructive Form.

THOMAS TAPPER.

Bach's habit of copying music (by moonlight, if he could not get it otherwise) was more to him than a mere convenience of attaining a copy. The hand, as it has been remarked, is a great remembrancer; and Bach must have learned very early that the mere act of attentive work with a pen brought its own reward. We are less given to doing such actions these days. Music by the masters is to be had for a few cents, and with a few cents in hand we go and purchase it. If we had to make a copy or go without it, would be the better for us in that it would force upon the attention many a matter of music construction and music expression which has to be drummed into us by other means or forever lost.

Every student of the New Education Department should be willing to procure knowledge in the best manner. And no manner ever can exceed in value that which brings one into the closest intimacy with a work. Copy a sonata a dozen times, or even copy a dozen sonatas once and observe the effect it has upon the musical memory.

Let us suppose then that all of us believe in hand-work. We have been composing Phrases and Periods. Let us now turn to greater composers and search any one or all of the following or similar works, to find examples of Phrases and Periods of various kinds. Take, for instance, the sonatas of Haydn (ten), of Mozart, the first volume of Beethoven's, the Op. 68 of Robert Schumann, and the Songs Without Words of Mendelssohn.

Let us not be content this time merely with a nodding acquaintance of Phrases and Periods as we come upon them, but let us copy them with patient care and possess by our own finding a collection of these elementary forms, better than which no other can be.

It may be a weariness to the reader's spirit to consider that this plodding industry should accompany the subject to the end. But that is the way really to master it. Or, more truthfully stated, that is one item in the mastery.

Now with a commonplace music-book full of the best music quotations one should study them from every point of view: (1) As examples of Form; (2)

As music with a meaning; (3) As an individual expression; (4) As a small portion of a larger work. These and many other suggestions will announce themselves to the student who truly desirous to make the most of this study and seeks to discover ways to do so.

Returning now to the Constructive feature of this work, we have thus far written (in major and in minor) in step and skip forms of melody. Still, keeping to the Phrase and Periods (but practicing its Long and Short, Regular and Irregular varieties), he should next introduce the sharp-inflex. By sharp-inflex is meant the entrance of a so-called sharp tone between the scale tone above it and its repetition; thus, F sharp between G and G; the group of three tones being G, F sharp, G.

Examining the degrees of the scale in order we find that such sharp-inflex groups occur (in the C major and similarly for all others), thus: D, C sharp, D; E, D sharp, E; G, F sharp, G; A, G sharp, A; B, A sharp, B. These foreign tones do not change the key, *i. e.*, bring about a modulation, but they serve to render emphatic the scale tone from which they are approached and to which they return.

Having written examples containing this device until its effect is thoroughly familiar, the pupil should again take up his classics and search them for examples—these to be written out and studied until they are mastered.

It will be noticed that these sharp-inflections are not equally non-committal in what they suggest as to modulation. G, F sharp, G, for example, can easily be made to bring in the key of the Dominant, while A, G sharp, A fixes with equal force the relative minor key. Of the five inflections possible in major these two are strong.

The pupil may next compose melodies which, at a Phrase or Period end, terminate with a modulatory sharp-inflex. To be definite, the following examples may be written: Periods of eight measures, the modulation to be complete at the end of the first Phrase; the return of the principal key complete at the end of the second Phrase.

1. From C to its Dominant and Return.
2. From C to its Relative Minor and Return.

Repeat in every major key, changing the meter frequently so as to establish new idioms.

The sharp-inflex suggests somewhat weakly the minor keys of the second and third degrees, but still with a little skill the pupil will be able to pass, say from C major to E minor and from C major to D minor, without using the tone F sharp in the former case or B flat in the latter.

The October Lesson will review the general principles of the subject as taken up in the present year's lesssons and give a bibliography.

THE RHYTHMIC UNITS AND THEIR SUBDIVISIONS.

DR. H. A. CLARKE.

Rhythm bears the same relation to time that symmetry bears to space. It is the recurrence of an accent—real or imaginary, at equal distances in time—just as symmetry is the recurrence of a given figure at equal distances in space, but the resemblance ceases here, for the reason that rhythm moves like a straight line; but symmetrical arrangements may be made to conform to any curved lines as well as to straight lines. Another difference is, that symmetrical units are infinite in number, whereas rhythmic units are but two in number, viz, \1, 2 and \1, 2, 3. Yet despite this apparent poverty of resource, infinite rhythmic variety may be secured in melody by subdividing these units.

We stated above that this rhythmic accent was "real or imaginary." It is, in truth, far more imaginary than real. A melody played or sung with a real stress on the first member of the rhythmic unit would, in all probability, be deprived entirely of its *musical* quality. The best illustration of the unreality of this accent, is to be found in the fact that we never fail to recognize the rhythm of a piece of organ music by mistaking 4-4 for 3-4 time, yet the organ is incapable of accent. Hence the rhythmic quality must depend on some other factor. That it is purely mental is proved by the fact just quoted about organ music.

To illustrate further, play the following phrase in 3-4 time, the rhythm of which is divided in such a way as to give special prominence to the accented member of the unit:

Then play it as follows in 2-4 time:

It is at once evident that the rhythmic division is not the cause; in fact, the regularity of No. 1 makes it rather commonplace, whereas the irregularity of No. 2 sounds much better. Observe also that No. 1 sounds complete—being a four bar phrase—but No. 2 sounds incomplete, as it has only six bars, and one of laws of melody that it is almost impossible to get away from is, that all melodies must consist of multiples of 4 and 8 bars.

If these two forms of this phrase were played on the organ—by some mysterious means—the organ player would convey the rhythmic unit to his hearers. Who can tell how? Subtle and intangible as this rhythmic pulse is, it is, nevertheless, the very basis of music. In addition to the rhythmic variety that may be obtained by the division of the units, a still wider sweep may be given to the rhythmic p lses by compounding the units, thus: two units of \1, 2, give 4-4 time, in which there is a strong followed by a weak accent, thus: \\1, 2, \3, 4. Also in slow 3-4 time, we may have three units of \1, 2, thus: \\\1, 2, \\3, 4, \5, 6.

It may be still further varied by making the accent on the third member stronger than that on the second, thus: \\\1, 2, \3, 4, \\5, 6, which gives the rhythm of the polonaise. But all slow 3-4 is not compounded from the \1, 2 unit, but may be itself a unit of \1, 2, 3 as in a slow waltz with accent on first beat, or in a Saraband with accent on the second beat, thus: 1, \2, 3.

In the more commonly used compounds of the \1, 2, 3 unit, viz: *6-8*, *9-8* and *12-8*, we have in 6-8, two units of \1, 2, 3 with the accent of \1, 2; in 9 8, three units with the accent of \1, 2, 3; in 12-8, four units with the accents of the first compound of \1, 2, viz.: \\1, 2, \3, 4. It will be easily seen that the varities that may be produced by compounding and dividing, even apart from melody, are practically infinite.

But rhythm has a still wider sweep than the measure. Its first extension is to the "motive" of two measures; this doubled produces the "phrase" of four measures; this doubled, the section of eight measures; this doubled, the typical "lyric" melody of sixteen measures. It is a singular fact that the rhythmic unit of \1, 2, 3 will not produce satisfactory melody when applied to the "motive." The very rarity of it, and the fact that three bar motives have been successfuly used by the greatest composers only, is proof of the difficulty that attends their use. In the majority of cases it will be found that if they sound well, they may be better expressed by being written in a compound time. The following melody, for example, sounds very well; but its effect to the hearer is four measures in 3-4 time compounded from three units of \1, 2, not twelve measures with a single unit of \1, 2 in each measure:

The province of rhythm may be still farther extended. In the sonata or symphony, the first and second theme, taken together make the unit \1, 2. Each is presented twice. The principal (or accented member) never changes its key. The secondary, after making its appearance in another key, reappears in the key of the principal, thus fulfilling the rhythmic requirement \1, 2, \1, 2. It is this thematic rhythm that gives its dignity to the sonata form, a dignity that no other instrumental form possesses. Thus we see that, beginning with the simple elements \1, 2, or \1, 2, 3, the rhythmic idea expands in everwidening circles until it includes the largest "form" of pure music that has as yet been devised.

Music remains the universal language of nature; it speaks to us in wonderful and mysterious tones; in vain do we try to retain its effect by signs—for any artificial connecting of the hieroglyphs results, after all, in indicating the idea of that which we have heard. —*Hoffman.*

THE DEVELOPMENT OF THE PIANO.

FRANCIS L. YORK.

Almost every musically-inclined person has noticed, in listening to the singing of unaccompanied voices or to string quartets, that the harmony produced is often much more satisfactory than that of the piano, the organ or voices accompanied by instruments. There is a subtle something present in such music that is quite different from the effects produced by keyed instruments. This is perhaps most noticeable in the case of male quartets that practice often, sing together much and sing but few pieces. I remember a quartet of this kind that I frequently heard sing in my college days. There was no voice of the four that was of more than ordinarily good quality, and yet the singing of this quartet was charming. In the common way of expressing it, their voices "harmonized" so perfectly. Similarly the playing of a really good string quartet has something satisfying, something appealing in it that we miss in most other music. In what does this quality consist? It is, undoubtedly, in the fact that the voices or the stringed instruments are capable of singing in "just" or "perfect" intonation, and when the singers or players have worked together sufficiently they unconsciously adjust the pitch of their voices or instruments, so as to produce the most perfect harmony, not "tempered," but "pure." In a former article we have studied the matter of temperament by means of which it is possible on a keyed instrument to use the various key relationships that are so necessary a part of modern music. But we learned that this tempering is done at the expense of pure harmony, the fifths being too small and the thirds and sixths either too large or too small. A perfect instrument would be one on which the player could, at will, produce a tone of the exact pitch required to harmonize perfectly with the other tones sounding with it. But no keyed instrument, so far invented, can do this. That this is a serious drawback in many instances no one can doubt. As Helmholtz says: there can be no question that the system of equal temperament, on account of its simplicity, possesses extraordinary advantages for instrumental music; that any other system would require a far more complicated mechanism of the instruments and render them far more difficult to manage, and in consequence that the high development of instrumental music was possible only under the domination of the tempered system of tuning. But one must not think that the difference between the tempered and the natural systems is a mathematical subtility of no practical value. Actual observation at a suitably tuned instrument immediately shows that this difference is striking enough to be noticed by persons of very ordinary musical talent. Moreover, we see directly that the same thing was felt by earlier musicians who were still accustomed to the pure intervals of vocal music then very carefully studied, when we cast a glance over musical treatises of the second half of the seventeenth and the first half of the eighteenth centuries, at which time the introduction of various systems of temperament was the subject of warm controversy, when methods on methods were invented and rejected, aiming at conquering the difficulty, and most ingenious styles of instruments were contrived for the practical realization of the enharmonic differences between the degrees.

We have already mentioned some of the ways in which the older makers of keyed instruments tried to solve this problem—all of them very imperfect and some of them very clumsy. The proposition before us is this: Perfect intonation is, at least in many cases, desirable, but to attain it in all cases, even with perfect instruments, is impossible. This comes from the nature of the scale itself and the relationships that exist between the keys. The problem then resolves itself into this, How far is it practicable to attempt perfect intonation? We must remember that perfect intonation is entirely possible, even on keyed instruments, if we confine ourselves within very narrow limits; in fact, on our equally tempered instruments we have perfect intonation of the octave, but this is the only interval that is perfect. In the system of Pythagoras, the great musical philosopher of the ancient Greeks, the fourths, fifths and octaves were tuned perfect, but the major and minor thirds with their inversions the minor and major sixths were very much out of the true proportion. It is interesting to note that even in the time of Pythagoras this same problem was being discussed, and his opponent Aristoxenos some two hundred years later, advocated the exact system that we now use—that of the equally tempered scale.

Until comparatively recent times it was not uncommon to find the keyboard of the organ arranged with an extra key between A and B and between G and F. This was a sort of compromise between the equal division of the scale into twelve parts and the older notion of trying to represent accurately all the tones required. One instrument, made in 1548, had the lower white keys arranged as in our present pianos, but between B and C and between E and F there was a white upper key, and between the other white keys there were two short upper keys, one white and one black, so that there were nineteen keys to the octave. Of course, even with all these keys, actually perfect intonation in all cases was not possible. One of the most perfect of all these attempts at just intonation and perhaps one of the latest, was an instrument called the "Proteus," made somewhere about 1650, in Florence. It had five keyboards, arranged stepwise like the manuals of an organ, and a large number of draw stops. It is said that on this instrument one could play in any key without being disturbed by improper dissonances. In 1695 instruments were made containing extra wires tuned to pitches between D♯ and E and between G♯ and A. There were no keys for these extra tones, but they were playable by shifting the action to one side or the other. The writers of the time said that the builders had "now attained to the highest pitch of perfection" in these instruments.

In recent years there has been a revival of the old controversy, many arguments *pro* and *con* have been published, and many attempts made to produce instruments with just intonation. In 1850 Dr. Poole invented what he called an "Enharmonic Organ." He attained more nearly to perfect intonation by using some eleven modulation pedals. These he afterwards abandoned and used a very complicated keyboard. Since his time Mr. Jean Paul White has made many investigations and experiments, with a view to constructing an enharmonic organ—or rather harmonium—which, by means of additional keys and by certain slight changes in the relation of the tones to each other, should approach more nearly to perfect intonation. Whether his attempts have been successful is very doubtful if we regard them from a practical standpoint. His keyboard is so very complicated, and an instrument built on this plan is so cumbrous, that it can never come into general use. In fact, such an instrument could hardly be built with any other tone producing medium than the free reeds of the harmonium, for with the piano and especially with the pipe organ, the necessary bulk, the great expense and the difficulty of keeping in tune would preclude the possibility of these instruments being built on such a plan.

We may sum up the subject in the words of Weitzmann, who says: While it is impossible for the unaccompanied singer to maintain perfect purity in the intervals without at the same time leaving the pitch, the piano, on the other hand, can never attain perfect purity of tuning by a multitude of its tones and keys. Equal temperament, however, avoids both these dangerous reefs and deviates so imperceptibly from absolute purity that our most eminent composers have always given preference to the well-tempered pianoforte and have dedicated to it their most pregnant works.

QUESTIONS.

1. What difference is noticeable between vocal or string quartet music and music on a keyed instrument?
2. To what is this due?
3. Can any keyed instrument give just intonation in all cases?
4. What were the systems of tuning advocated by Pythagoras and Aristoxenos?
5. Describe some of the attempts at just intonation in the sixteenth and seventeenth centuries.
6. What attempts at just intonation have recently been made?
7. Is perfect intonation always desirable when possible?

Like warp and woof all destinies
Are woven fast,
Linked in sympathy like the keys
Of an organ vast.

Pluck but one thread, and the web ye mar;
Break but one
Of a thousand keys, and the jarring jar
Through all will run. —*Whittier: My Soul and I.*

Sculpture, painting and literature sometimes hold us in their thrall, and indeed the latter is often the record of the sister arts; still, they cannot dominate our every fibre as does music.

A GUIDE TO THE STUDY OF MUSICAL LITERATURE.

ARTHUR L. MANCHESTER.

Many readers of THE MUSICIAN, unfortunately, are so situated that opportunities to hear great artists are rare, and the hearing of a large orchestra is rarer still. The education that comes from a frequent, intelligent listening to a combination of instruments, with their varied tone color and melodic and harmonic possibilities is denied them. Consequently there is a class of composition with which they have little chance to become familiar. The sonata is within their reach, but that acme of the sonata form, the symphony, is a sealed book. This is a pity and it is well to obviate the lack as much as possible. Four-hand arrangements of symphonies for piano can be had, and to play them thus is better than not to study them at at all. It is much harder to trace the interweaving of themes and the beautiful workmanship of development when so played than when the instruments of the orchestra give voice to the work. Yet such study should be given, and there are helps for the student.

The master symphonist was Beethoven. His nine contributions to this form of the tone literature have always remained the models for later composers. Four-hand arrangements of his symphonies are obtainable, and their study at the piano may be supplemented by the reading of a book, which should be in the library of every music lover.

"Beethoven and His Nine Symphonies," by Sir Geo. Grove, has two particular recommendations. First, the subject is of practical and living interest. Second, its author has established a reputation which makes his writing authoritative and thoroughly reliable. Though an amateur, he was a trained thinker and his investigations were well directed and, therefore, productive of good. He was an enthusiast, but not prone to exaggeration. He saw clearly and with true perspective. Consequently his book is a safe guide.

The nine symphonies are fully analyzed, the tempi of the various movements given and the instrumentation explained. In these days of annotated programs we are used to analyses, both good and bad, and much passes current for reliable information that does not deserve the credit it receives. These analyses of Grove's convey information and stimulate the imagination without unduly exciting it. To the matter pertaining directly to the symphonies is added other matter relating to the composer himself. There were unscrupulous publishers in those days, who strove to reap benefit by unfair means, and Beethoven suffered from their predatory instincts.

Shortly after the appearance of the first symphony an arrangement of it was published without any indication of its being an arrangement. Beethoven protested in a "Notice," which was inserted in a paper, in 1802. He says:

"I think it is due the public and myself to state that the two Quintets in C and E flat—of which one, extracted from a Symphony of mine, is published by Herr Mollo, of Vienna, and the other, extracted from my Septet (Op. 20), is published by Herr Hoffmeister, of Leipzig—are not original quintets, but only adaptations of the publishers' doing.

"Arrangement is a thing against which now-a-days (in times so fruitful of arrangements) a composer has to strive in vain. But one has at least the right to demand that publishers should state the fact on the title page, so that the composer's honor may not be endangered or the public deceived. This, therefore, it is hoped may be guarded against for the future."

This was signed by Beethoven. This and other items of interest and importance are incorporated in this study of the symphonies. If the student will take this work to the piano and combine its study with that of the symphony he will reap great benefit. The language is clear and temperate, the view points sound and musicianly.

Musicians, while they are supposed to be creatures of emotions and are now being accorded a standing as intelligent beings, do not, as a rule, stand high when psychological questions are under discussion. They are accused of using practically no psychological basis for their teaching and to know little and, possibly, care less about psychology as a branch of study. If this be so, and it is to be feared that there is too much truth in the assertion, it is high time attention was being turned to this phase of the teacher's work.

The study of psychology can be made as comprehensive as the student may wish. To the average teacher's time forbids a too deep delving into the subject, and its application to the needs of the music teacher, in case it is studied as a distinct subject, requires time and application. There is a work, published recently (in 1899), which makes this application for the busy teacher. Its title is "Relation of Psychology to Music," and it is the outcome of a series of lectures delivered by a professor of English Literature and Philosophy in Augustana College and Conservatory of Music. E. F. Bartholomew, D. D., the author, has done good service in placing before musicians this book which, while elementary in character, is well adapted to present a somewhat abstruse subject to unacquainted minds in a simple and clear style. The book is furnished with questions, by means of which the reader can fasten the essential principles in his mind.

A careful study of this volume will prepare the student for further and more advanced work in this exceedingly important field and, in addition, will have direct influence on his teaching ability, because it will provide him with a sound basis for his pedagogic deductions.

THE STUDY OF A SONATA.

Beethoven's Op. 2, No. 3, in C.

DR. HENRY G. HANCHETT.

SEVENTH ARTICLE—DEVELOPMENT.

The measures of each distinct movement (counting the trio as one), are separately numbered. Place a number before each bar, single or double, in the order as printed and without regard to the completeness of the measures.

The basis of a musical composition having real artistic worth, is a set of motives or themes which occur to the composer as inspirations. The composer is unable to tell the source of these inspirations, but the greatest masters of the art have recognized them as gifts from the "Giver of every good and perfect gift." Such inspirations come more naturally to those who live in music and are saturated with the literature of the art, but they are rarely the product of study or labor—they come, at least in germ—from outside. But a musical work is not a mere jotting down of such inspirations hap-hazard. Were it so, no more credit could be given to a composer than to a song bird who gives out what nature put in, without ability either to modify or restrain. The composer's task is to produce a masterpiece from the themes with which he is inspired; first selecting such themes as are appropriate to the style of composition intended, pruning, shaping, harmonizing, instrumenting and arranging these germinal elements, and then developing them by the various devices of the musician's art into the completed work.

Developing in musical composition signifies doing anything at all with an idea. The idea may be transposed, imitated, contracted, expanded, inverted, varied, and it is even possible to think of the placing of another idea in contrast with it as a method of developing it. There are many other ways of accomplishing the object. The skill of the composer and the value of his work are determined chiefly by his method of development, at least in the case of purely instrumental works. Let us consider how Beethoven has treated his ideas in the sonata before us and trace the germinal fragments through these devices by which he has made them grow into this completed whole.

The sonata opens with an idea that is chiefly rhythmical in its interest and that occupies 6 beats. This is at once (3-4) developed by free melodic imitation in connection with strict rhythmic imitation and modified harmonization. Then occurs a condensation (5-7 second beat) of the enlarged idea, effected by causing the second recurrence to start with the last note of the first recurrence, as was pointed out in the article in this series on "Rhythm." The idea is here further developed by greater rhythmical activity in the accompanying voices. In the *seventh* and *eighth* measures we have a development of the last two notes of the original design, and in the *eighth* a contrast by the introduction of two triplets. 9 and 10 are developed from 5 and 6 by inversion, and the complete cadence of 7 and 8 by development becomes that of 11 and 12. Then the idea of the changed position of the same chord as seen in 2 and 4 with the rhythm of the slow trills in 1 and 3, affords the suggestion for 13 and 14. 15 and 16 show the rhythm of the two preceding measures applied to the melodic idea of the triplets in 8. 17-20 show free imitation of 13-16. 21 has the inverted turn in 3 developed in the left hand, while the

slow trill of 1, with its descending conclusion, is developed into the quick trill with ascending conclusion of the right hand part. The triplet scale in 8 grows through that in 22 to the forms in 24 and 25. In 27 we come to new material, but yet the turn links the new to the old, as seen in the inverted turn of 3. Measures 27-32 are developed by transposition (and by special imitation in 35) into 33-38. 39 gives us the scale of 30 in faster notes and reharmonized in A minor, and 39 is readily traced in 41, 43 and 44. 47 gives us another new idea out of which is made the whole passage up to 61, yet there are suggestions of earlier ideas, especially of 29 and 30 in 52 and 53. 61 and following are developed from 13 *et. seg.*, and 69-73 allude to 12 in faster rhythm. In 77 we find a sort of retrogressive rhythmical imitation of the first design, and 85 elaborates and modifies 15.

All these references and comparisons show how the principal themes of the first part of the movement grow out of germs and suggestions, and how one thing that is a contrast, or accompaniment in one place becomes more important relatively in a later place. We come now to the second part of the movement, beginning with the double bar, and from that point we expect in sonatas the display in new light of the material of the first part. Accordingly we find in 91 the idea from 77 (I speak of the measure in some part of which an idea begins), developed by transposition. 98 is fundamentally in the right hand, a broken chord and as such derived from 13 through 61, but with a decided rhythmical change in the left hand giving strength and dignity, and in contrary motion as compared with the earlier passage. At 110 is a development by change of key, and at 114 there is a treatment of a part of the original design which is the reverse of that shown first in 82. At 114 also in the left hand, we see the octave skip which was at first (in 2) a repeated octave, then (in 8) a simple octave skip, then in 73 after various skips in quicker motion, something nearer to the form in 114, and that form by contrary motion and a development of the staccato second beat, becomes 116 with its suggestion of canon—a suggestion also hinted at from 130. At 140 we come to a reproduction of the opening thought, and at 162 a similar but transposed reproduction of 27. 219 clearly shows its relation to 98, developed in more stately rhythm, and the bass of 98 *et. seg.*, is beautifully treated at 223. The cadenza in 233 brings to mind the opening design although it has been remodeled, the basis of 238 is plainly 6, and 244 is perhaps not so plainly an outgrowth of 69. The movement, then, is wonderfully compacted and unified, although lacking nothing in contrast and maintaining the interest without the slightest falling off from beginning to end.

As the work is a sonata—a single composition and not merely a group of pieces in different styles—we expect to find connecting links between the different movements, the development to some extent of one from another. Accordingly we note that the second movement, Adagio, begins with the same melodic idea with which the first movement opens, but in the key of E major. This fact was mentioned in the article in this series on rhythm. The two melodies are by no means identical—to make them so it would be necessary to lengthen the first note of the Adagio, repeat the second and third, insert a G♯ after the fourth and a B after the fifth; yet anyone who will play the first two measures of the Allegro rather slowly in the key of E, and follow them with the first measure of the Adagio, will have no difficulty in recognizing the latter as a development of the former. It will not be necessary, perhaps, to examine the following movements as minutely as the first, but the interesting development of the first measure into the third by reharmonizing and a slight change in rhythm, and then the retrogressive imitation of the melody of the third by the bass of the fourth should be mentioned. 7 recalls 69 of the Allegro. In 13 the left hand plays in the treble a form of the melody from 4. 19 carries us back to the first movement at 116 while showing also its origin from 7 of the Adagio. 53 is a striking development of 1, 68 of 2, 69 of 3, 74 of 8 and 76 of 10.

The Scherzo opens with a development of the first melodic design of the sonata, abbreviated by the omission of the first two and the last notes and the transposition a third higher in the scale. The second voice at its entrance resembles the melody of the first Allegro more closely. The melodic imitation under the new rhythmical form links the movement closely to the opening Allegro, and the entire Scherzo is plainly enough the outgrowth of the idea with which it opens. At 30-31 the treatment of the motive with the skip reminds one of Allegro 91-92, of which it is a development, the dynamic marks being opposite to those of the first movement. The trio is the legitimate offspring of 73 and 223 of the first movement.

The Finale opens with a passage which is much like the opening of the Scherzo in contrary motion, and in its *fourth* measure presents a new rhythmical development of the slow trill of the first measure of the sonata, but treated in a way that recalls the Scherzo. The latter has several places (see 63) where the slow trill is represented by notes on the first and second of the three beats. In the Finale these notes become the first and third of three, and in 8 they become the third and first of three. 9 is an outgrowth of 22 of the first movement, the imitation beginning in the right hand and concluding in the left hand of 10. At 30 we trace a development of a much quieter passage from the first movement beginning at 49. At 56 of the Finale is a passage that is closely related to that in the first movement running some ways from 116. At 104 begins an entirely new passage, but in its development from 112 we see how beautifully it is linked to the preceding portions of the movement. Thorough examination of the movement will be rewarded with as much evidence of its unity in variety as was found in the first movement, and connecting links between all the movements only await the search of the diligent student.

STUDIO—GLEANINGS.

KATE KINGDON.

"Summers of Our Discontent."

I was moving about my little music-room, arranging it for the summer leave-taking, my head filled with plans and prospects for the future weeks. Certain books were selected from my steadily increasing "library," and the compositions I intended memorizing during the vacation days were placed beside them. I took a last look around, surveying the carefully swathed piano and furniture, meditating that my clavier, which had been packed for the journey, would reach its destination before me, and then before darkening the apartment stopped to re-read a letter that had just been handed in. It was from a fellow-teacher, and written from the seclusion of a rural hamlet where she had gone for rest after a particularly trying season. Her surroundings were "ideal," she wrote, and then occurred the following paragraph: "It had never before occurred to me that there might be points of advantage connected with the life of the country music teacher—possibly because I have known little about the routine, or had given it little thought. I have discovered, however, that it possesses, and especially as modelled on the plan of the progressive and determined teacher, advantages far exceeding those of the city studio life. I would be quite willing, I think, to exchange places with the teacher here!"

Among the more favorable circumstances mentioned in the letter—which expressed the discontent of the town mouse in the fable—were the pure, fresh air, and beautiful natural surroundings constantly to be enjoyed, the change of scene and beneficial exercise gained in going from house to house, the plain, healthful living, with its comparative small expense, and above all, the absence of competition with its wear and grind and constant occasion of insecurity.

I sat for a moment in meditation after reading the missive, wondering if instead of the rest and refreshment to which I was looking forward, I was to experience a similar dissatisfaction with my present lot, and return unfitted for renewal of the routine.

A few days later when snugly ensconced among the mountains I received a letter in which the city teacher expressed the amazement a conversation with the country music teacher occasioned.

"I find she has been actually envying me my life in town, and my long summer of leisure, while I, in turn, have been ardently wishing for the girl's firm health, and consequent unflagging energy, which enables her to work on through the season in this region where pupils are stationary, and the absence of income during a long vacation is not added to her list of worries. Think of it!—this unsophisticated one is planning to remove to the city for the sake of 'greater advantages, higher prices paid good teachers, and the time-saving of a studio where pupils are expected to come to the teacher.' Shall I let the young woman have her experience, or endeavor to make clear to her the blessings of her lot, which surely here is cast among the most pleasant and favorable conditions? She makes a fair income, and still has leisure for her own practice, which time I find she improves to the utmost, going to the city, occasionally, for lessons, where, by-the-way, she has imbibed her false notions regarding the city teacher's life, and been inspired, poor child, to build her castles! Truly 'one never is, but always *to be* blessed!'"

And my friend the town mouse, in overlooking her own advantages during the long season when the country teacher does battle with snow-bound roads, cold rooms, and underpay, to say nothing of warfare waged against parents and pupils with "rag-time" leanings, etc., never dreamed of making a personal application of her quotation!

Self-Discipline.

A confession taking the form of a personal reminiscence, made by a prominent organist and teacher some evenings since in my studio, may appeal to many who are struggling with like conditions or temperament:

"The life of a teacher," he remarked, "affords greater opportunities for moulding one's own character on definite lines, than does almost any other profession, and I make the statement from the standpoint of personal experience and observation. I have met teachers who appear scarcely successful in their work, and the reason may, without an exception, be found in some fault or lack in the individual, which he only needs, firstly to recognize, and lastly to set himself to remedy, in order to rise to a higher plane of efficiency, and thus realize better results.

"Upon beginning my work as a teacher in a small town, I had for months, little or no success, and the most discouraging of all was the attitude held by my family. My brothers, who were in business, and becoming successful men, treated me with contempt, and my father and mother, who were obliged, constantly, to eke out my income, considered me as a failure in life, while all expressed openly the belief that I had made a sorry mistake in my choice of a calling.

"I moved, finally, to another town, but the old story of hard luck was repeated, and over and over again I was obliged to write home for funds. Drifting eventually to this city, I opened a studio, placing advertisements in the music journals, and set myself to obtain a position as organist. Fortune seemed at last favoring me. I was engaged as organist in a small church, and pupils responded to my cards; but, alas, as weeks passed, the old conditions seemed asserting themselves. There was constant trouble with the choir, and my pupils were falling off. I sat down alone in my studio, one evening, and faced the situation, determined to solve the problem of my life then and there, for my necessary letters home, containing requests for monetary aid were becoming a greater burden than I could bear up under longer. Here was I, then, I reflected, a man possessing average intelligeece, a musical education both thorough and broad, and having in myself, as I believed, all qualities necesssary to the successful teacher: proficiency, love of the work, ability to impart and explain, patience, unflagging industry and perseverance, but yet I felt there was a lack or defect, which, when discovered, would be shown to be the cause of Fortune's seeming perfidy. I determined to study myself more, and Fate less; perhaps a wholesome indifference would cause the wheel to turn.

"Now to condense the sequel, I did discover what I believe to have been the cause of my ill-success, and at once set myself to remedy the matter. The weak point, or defect, consisted in a certain dependence upon the opinions, and even moods, of others. I was negative instead of positive in this respect. I had allowed the opinions of my family to sway and discourage me. I had bent to circumstances instead of rising inflexibly to assume my rightful place as master. I had blamed fate—destiny, whereas I was my only destiny. Such had become my negative condition that during the hours in my studio, I was swayed by every passing mood of my pupils; at rehearsals by the dominant mood of my choir.

"The recognition was as a flash of light. In the matter of defects we are what we elect to be; slaves, or masters. Steadily, from that hour, have I set myself to walk erect and positive, ignoring none, antagonizing none, yet my old obsequiousness, to the point of servility, gone forever; while results in my life-work have been much that could be desired."

We have grand poems and sonorous prose in our literature, but music is the only art possessing pure harmony that is at once ideal and common.

FOR THE YOUNG PEOPLE

The Young Musicians' Perseverance Club.

Conducted by ARTHUR L. MANCHESTER.

Vacation time is over and we are all preparing to settle down to work again. It will be both interesting and profitable to exchange vacation experiences, and if each member of the Club will write the editor a short letter telling how he or she spent the long vacation, it will bring echoes of the delightful days back to us again. To make this really interesting, all these letters should reach the editor without delay, so sit right down and write your experience now, and send it so it will be in the editor's hands by September 25.

The editor's vacation wasn't a vacation. He kept steadily at work all summer. He attended the M. T. N. A. meeting at Put-in-Bay, Ohio, and went from there to where he has made a new home, keeping up his regular work all the time. He expects to have a vacation next summer. If there are any Club members who did not have a vacation, we can sympathize with each other. But we enjoyed our work almost as well as a vacation, and have no complaint to make. Now, how did each *one* of you spend your summer? Hereafter, when you write to THE MUSICIAN, direct your letters to the editor at Wellesley Hills, Mass., where he has made his home. Don't forget this, or your letters will be too late. Send all answers and letters to that address.

Now the summer is ended and another season of study is begun; we hope you will have the best and most enjoyable year of music study, and will be very far in advance when next summer rolls round. And the Young Perseverance Club will help you.

No names are printed this month because they have not reached the editor in time. They will be included in the October list.

Here are some letters that will interest us all:

Yes, we are well pleased with the success of the Club, but we must put more vim in it this year and see how much we can improve it.

POMONA, FLA.

Dear Mr. Editor—I think the stories in the last two MUSICIANS have been very interesting. I am practicing now some of Rubinstein's studies. I like them very much. They will spread my hands a good deal, for there are some big chords in the music, and I always like to play all the notes if I can. I see there are several new names on our list of membership, and I hope they are as interested in it as I am and I think the Club is succeeding very well. Don't you? Yours truly,

EMMA L. OLMSTEAD.

This letter was written some months ago, but it has not lost its interest. A brave spirit will always conquer, and our friend will surely come out of that corner if she sticks to her work.

HOOSICK FALLS, N. Y.

Dear Sir—Disappointments seem to be my lot this winter. I do not want to make this letter too discouraging, but I will tell about the last and greatest one which came to me. On March 4, I was intending to go to Troy to hear Harold Bauer with the Boston Symphony Orchestra. My ticket, which was obtained with some difficulty, was at last secured, and I was looking forward to the event with great anticipation, when alas! on the very day of the concert I was taken sick and had to stay at home while someone else took my ticket and the rest of the party had to go without me. I have so few chances to hear good music that this disappointment was a very great one. But I do not mean to let it discourage me too much. Although I missed the inspiration which the concert would have given me, I mean to practice and study harder than ever, for I know that the faster I progress the sooner I can get where I can hear all the good music I want to. The last pieces I was studying before my illness were a Romance-Etude, by William Mason, and a Military March, by Schubert-Tausig. I have also been spending some time on a Mendelssohn Concerto. I would like to play it with orchestra some time. My teacher, Miss Gibson, is now a pupil of Dr. Wm. Mason, and so I am studying under his method now. Most of my time is spent on finger-exercises and my repertoire is getting rather neglected. For my next summer's vacation I am looking forward to a visit to the Pan-American Exposition at Buffalo. I wonder how many of the Club-members will be there. I should like very much to meet some of them for I am not personally acquainted with any of them. I seem to be away off in one corner by myself. Perhaps some time I will come out of my corner—that depends on my perseverance. At any rate, I mean to make music my life-work for I love it too well to neglect its study. With best wishes for the Club's success, I remain

Sincerely yours, FLORENCE A. CROSS.

Music Clubs are very helpful, and this one should do our members much good. We hope we also will help you.

URSULINE ACADEMY, WILMINGTON.

Dear Sir—I am very anxious to become a member of the "Perseverance Club," as I am very much interested in the study of music. I take piano and violin lessons and I practice an hour every day on each. We have a Musical Circle here and have our meetings every first and third Friday; we have musical games and have our short program, and look over the pages of THE MUSICIAN. I was advised by my teacher to subscribe for THE MUSICIAN, and I like it very much and intend to try to answer the questions every month. I hope my letter is not too long and that I will see it published. Yours truly,

REGINA MAHONEY.

We welcome our little friend and hope to hear from her often.

ALTON, ILL.

Dear Sir—I am going to write to you and tell you I should like to join THE MUSICIAN'S Club. I am 8 years old and have been taking lessons in music for 2 years. I can play "The Voice from the Heart," "Mother Hubbard Waltz," and a few of the duets from THE MUSICIAN. I will try to answer the questions in THE MUSICIAN. Your little friend, MILDRED RUTLEDGE.

AN ANCIENT ARTIST.

The Temple of Vesta was a high, beautiful building, having a circular roof supported by white columns. From a distance one could see nothing but the columns gleaming whitely through the trees and shrubbery, for they were so many in number, entirely surrounding the Temple and enclosing an immense porch. A long flight of steps led up to the porch, which wound in a circle like the columns, its floor inlaid with beautiful tiles. The Temple stood in a glen at the foot of a shadowy mountain, among vine-covered bowers and rippling streams, and the birds sang here, and beautiful maidens wandered erect and stately through the paths, for they lived in the Temple and kept the fires on its altars burning day and night.

Now it was supposed in those days that an oracle from within the altar would answer questions asked by any one who was in doubt or perplexity and wanted guidance, information about their future or knowledge of any sort, and so people often came to ask questions or to tell their troubles, and went away believing everything would come about as the voice had said. They did not think that perhaps it might be a person sitting always behind the altar, who listed and talked, but believed it was the voice of a god answering them.

One beautiful day, when the sunlight glinted down through the trees and flecked the white columns with shadowy, ever-moving, leaf-tracery, when the birds sang and the flowers bloomed in abundance along the paths, a figure hurried through the grove lying between the Temple and the great city beyond. It was quiet here in contrast with the busy streets he had left, and the peace which seemed surrounding the sacred place made the man sigh deeply, for he was unhappy and ill at ease. He was a great ruler, but cruel and without principle, and now the people were becoming tired of his reign and impatient of his cruel deeds, and even his chosen friends, who had served him long, were turning to join the people against him. No longer could he trust his most confidential friends—Phanon and Sporus—although in his own fashion he loved them and had shown them great favor.

He was going now in disguise and alone to consult the oracle. No one was visible in the quiet grove nor within the Temple, as he mounted the long flight of steps, crossed the beautiful tiled porch and entered the place filled with a solemn peace, and where exquisite perfumes arose from lighted golden lamps and from the purple flames of the altar-fire that burned continually day and night.

Above the perpetual fire a strange white haze, or mist, hovered, enveloping and half screening a harp, which seemed suspended in mid-air, its frame-work of alabaster; ever and anon its glittering, golden wires were swept by invisible hands and gave forth exquisite music. The ruler knelt upon damask cushions and bent his head low upon the altar-rail beneath it, and again there came from it strains, but sad and lamenting now, a dirge in minor key, solemn, prophetic, and at the close a voice intoned, still in the same key, from within the altar:

"Let thine errand be known. I, Atethea, priestess of the immortal Vesta, am attentive unto thee!"

For a half hour the monarch knelt, whispering eager questions, waiting with strained intentness for the replies, while at times the dirge-like music swept from the strings above him. Then, as he bent shivering and prostrate, the voice warned him that it would answer him no more.

"I withdraw, oh doomed one, that thou art! Both by thy crimes and thy follies has thou turned against thee. Upon Olympus the gods have received and committed to eternal happiness in Elysium all whom thou hast slain. Of thy dear kindred, thy mother, to whom thou owest thy throne; thy wife; thy half-brother, Britannicus; of thy friends, Corbulo, the mighty general who saved for thee thine Eastern provinces from Parthnia; Lucan, the rival of Virgil, and Seneca, the most eloquent of philosophers!

"To satisfy the mere whim born within thy savage breast, thou didst secretly order the burning of the noble city, the world's capital, that upon the ruins thou couldst establish one more to thy liking. On the distress of the inhabitants of that burning city thou didst smile, watching afar, from thy castle window, delighted with the magnificence of thy ruin! These are but a few of thy crimes!

"Of thy follies I am minded of thy descent from the dignity beseeming a monarch, appearing nightly as a professional singer in the theatres; of the spectacle of that procession, in which, dressed as Apollo, with a long train of musicians and a crowd of attendants—a thousand chariots in all—the horses and camels being harnessed with silver, and the drivers and riders, clad in the costliest cloth from the looms of Canusium, thou didst enter the city of Naples, upon the day on which thou wouldst sing thy first opera there. These things the people treasure in their hearts against thee. Thou wilt lose thy throne. Thou wilt die ignominiously. May the immortal gods have mercy upon thy soul. That which Alethea, high priestess of the Temple of Vesta hath said, shall be visited upon thee!"

The monarch raised himself and went slowly out from the sacred place, while the requiem music burst forth more loudly, as if in mockery, from the harp-strings. At the edge of the grove he entered his closed chariot and was driven rapidly away.

From that day he determined to bring the prophecy of the oracle to naught. He became more cruel and vengeful and, upon the following morning, arrayed in his royal robes of state and seated on his gold and ivory throne in the basilica of the imperial palace, he dealt out his death sentences to all prisoners who were brought before him, scarcely waiting for the mere form of trial upon which his senators insisted. Among the condemned was a great apostle, whose name was read in the indictment as "Saulus, of Taurus, leader of a sect calling themselves 'Nazarenes,' or Christians,' and charged with stirring up seditions among the people." He was quickly sentenced to be stoned outside the city and was hurried away, bound with chains.

Having dispatched the duties of his tribunal, the emperor hastened to lay aside his robes in his private room, ordered his confidential friend and teacher, Terphus, to be sent to him and, taking his beautiful gold mounted flute from its case, began his usual morning practice. When Terphus entered the two withdrew to a still smaller room, with padded walls, and here the emperor told the old man of his visit to the oracle and of his plans to evade the fulfilment of the prophecy.

"I am already a famous singer and have mastered all the known operas. Also, I can perform excellently on any instrument, as thou knowest. Therefore, I will forthwith live only for my art. Disguised, first as a minstrel, afterward, when far from this intriguing people, as a famed musician, I will take my place in the musical world. Thou, also disguised, must accompany me in my flight."

Alas, for these plans so cunningly laid! Turning to the history of those times we learn their ending.

1. Who was Vesta?
2. Of what was she goddess?
3. What was an oracle?
4. What was the name of the emperor who went to consult the oracle?
5. Give dates of his birth and death.
6. What great city was burned under his orders?
7. Did the oracle's words come true?
8. What is a *dirge?*
9. Who was Apollo?
10. What great Apostle is mentioned in our story?

Three blissful words I name to thee,
Three words of patent charm,
From eating care thy heart to free,
Thy life to shield from harm—
Pray—work—and sing.

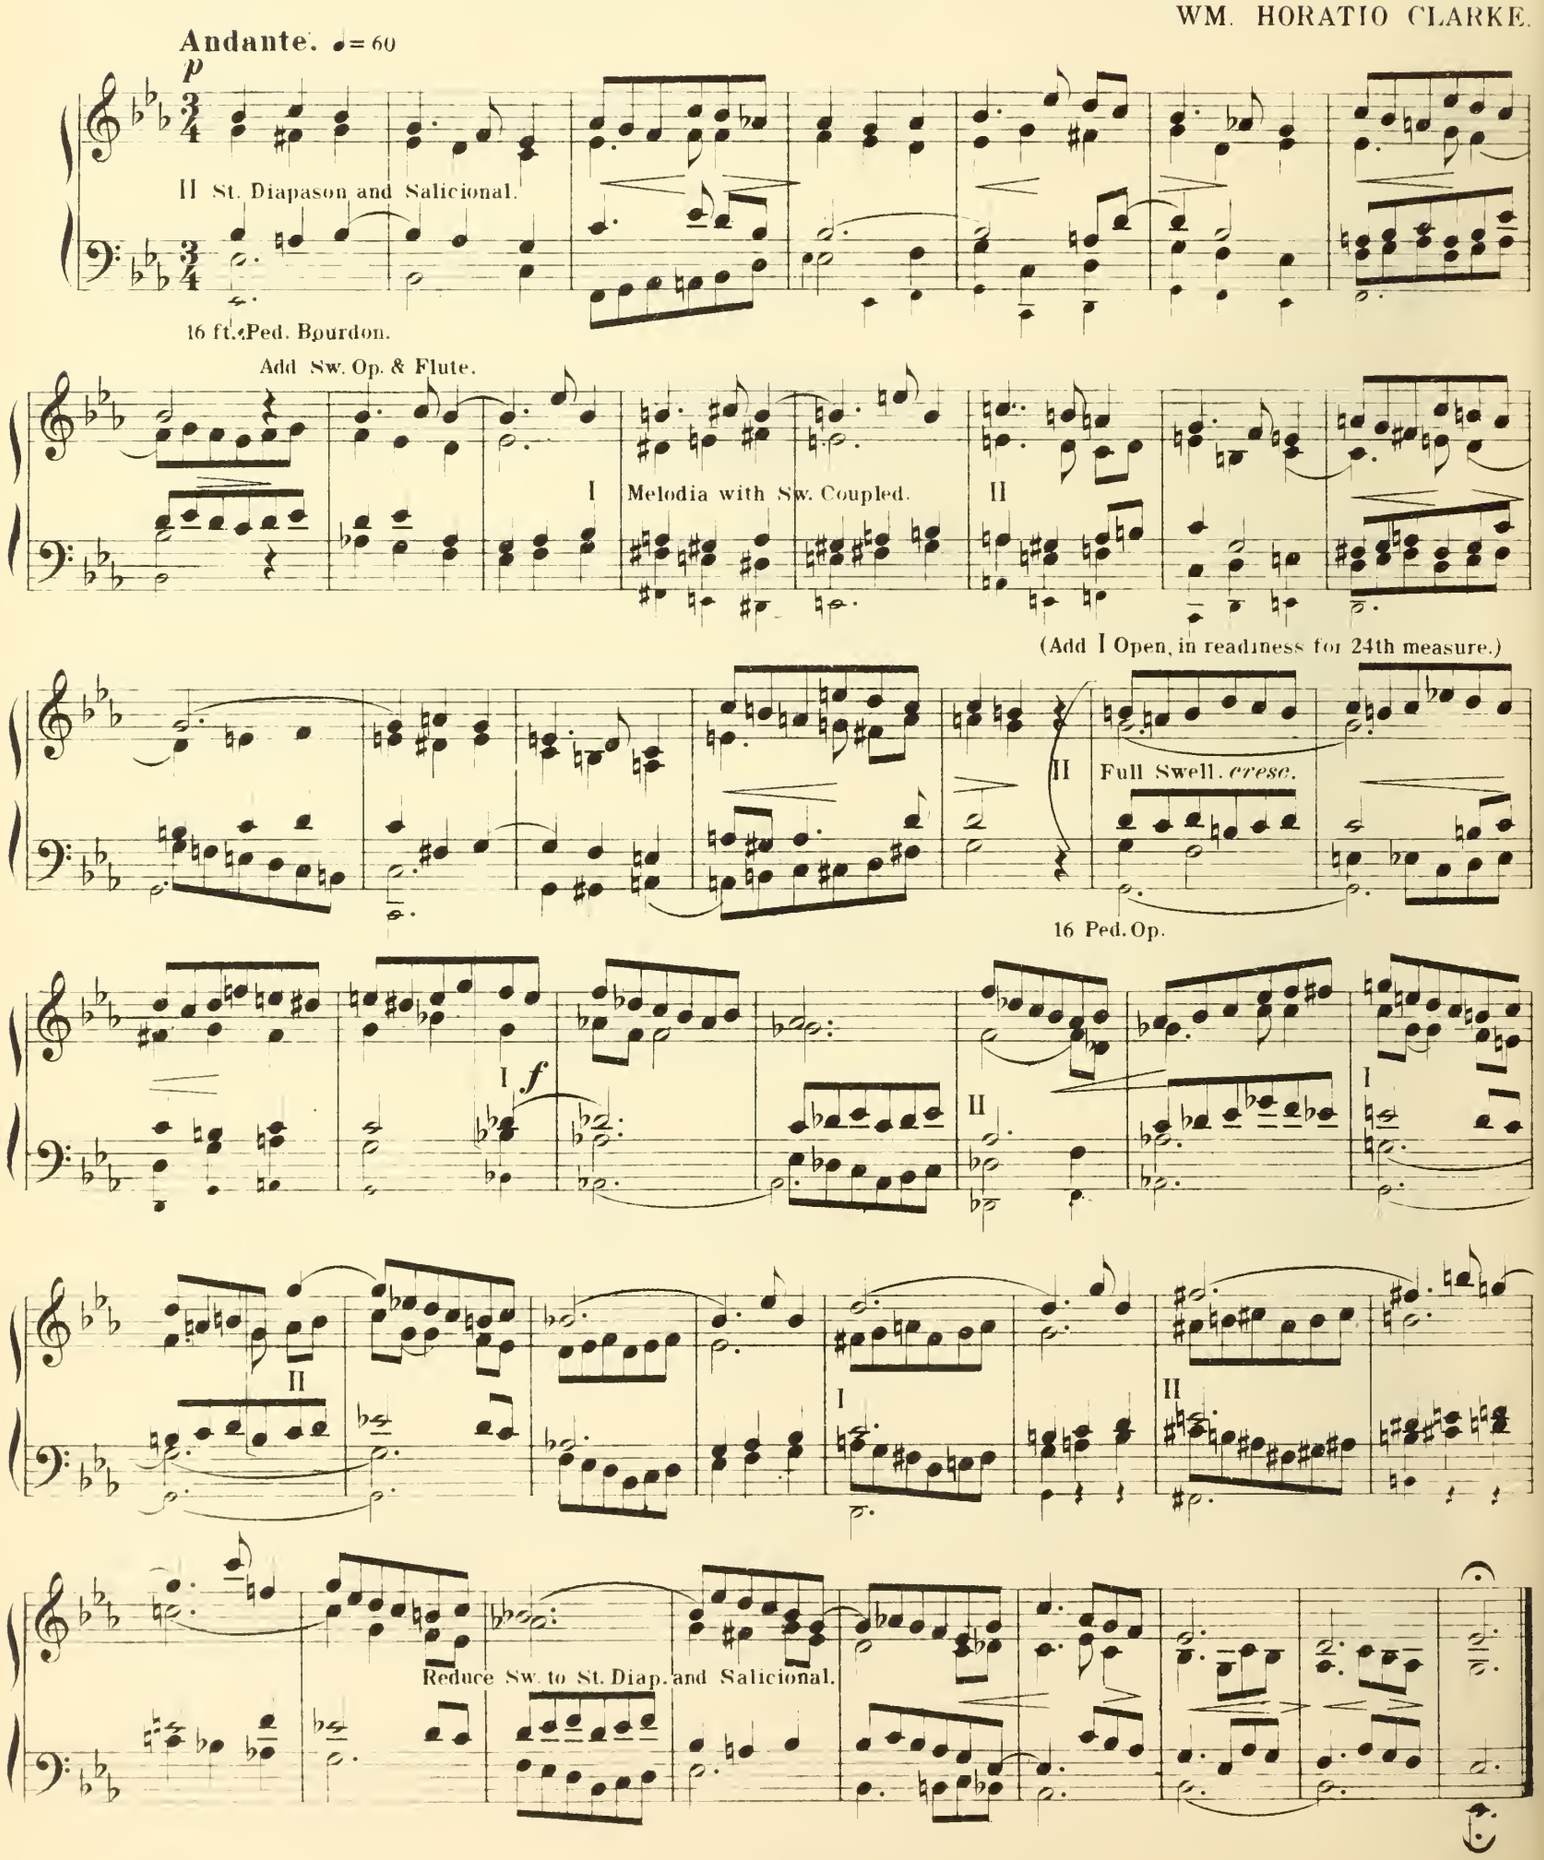
MEDITATION.

WM. HORATIO CLARKE.



WOMAN'S PAGE

Conducted by Miss S. C. VERY.

DA CAPO.

The year books of 1900–1901 continue to arrive from all parts of the country accompanied with the request for "hints as to a different line of study." The program of the young club, few can boast maturity, starts, as it were, a wheel along the broadest, most beaten path, whose course is completed in one season; a score of little by-paths are passed by unnoticed, many a "sequestered nook and mossy glen" invite to rest and to refreshment, unheeded in a mad race. At the terminus the club asks: "What now is left for us? Where is a different line?"

Paradoxical as it seems, in repetition might be found the wished-for variety. A rendering Da Capo would afford much diversity. To our musical enthusiasts we would say, that in a canonic repetition of the theme of the year, with different voices leading and different minds phrasing, much charm, unnoted by the way, might be discovered.

One youthful club announces at the beginning of its program, the subject, "Music's History:" disposing of this in "one fell swoop," the valiant band passed on to wrestle with twenty other weighty themes before the "May meeting for election of officers." Now as the "atom" in the scientist's definition is not "simple, not ungenerable, unalterable and indestructible; but heterogeneous, made up of smaller particles," so many a figure looming above his fellows in that music history, is hardly to be gauged proportionately by flitting reference to dates of birth and death and catalogued list of compositions. Lay aside the terse biographical outline; even his compositions; study his environment, the civic conditions of his time (usually novel to Americans), his home influences, a course so discerningly followed by Hadow; then, not alone will his work be better appreciated but the call for him, as the epoch's leader, shown.

An axiom has been formed in the club-world with advancing years, *i. e.*, in diverse ratio to a club's age is the number of studies undertaken; and the elder club's year book has a very concise look as to topics, though its calendar of dates be lengthy.

"We women must come by degrees into our kingdom," writes Marion Harland. "Our grandmothers and our greatest-great-grandmothers had no voice in the management of general reform, social or political. 'Theirs not to reason why' the mills of the men ground slowly, and creaked discordantly, and sometimes gave out entirely. We cannot hope to gain in half a generation what our big brother has not quite mastered in a thousand generations. If he might learn patience, tenderness and tact from us, together with the whole-souled earnestness we carry too far sometimes, we may go to school to him in other matters. We may acquire the habit of dispassionate weighing of evidence; the art of making haste slowly; of taking nothing for granted."

INTERESTING SIDE LIGHTS ON WOMEN IN THE MUSICAL WORLD.

Kate Vannah, distinguished as a composer, is known also as a facile writer and clever sonnetteer.

Miss Hannah Smith, author of "Music: How it Came to Be What It Is," has published, also, musical compositions of educational value.

Madame Bergdorf, a successful exponent of Folk Lore in Song, is a friend and correspondent of Sada Yacco, who sent her recently from Japan announcement of a new play in which she and her husband are to appear.

Blanche Marchesi, the singer, who this year made her debut as Brunnhilde, is an accomplished violinist and writer.

NEW PATHS.

The programs of two musicales given at the close of the past season, indicate an exit from the beaten path of musical recitations into the broad avenue of approach to ripe musicianship. One took place at Sing Sing, New York, in the home of Mrs. Francis Larkin, where two pupils of Miss Huse, after rendering respectively, "Hark! Hark! The Lark," by Schubert-Liszt, and "Regata a Veniziana," by Liszt, took, in turn, the piano part of a Trio; the work played was Gade's Novelletten, Op. 29, the 'cello and piano part being rendered by the Misses Pilat and Dressler. To the progressive methods of Miss Huse, is credit due for fine achievement.

Another musicale was given at the invitation of The Athol Club in Massachusetts, by the pupils of Miss Carrie Delle Hosmer. On the program, beside the name of each composer, were the dates of his birth, and—if not living—of his death. The entertainment took the form of a lecture-recital, each number of the varied and well chosen program being preceded by a few interesting remarks by Miss Hosmer, in relation to the composer whose work was to be presented, or explanatory of the piece itself. The playing was distinguished by fine musical feeling and by a surprising clearness of technique. To an audience which filled the hall, was evident. not a display merely of "technique" which astonishes, but of musical appreciation which augurs for the future of the young students, that intelligence, without which, there never can be fullest enjoyment of the art.

CLUB CHAT.

"We desire to go on." The way is interminable.

"We wish an instructive and interesting program." What club of other aims, can offer as much in above combination, as the music-club?

"We desire more than pleasure." Such a sentiment is inscribed upon the banner of clubdom.

"My ideas are about used up." Yet your program shows but the conventional line of club-students, similar to those of literature, art, etc., *i. e.*, history, biography and illustrations; why not investigate acoustics? Study the treasures in ensemble music with strings and piano. Read of the æsthetics of music. The fascinating story of Greek music has recently become more interesting by excavations.

CORRESPONDENTS' COLUMN.

"Will you name some light music for mandolin, guitar and piano?" "Orientali Perfumi," by Bellanghi; also, "A Night in Venice," "L'Addio a Napoli." "Serenata Maggiore," by the same composer.

"Can we use Händel's ode (Dryden) on St. Cecilia's Day?" You can for the chorus, substitute a double quartet.

"Name some music for eight-hands." A progressive eight-hand club sends the following program:

Schubert—Unfinished Symphony.
Hoffmann—Novellette.
Gounod—Friedensfeier.
Brahms—Hungarian Dances.

PROGRAM FOR MUSIC CLASS TO BEGIN OCTOBER, 1901.

The Development of Music as An Art.

1. "The Beginnings of Music as An Art." 600 to 100 A. D.
2. "The French School and the Birth of Counterpoint." 1100 to 1425.
3. "The three periods of the Netherlands School, and the Golden Age of Counterpoint."
4. "Development of Folk Music and Its Influence on Great Composers."
5. "Causes which led to the Simplification of Music and Birth of Modern Instrumental Composition."
6. "Secular Music of the Middle Ages." (Paper to be loaned by Reciprocity Bureau.)
7. "Typical Forms in Music."
8. "Climax of Polyphonic Period." Johann Sebastian Bach. 1685 to 1750.
9. "Development of Monophonic Style and the Sonata." E. Bach, Haydn.
10. "Evolution of Piano Music." Mozart.
11. "Rise of Opera." (To be loaned by Reciprocity Bureau.)
12. "Evolution of the Oratorio."

Branch of Women's Club, of La Grange, Ill.

SOME DIFFICULTIES CONFRONTING AMERICAN WOMEN ARTISTS.

The following excerpt from *The Concert-Goer* is both aggravating and encouraging. It points a moral very effectively.

The boycott established against Mme. Alma Webster-Powell, by native singers of the Berlin Royal Opera, and which finally forced a resignation from the American singer, affords an example of petty jealousy worthy one of our own musicians' unions. Incidentally it makes a mighty poor return for the generous welcome that we of America have given to a score of German singers who have figured in our opera seasons for several years past. The extreme jealousy of the German singers against Mrs. Powell, is really a high compliment to her ability as an artist. It was the dog-in-the-manger howl that mediocrity always raises against more gifted and better equipped artists. Mrs. Powell's crime was that of singing too well. A considerable part of the Berlin public showed a keen appreciation of the young American woman's art, and this created a panic in the ranks of the stolid mediocrities of the opera company. In order to check the advance of Mme. Powell these native singers planned a convenient illness whenever she was cast for a performance, so that it always became necessary to change the bill. In this way Mme. Powell was prevented from an appearance; and since there seemed no likelihood of relief, she gave up her position in disgust.

The first impulse upon learning of this contemptible conduct upon the part of Berlin singers is to cry retaliation by withdrawing our support from the German singers who annually occupy such conspicuous places in our own opera. But sober consideration does not sustain such a policy. In art there is no place for boycotts. They may be left to bakers and milkmen—and musical unions—which have nothing to do with art. But let us hope that the narrow-minded singers of the Berlin opera will learn that the decent way to make themselves secure in public regards is to maintain their own art at a high standard, rather than to conspire against those singers becoming of their number who show a better equipment than themselves.

For Americans this incident has its lesson. If we produce singers who, like Mme. Powell, can go into the very art centers of Germany, handicapped by the use of a strange tongue, and immediately establish their superiority over the native singers, it would seem the part of common sense to give them a hearing in our own opera, instead of importing some of the very foreign mediocrities whom they eclipsed. To this extent, at least, we may preach "America for Americans," with no danger of being charged with jingoism.

TO-DAY.

To-day
Unsullied comes to thee, new born;
To-morrow is not thine.
The sun may cease to shine
For thee ere earth shall greet its morn.
Be earnest then in thought and deed,
Nor fear approaching night;
Calm comes with evening light,
And hope and peace. Thy duty heed—
To-day. —*John Ruskin.*

ORGANS CARRIED IN TRUNKS.

"In *The Sun* a while ago," said a manufacturer of organs, "I read an interesting paragraph about a trunk that a New York manufacturer had made for an organ that was carried around the world by Ira D. Sankey, the singing evangelist. He carried the organ with him so to be sure to have one to use wherever he wanted it, and he had that trunk made for it to insure its safety in transportation, and to make it easy to transport instead of boxing and unboxing it every time. They used to carry this organ in its trunk right onto a stage and just open the trunk and throw the top and sides back, and there was the organ ready for use.

"Very probably that organ trunk made the longest continuous journey of any ever made; but I guess you would find a dozen, or dozens of organs toted all over this country in trunks made to carry them in. These organs are carried by theatrical and other traveling entertainments. It might seem as though an organ could be found anywhere in the country, but as a matter of fact that is not so. Carrying an organ along they avoid all difficulty and have just what they want. And if you could get them all into a bundle together I guess you could gather up something like a carload of baggage consisting of organs carried in trunks."

A LESSON IN FORM.

HARVEY WICKHAM.

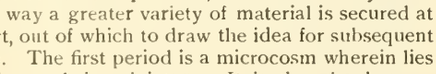
The study of form is essentially a study of rhythm. Harmony and melody are used to embellish and emphasize the relationship between tones and groups of tones, but the essential factors are duration and accent. A composition may be completely analyzed after it has been reduced to a single chain of notes upon one degree of the staff. The student will do well, therefore, to bear in mind that throughout the study of this branch of musical art (and a most, if not *the* most, important branch it is), his attention should be focussed upon the element of rhythm, using the word in a broad sense.

The history of musical form is the history of the conservation of invention. It is the history of the endeavor by all composers of all ages to make a little idea go a great ways. The greatest masters are the most niggard of themes. What a novice will master in a song the savant will spin out into a symphony. This may seem paradoxical and strange, but it is upon the same plan that nature herself works. Did you never note how few, how exceedingly few, are the elemental structures in creation? The fin of a fish, the wing of a bird, the fingers of a pianist, what are they but three variations upon one theme? The whole universe seems to have sprung from but two germs—substance and emotion. Yet what wonderful variety, what a grand sonata-piece, in fact, is the world.

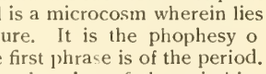
A brief review of some of the expedients devised to prolong an initial concept may be interesting. The most obvious and ancient is simple repetition. Write a group of notes twice over and your composition is doubled in length. Invent a second group and conclude by a recapitulation of the first and you have a piece four times as long as at the start and containing three grains of unity to one of variety, a nice and satisfactory proportion. Also will have stumbled upon a crude form of musical period, the generally accepted perfect unit of musical diction. The halves of the period will bear the name of sections, and the halves of the sections, the name of phrases; and the halves of the phrases, the name of motives; the halves of motives, if divisible at all, the name of germs. Further than this analysis cannot go, for with the division of the germ, which may consist of not more than three nor less than two notes, disintegration ensues, and we have passed from music to acoustics. The germ is the molecule as the tone is the atom of audible chemistry.

The subdivisions of the period do not always follow the scale of two, as any one of them may be, though less usually, composed of three parts, and even (in almost unique instances) of five or seven. Observe that I have worked backwards from the period to the germ, and not (as is generally done) forward from the germ to the period. This will always be found to be the best course in undertaking the analysis of a composition. First, note its division into movements. Then the grand division of the movements, whether into one, two or three parts. Then the subdivisions to the minutest detail. Otherwise, it will be found often difficult to assign a name to a particular group. A certain series of tones may be either a motive or a phrase, according to the manner in which the composer has used them. The motive of a long phrase may thus itself be capable of division.

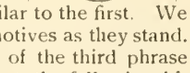
In general, a motive extends for about the space of one measure, a phrase for the span of two. Also, it is of practical importance to remember that the rhythm of the second measure is usually unlike the first, hence the common expression, "bi-measural rhythm." In this way a greater variety of material is secured at the start, out of which to draw the idea for subsequent periods. The first period is a microcosm wherein lies the entire work in miniature. It is the phophesy o the movement, just as the first phrase is of the period. A period composed upon the plan of the primitive one mentioned near the beginning of this paper will afford a surprising opportunity for subsequent combinations. Let us suppose that the first phrase runs thus:



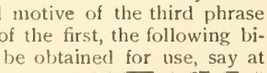
and the third phrase thus:



the second and fourth being similar to the first. We have six kinds of notes and four motives as they stand. By combining the second motive of the third phrase with the second motive of the first, the following bi-measural rhythm would be obtained for use, say at the beginning of the second period:



By writing the members of the second part of phrase one in inverse order, we get this suggestion for future development:



Composers thus combine little groups into big ones, as I have advised the analyst to "*decompose*" big ones into little. In building a house, the part first constructed is the foundation. In tearing down a house, the part demolished is the roof.

To revert to the expedients to prolong compositions while economizing themes, let us suppose that we have perfected a period, how shall we proceed? One way will be to repeat it, note for note, but here variety is sacrificed. If it is a vocal composition it may be sung over and over again, the words supplying the element of change and the result being a primitive ballad. Or, if it be a work for instruments, we may repeat it so far as important and essential elements are concerned, but vary it in other particulars. Here arises the "Theme with Variations," a venerable and withal very important form, notwithstanding the sins that have been committed in its name. A variation must bear some tangible relation to its parent theme, though in the course of an extended work of this kind it is advisable to have some of the variations rather far-fetched, as it were. The simplest form of variation preserves the general outlining tones of the melody, but puts passing notes and embellishments between. For example:

is a very simple variation of

since the original tones still fall upon the same parts of the measure. Change of key, change of mode, regular and irregular elongation and contraction of rhythms and different harmonizations and accompanying figures will be found in the course of fine works of this class, together with innumerable ingenious stratagems to secure variety. The student is referred to Mendelssohn's "Variations Serieuses" as a consummate example.

Instead of repeating our original period with variations, we may indite another period, or several periods, using enough related material to obtain unity of effect and injecting enough of what is novel to avoid tediousness. The composition will then be in the Song Form, after the manner of most of Mendelssohn's Leider Ohne Wörte. Perfect examples of almost every form may be found in profusion among the works of this master, as he had a wonderfully developed sense of symmetry, even if he did make a slip in the Spring Song and leave out a needed measure or two.

If a period be repeated with an interlude interpolated between the repetitions, the genesis of another interesting form will be found. It is probable that some ancient troubadour, while elaborating upon his instrument a passage to rest his voice in the course of one of the interminable ballads of that day, stumbled upon this sort of composition, called to this hour the "Applied Song Form." The plan of this style of piece is simply this: Theme, Interlude, Theme, with the interlude developed into the proportions of a distinct movement. Gottschalk's "Marche de Nuit," is of this character, as indeed are nine of ten piano works of moderate length.

By modulating into a related key by means of the interlude and announcing the second period in this new key, a hint is had as to the beginning of the sonata, but a discussion of the sonata will require another essay, as will the subject of Polyphony, whereby interest is prolonged by the echo or imitation of the original subject by different parts of voices, leading at last to the invention of the Fugue.

Historically, the fugue antedates nearly all species of song form if the attention be confined to the music of the learned. But, as a matter of fact, single monophonic dance tunes and the like were in vogue among the common people from very early times. I can therefore be pardoned for mentioning the subject of fugue at the end of the list.

In the foregoing I have endeavored to give the student a few hints as to the dissecting of the works of others, rather than any advice to young composers as to the putting together of compositions of their own. That also will have to be left to another article.

The barriers are not erected that can say to aspiring talents and industry: "Thus far and no farther!"—*Beethoven.*

ACQUIRING SOULFULNESS.

HERBERT G. PATTON.

Recently two bright-looking young ladies entered and took a seat in a railway car. Evidently they had been discussing a recent musicale, for one resumed her conversation with the remark: "Yes, she's an excellent pianist, but her playing is so mechanical—not a bit of soul in it." The writer, who overheard the conversation, did not smile, for he thought of the victim of the criticism and pictured her a painstaking artist, doubtless striving to play soulfully, yet finding it impossible to instill that mystical spirit into her music. Probably she was born without a poetic temperament or a power of imagination by means of which she could live through some emotion for the moment as if it were an actual reality. If technical execution is all that one hears in a composition, it descends to the level of a music-box and is as dead as the human body from which the spirit has winged its flight. The question nearest the heart of a player conscious of her need is, "*How can I acquire soulfulness?*"

Here is a problem with which no one feels capable of coping; yet it must be answered in part, else the highest musical development becomes stunted. To define soul is as impossible as to describe the wind. It is a spirit, a feeling, an attribute—intangible, but nonetheless powerful. Those who possess it have certain characteristics which we know are as necessary to its existence as water to the formation of vapor. Many are born with latent talents which are capable of wonderful development. It is the same in the case of soulfulness. Music possesses so great a variety of sentiment that there are few players but can put feeling into certain compositions suited to their personalities. Those who, like a fine actor, can imagine themselves anywhere or under the influence of any sentiment or passion are the greatest artists.

No wonder we were thrilled by a great tenor's solo, "Let Me Like a Soldier Fall," for on his cheek was the scar from the cut of a saber and the song was a sentiment from a brave, patriotic heart. A cruel, selfish, unsympathetic nature cannot give the highest interpretation to many compositions. We must learn to pity and help the distressed; to shed a tear with the sorrowful; to appreciate the beauty and grandeur of nature and to acknowledge the existence of a Divine Being before we can feel the sentiments of a composer. Can an Atheist appreciate the heavenly grandeur of the Pilgrims' Chorus which put to flight the impious tempters of Tannhaüser? Can a base character present that which is pure; or the coward sing a song of triumph? There must be a personal relation between the heart and theme or interpretation becomes mimicry.

Part of the successful portrayal of a theme must rest with the hearers. There must be sympathy or there will be no responsive vibration from the chords of the heart. The National Hymn wafted to the deck of an incoming vessel is far sweeter to the ears of the crew than when her prow was pointed towards the horizon.

The soulful player has mastered the technique of his selection; he has no fear of the audience. His mind and heart are upon a theme of gladness or sorrow; a battle for liberty; a passionate serenade, or the harping of angels around the throne. His nerves tingle; his blood surges; he is intent on a portrayal of the subject. The audience listens, grows more interested, and at last is swayed by the same emotions as the player.

He who would thrill others must himself be thrilled, and to be thrilled the heart must be attuned to the heart of the composer.

"Music is like a glass set in a niche
The which
Equally saint or sinner doth reflect,
And each one passing sees his own aspect.
If a beast pass he sees
His beastly self; but shall an angel look
Upon the glass within the lonely nook.
White draperies floating shine and waving wings
The glass its own sweet image backward flings."

"A young lady whose musical studies might be said to lack a deep foundation, wanted to look at some pieces for the piano. The presiding young man at length offers her a composition saying, in a half hesitating manner, 'But perhaps you would not care for this, as it is in five sharps.' 'Oh,' was the unexpected reply, 'that is of no consequence, when there are more than two I never play them!'"

HABITS OF ACCURACY.

FRANK L. REED, A. C. M.

Accuracy in a general sense depends upon the exact adjustment of means to ends, the ordering of one's acts with regard to the law of cause and effect, and above all upon a determined will to work out to an inevitable end the logical conclusions of a well stored and well regulated mind.

What does the term mean when applied to music study? Let us go immediately to the root of the matter and recognize that the accuracy of any act, or series or succession of acts, depends largely, if not altogether, upon accuracy of thought, or what Herbert Spencer calls *exact-thinking*, and the determination to realize this thought in action. What right have we to expect the fingers to strike a certain key, or to stop the string at the proper point, or the vocal chords to sustain the proper tension, if there is not back of the muscular effort a definite and precise thought and a determined will to execute the thought. Some one has said that, "Thought is Act in Fancy," in other words, thought is an unexpressed, or rather unmanifested act.

*In*accuracy in piano playing arises from indecisive mechanical movements which result from indefinite thought. In practice, the emotional elements of a piece must be excluded as an active cause and must be subordinated to the acquirement of a faultless mechanical execution, else "wrong notes" are sure to be heard. When mechanical certainty is assured, then the proper means of expression for the musical content of the piece may be studied, and later the attempt to reach the true inwardness of it may be made.

If we closely observe a skillful pianist strike a key we will see that the apparently simple act is in reality a very complex affair made up of a great number of minor acts, some occurring simultaneously and others in rapid succession.

In simply adjusting the hand to primary position think of the number of acts involved, each governed at first by a conscious thought!—fingers curved, knuckles flat, or slightly depressed, wrist flexible and on a level with the back of the hand and making no break in the line from the knuckles to the inside of elbow joint, thumbs extended, raised and curved towards the palm at first joint,—at first this position was very difficult to assume, but as each element passed under the control of a clear and definite thought it became easier and eventually habitual and capable of infinite variation and modification. Each lesser act at first practiced with a conscious thought, by continued repetition became merged into the one thought or intention of striking the key and so became automatic.

In order to develop a habit of accurate technique in piano playing it is necessary to recognize that at first a conscious thought directed by the will must govern every mechanical movement involved, and that this procedure must continue until the directions and successions of the various movements become instinctive and appear to be but a simple expression of one clearly defined and determined thought. Thus an act, or series of acts, becomes automatic, and having passed under the control of the sub-conscious mind we say the person has a habit.

An accomplished pianist, striking a single key, calls into play a great number of muscles. With the determination there arises a general preparation of the entire muscular system, and from this down to placing the hand in position over the keyboard there is a gradation of muscular acts that we leave to the pupil to discover.

The stroke of a key whether with the finger alone, or in combination with the hand, forearm or entire arm may be roughly divided into three elements,—the lift, the preparation, and the attack; besides these there is the nervous grasp of the key by the fingers, which endures for a longer or shorter time, and the release which is equivalent to the lift in the next series of movements. All these movements must at first be practiced consciously and rhythmically. Upon the proper adjustment of these elements to each other depends accuracy in piano playing; the proper adjustment depends upon the mental grasp of the mutual relations of these elements which in turn is determined by exactness and clearness of thought.

Assuming that the pupil has mastered these elements of technique so that a piece may be attempted, let us proceed to the application of them in practice so as to develop the greatest degree of accuracy.

Following the intention of striking a key comes the choice of the key,—if reading a piece of music and the choice is made for the player, the thought of the note is of no less importance; suppose the print is inferior and the player is unable to decide whether middle C or D is intended; if he attempt to strike C while still uncertain the attack of the key will surely be affected, but most likely both keys will be struck in answer to the wavering state of the mind, or perhaps B, or C♯ or D♯ or E may be sounded simply because there is no exact thought of the note and so we have one cause of *in*accurate playing.

But one may choose the note or key with certainty and clearness and still remain woefully inaccurate, because the muscles have not been trained to answer to the physical movements required in the technical execution. The training of the muscles in the acquirement of the purely mechanical side of technic requires the most exact thinking, if there be any degree of comparison possible. What follows applies equally to the virtuoso and to the beginner.

Practice each hand separately with every mechanical movement of the fingers, hand and arm thought out and the principles of lift, preparation and attack applied. When each hand has in this manner become somewhat acquainted with its duties, select the more *difficult* places and give them *extra attention*, playing some phrases or figures over from *fifty* to *one hundred* times, transposing them into many other keys and in different registers *retaining the same fingering throughout.* Increase the tempo little by little as the skill increases. Rest each hand and arm while the other works. Later, practice both hands together so that their interdependent actions may become familiar and easy, reverting to the slowest tempo; occasionally revert to the one hand practice and only at the last, increase the tempo to the indicated or required degree. Such practice precludes the possibility of premature rapidity and is the secret of slow and successful practice.

Another prerequisite in acquiring a faultless mechanical execution of a piece or exercise is the close and studied adherence to a given fingering. At the very beginning the fingering should be decided upon and never thereafter departed from, remembering that that fingering which is at first easiest is not always at last the most reliable. More often the best seems awkward at first, as the logical demands of the musical figure or phrase takes precedence over any succession of fingers that may then seem most convenient. Very few concessions should be made to the difficulties presented by the unequal arrangement of the black and white keys. All sequences and similar figures should retain the same fingering with few exceptions. The fifth finger succeeding the thumb, and the thumb the fifth finger more frequently employed in scales, and arpeggios founded upon the seventh chords, or triads with passing or neighboring notes; this even at times when the thumb or fifth finger is obliged to take a black key after a neighboring white one, or vice versa.

The conscientious application of these few details of fingering with the general principles enunciated above cannot help but conduce to greater accuracy in piano technique.

QUALITY OR QUANTITY.

FREDERICK A. WILLIAMS.

There are pupils and parents who are too apt to value the teacher for the quantity of work done, rather than for its quality. Some parents are too apt to think that if the pupil is not given a large quantity of *new* work at each lesson they are not getting their money's worth, and if the pupil is obliged to take the previous lesson over in order to correct mistakes, and is not given the usual amount of new work in addition they begin to think there is something wrong with the teacher.

This sort of people is always satisfied with the teacher who gives *big lessons*, but do not stop to consider that the teacher who gives a lesser number of pages and insists on having the work done in the right way, is the one who is earning his money. I have often had pupils come to me for instruction, after they had taken lessons a year or two of some teacher who evidently had tried to see how large a quantity of studies the pupil could *go through* in the shortest possible time. These pupils would have many books of studies, which they had *gone through*, none of which, however, they would be able to play correctly. They had simply been given an amount of work to do in a year or two which, if properly studied, would have taken twice as long to accomplish.

Any good teacher would rather take a beginner any day than a pupil who thinks she is advanced when she is not. As a rule, the pupil who has only taken lessons about two years and has gone through a good many of the standard pianoforte studies, has attempted to play Beethoven, Chopin, etc., naturally thinks she is advanced, but how hard it is for such a pupil to be obliged to start at the beginning again in order to get on the right track and do good work.

If parents would only be careful and select a competent teacher to begin with, trust to that teacher's judgment and think more of the quality of the lesson than of the quantity, there would be fewer disappointments to both pupils and parents, and the results would be very much more satisfactory.

ORIGIN OF RAG TIME.

"The approaching end of rag time, as indicated by the recent decision of a musical union at Denver to abolish it, suggests the true story of the origin of the name," said a music publisher. "It has never been printed. About ten years ago a young fellow named Ben Harney went to a party given by colored folks in a suburb of Louisville. While he was there two darkies, who were experts on the banjo, began playing.

"While they were playing Harney noticed that the rhythm produced by the two banjos was peculiar, but very catchy. So after a while, when called upon to play something, Harney ran his fingers carelessly over the keys of the piano and tried to imitate the time made by the two banjos.

"At first he failed, but before the night had passed he had acquired the time and kept the crowd entertained with snatches from popular songs played in this fashion. One of the darkies who had performed on the banjo became suddenly interested in Harney's playing. Approaching Harney he inquired:

"'Marsa Ben, wha' am yo' playin' dar? Dat am de funniest kin' ob tune I'se ebber heerd.'

"'I don't know what it is myself,' replied Harney, in an off-hand way. 'I suppose if I had a dress suit on, like some of these actors at the show, I might give it a nice, fashionable name. But as it is I can't think of any name in these rags and you will have to let it go at that.'

"The darkey sized Harney from head to foot. Harney's clothes were neat and fitted him well. The negro thought the argument a poor one and said:

"'What's de diffrunce wha' kin' ob rags yo' plays in, Marsa Ben? Yo' kin allus git er name fo' it. I'se tells yer Marsa Ben, dat Ah am very much in lobe wid dat tune.'

"About a week later there was another party in the neighborhood. Harney was present and had to play. The two banjo players were also there and they thumped away together, playing all sorts of tunes. The same darkey who a week previous wanted to know the name of the measure Ben was playing abruptly arose and, turning to the guests with a merry laugh, said:

"'Ladies an' ge'men. Marsa Ben Harney has got some ob de most peculiarist kin' ob music dat I ebber heerd afo'. An' I'se begs yo' kin' 'dulgence fo' t' hyar it. I'se don' know de name ob de tune, but it am de lobliest I's ebber heerd.'

"Ben thought the remark very funny and replied. 'What do you mean, Jasper? That music I played in those rags last week?'

"'Yes,' returned Jasper, enthusiastically, 'dat rag-time music.'

"Well, after that rag-time became the real thing in the town, and when Harney came East he introduced it in New York, and it soon was the rage all over the country. And the name rag-time has clung to it ever since."

Greatness means strife, for men and nations alike. A soft, easy life is not worth living if it impairs the fiber of brain, heart and muscle. We must dare to be great, and we must realize that greatness is the fruit of toil and sacrifice and courage.—*Theodore Roosevelt.*

The emotional force in women is usually stronger, and always more delicate than in men. Their constitutions are like those fine violins which vibrate to the lightest touch.—*Haweis.*

VIOLIN STUDY—COMMON SENSE TRAINING.

GEORGE LEHMANN.

In violin playing, as in singing, there is so much that is difficult to define and to grasp that the general run of teachers and students are easily led into extravagant reasoning in their efforts to elucidate and to understand. Often their reasoning may be interesting, at times even instructive; but they rarely discover truth, which lies close at hand, preferring, for some enigmatical reason, to cling to wild speculation, which generally leads them nowhere. Every experienced artist knows that common sense reasoning applied to art is productive of the best results; but this very common sense is such a rare possession that we seldom find it even among those who possess in abundance what is ordinarily termed intelligence. A grain of common sense is often worth more than a lifetime of theorizing, "If common sense has not the brilliancy of the sun it has the fixity of the stars."

In former days there lived in the United States a teacher who proclaimed the distinction of being a pupil of Spohr. Spohr was his musical God. Though not an unintelligent man, his blind devotion to the memory of the great German violinist led him to adopt a method of instruction at once disastrous and incredible. He would initiate the talented beginner into the mysteries of violin playing by "guiding" him, in from six to eight months, through Spohr's well-known method. When the pupil would reach the last page of this interesting volume the pious disciple of Spohr indulged in a prodigious quantity of snuff and gravely announced that "now we must review this whole work from the beginning." Accordingly the pupil struggled once more through the mass of intricate technic, consuming, in doing so, perhaps another two or three months. This happy termination of the student's "rudimentary" work was followed by a course of discipline really startling in conception and in the rapidity of its procedure. The task set before the pupil was nothing less than the mastery of Spohr's fifteen concertos! These concertos the pupil endeavored to play in the order in which they have been published; that is, he began with the first concerto, and, regardless of all musical and technical considerations, scraped through each successive concerto with the laborious zeal of a fanatic. When finally these fifteen concertos were "mastered," the pedagogue prescribed the various concertos and solo pieces with which modern artists are acquainted, and ended his professional duties by sending his pupil to Germany for "the finishing touch."

The writer wishes earnestly to state to his readers that he has not exaggerated, in the least degree, the pedagogical illusions of this teacher. He has stated the facts as he knows them, enlarging upon none of the remarkable details of this teacher's work.

Is it possible to imagine a course of discipline more hopeless or grotesquely absurd? Should not common sense, in the first place, warn every teacher against the employment of a work so utterly unpractical as Spohr's "School"? If we are to judge Spohr's knowledge of the needs of a beginner by the "School" which bears his name, we must unhesitatingly decide that he was absolutely unfamiliar with such needs. His so-called school begins at the very beginning of the rudiments of violin playing, and after a few brief lessons leaps to technical problems which only the advanced player can solve. Indeed, many of the exercises given in this famous "school" require highly developed technic and not a few make serious demands on the mature and thoughtful artist. How, then, can such a work be helpful to the beginner? Seriously to attempt to study it is entirely out of the question. Though the pupil's gifts may be exceptional, the order of his progress must be healthy and rational; and it is a physical impossibility for him to play such a "school" and Spohr's fifteen concertos without having previously undergone the most thorough and progressive training.

Happily there are few teachers to-day who map out for their pupils such a remarkable course of instruction as did this devoted pupil of Spohr. But the majority of our teachers little appreciate the imperative need of bringing common sense to bear on all the interesting details of their educational work. When, for instance, a pupil's intonation is faulty or even seriously inaccurate, the teacher is too easily led to the conclusion that such inability to play "in good tune" is undoubted evidence of defective hearing. Such decision is oftentimes hasty and unwarranted. Imperfect intonation may be the result of various conditions which, either temporarily or for some protracted time, not only influence the ear but rob it of its natural accuracy and sensitiveness. Sarasate can hardly be accused of being unmusical, nor can it truthfully be said that his ear is ill-trained; yet, on several occasions, the writer has heard this brilliant violinist play decidedly "sharp" during the entire performance of a concerto. And, what is more especially interesting in connection with the question of correct hearing, Sarasate rarely pitches a tone too low, but if, at the beginning of a concerto, he evidences a tendency to play too high, it follows almost invariably that he maintains a sharpened pitch throughout the entire performance.

Irregularities in intonation, tones that are played either too high or too low, may, in the gifted violinist, be safely regarded as evidencing a temporary physical or mental condition which influences the fingers more than it does the ear. In the work of many of our students imperfect intonation is the result of careless, uncritical study, too often pointing an accusing finger to the reprehensible neglect of scale work.

Time and again we see teachers and pupils struggling to remove difficulties without having first ascertained the cause of the same. Common sense and a moment's reflection are sometimes all that is required to remove seemingly stubborn obstacles. The faulty attitude assumed by some players is frequently one of these "stubborn obstacles." Many pages have been written on "how to hold the violin," and learned writers, like Courvoisier, have treated the subject with some scientific precision. But our young violinists (and many older ones, too), still continue to misapprehend all these wise injunctions, and technical difficulties and embarrassments, which are the direct result of a faulty attitude, remain unremoved simply because their origin is not understood.

If the left hand is raised neither to the right nor to the left of the shoulder, but somewhat higher than the shoulder, the result will be an attitude that is absolutely normal for violin playing. Unfortunately, the very simplicity of this method of learning how to hold the violin, does not often appeal to teachers who seem to delight in burdening themselves and their pupils with wholly unnecessary complications. Unfortunately, too, the attitude which the pupil learns to assume, after many laborious experiments and great waste of energy and time, is often the cause of faulty technic and an ill-trained right arm.

Through negligence or miapprehension, or both, many players acquire the habit of holding the violin far to the left of the shoulder, thus greatly increasing the difficulty of drawing the bow in a parallel line with the bridge. The attempt, under such conditions to draw the bow correctly, forces the right arm forward into an unnatural position and consequently increases all the peculiar difficulties of right-arm technic. To draw the bow its entire length immediately becomes a serious problem, if not an impossibility. Common sense, that wonderful rectifier of blunders and evils, continues dormant; and teacher and pupil struggle hopelessly with questions of right-arm technic, instead of directing their attention to the abnormal position of the left arm.

But aside from questions purely technical, the teacher's work would prove more helpful, the pupil's task less arduous, if common sense prevailed. In the training of a violinist, a thousand and one questions of an untechnical nature demand thoughtful and practical consideration. The teacher who makes no effort to understand the temperament and individuality of his pupil, cannot hope to be a successful teacher in the truer sense of the term. The following anecdote will serve more fully to illustrate my meaning:

Mr. X—, a superb violinist, studied for a brief time with Joachim. The celebrated artist thought, one day, that he detected in Mr. X— a strong dislike for Spohr's music, and cynically asked him whether he preferred "rubbish" of the French school of violin playing. Pained and embarrassed, Mr. X— replied that he was fond of only good music, that he respected Spohr, but was not always in sympathy with him. This honest expression excited Joachim's strongest displeasure, with the result that Mr. X— was permitted to play Spohr and Spohr only, for the balance of the term!

Action in some field is the final stage of development; and to stop short of action, to rest in emotion or thought, is to miss the higher fruits of living and to evade one's responsibility to himself as well as to society.

ORCHESTRAL PLAYERS.

It is strange that when so much attention is concentrated on orchestral music, so little should be known outside professional circles of the men who make it. The last couple of decades have witnessed the rise of the conductor into public prominence, and the *personnel* of the band has, to some small extent, profited by this new found prestige. But it is wonderful how little the average concert goer—we are not speaking of those who have studied at a conservatoire or played in an amateur orchestra—knows of the constitution of the orchestra or of the *timbres* of the different instruments outside of the leading strings—how few, in other words, could, if blindfolded, tell the tones of the oboe from those of the clarinet, or could distinguish between the soft notes of trumpets, horns and trombones. Analytical programs and the practice of printing the names of the members of the orchestra have, to a certain extent, remedied this imperfect knowledge; for the auditor—on being told, for example, that the subject is given out on the cor anglais—can by the simple process of referring to the list of players and the use of his eyes connect a certain quality of tone with a certain instrument and a certain player. Thus in the veriest amateur, if he or she be gifted with a good ear and a little curiosity, a personal interest may be developed which adds not a little to the pleasure of concert going. Berlioz in his Memoirs gives a most amusing account of his early visits to the opera, in which this personal interest manifested itself in the most acute form. As the performers filed into the orchestra, Berlioz used to name each of them to his fellow pittites, "introducing each player with a running commentary on his habits and powers." The commentary is as follows:

"There's Baillot. *He* does not reserve himself for the ballets like the other violins; *he* does not consider it a disgrace to play the accompaniments in an opera by Gluck; he will play a passage on the fourth string presently, and you will hear it through all the rest of the orchestra. That fat ruddy fellow yonder is the principal double bass, old Chénié. He is a hale old fellow, in spite of his age, a host in himself, and worth four of the others. You may be sure his part will be played as the author wrote it; he does not belong to the school of simplifiers. The conductor ought to keep an eye on Guillou, the principal flute player, who is just coming in; he takes the strangest liberties with Gluck. For the religious march in 'Alceste,' for example, the composer has written a low part for the flutes, so as to obtain the special effect of its deep tones. Guillou does not approve of this; he must take the lead, he *will* be heard. And so what does he do but play his part an octave higher, destroying the author's effect and turning an ingenious idea into one that is peurile and commonplace."

But even to a less sensitive observer than the author of the "Traité d'Instrumentation," the orchestral player is often a most interesting figure, whose artistic personality and style reveal themselves in so marked a way that certain familiar passages become inseparably associated with the tones of a particular player. Of course the size of a modern orchestra renders it impossible that extended recognition of this personal element should be habitually made by musical critics, and in the case of certain large groups of instruments the singling out of individual players would be an extremely difficult as well as invidious task. Hitherto, however, orchestral players have run no risk of suffering from an excess of notice. An *obligato* accompaniment is occasionally noted, but the performance of the many and elaborate solos for the wind instruments which occur in symphonic works is habitually passed over without a word of comment, though the omission is no doubt often made good by a sympathetic and appreciative conductor.

The denial of the sweets of popularity has probably not been without its wholesome effects on the character of the average orchestral player. Although living in the blaze of publicity, they enjoy a collective reputation and are in no danger of being spoilt by notice. With rare exceptions, they are entirely free from the affectation, the vanity, the jealousy, and the egotism so often observable in so o artists. For example, we know of two celebrated horn players who, though to a certain extent rivals, are the most intimate friends and loyal allies. Now, when did any one ever hear of two tenors being close allies? Even the affection of a Damon and a Pythisas would have failed to stand the stress of such a competition. Then it is remarkable to notice, even when an orchestral player has a solo passage, how careful he is to avoid undue self-assertion. No modern trombonist would emulate the

player who, at the first performance of the "Lobgesang," introduced a florid turn into the opening phrase. The tricks of the *virtuoso* are "taboo" in the orchestra, and the ironical custom at rehearsal of throwing a copper or two at a player who has had a showy passage all to himself, by its implied comparison of the performer with a street player, acts as an excellent corrective of vanity.

The modern orchestral player, again, seldom cultivates any eccentricity of custom or appearance. He dresses just like any other mortal, eschews long hair, and if he shows a special fondness for keeping his hat on at rehearsal, it must be remembered that the draughtiness of orchestras and places where they play is proverbial.

With regard to musicianship, the standard of the English orchestral players is in most respects very high. They are notorious for their sight reading, and many stories are told in illustration of their exploits *a prima vista*. Thus it is said that when M. Paderewski, after composing a piece for pianoforte and orchestra, was anxious to hear how it sounded. He hired a first rate orchestra in Paris, but after two hours the players had not got beyond the first movement; later on, when the work was put in rehearsal for the Norwich Festival, a London band played it straight through. Again, Dr. Richter is reported to have been much struck by the way in which a well known English clarinet player read off at sight an elaborate cadenza in one of Liszt's Rhapsodies.

Though laudably exempt from the most aggravating eccentricities associated with the artistic temperament, the men of the orchestra are not free from their little weaknesses. They are disposed to show perhaps an undue preference for works which are brilliantly and effectively orchestrated, or which give special opportunities of distinction to their own particular instrument. The uncompromising composer who sacrifices beauty of tone to dramatic intensity of expression is sometimes ranked by them below the utterer of smooth or sonorous platitudes. They are resentful, on occasion of the unconventional and unfamiliar. Witness the historic occasion when the Philharmonic orchestra, to Mendelssohn's indignation, burst out laughing at the reiterated triplets in the Finale of Schubert's C major Symphony. And, in the case of English players, they are no doubt slightly hampered by the solid and unemotional qualities of the race where the interpretation of romantic music is concerned. What Wagner said of the English players in 1855 is still in a measure true of their descendants: "Ils jouent parfaitement, mais il leur manque le feu sacré." Precision, volume and purity of tone—in these respects they are not lacking; but in passion, *abandon*, and caprice they are less sensitive to the indications of a conductor than their foreign brethren.

Yet in conclusion it must be set down to their credit that though sometimes unsympathetic to a stranger or young composer unversed in the *technique* of conducting, they always recognize and respect a master of the craft, and will submit cheerfully to a severe taskmaster if his authority rests on real knowledge and is tempered by the exhibition of immediate appreciativeness.

It may be that our orchestras contain fewer men of such outstanding individuality as the giants of the past, "Old Drag" (the famous double bass player Dragonetti) and Lindley, Sainton and Lazarus, Crozier and Pratten. There has been no doubt a leveling up in regard of efficiency, and this uniformity has not been attained without a certain loss of character. Besides, where the average player is so much younger than formerly, he has hardly had time to develop any great peculiarities, amiable or otherwise.

But we must not conclude these somewhat discursive remarks on the men of the orchestra without admitting that, though perhaps less interesting specimens of humanity than formerly from the point of view, say, of the novelist or journalist, they are on other grounds far less open to criticism.—*The Spectator.*

In small proportion we just beauties see,
And in short measures life may perfect be.
—*Ben Jonson.*

The man whose artistic instinct is deep cannot be content with those visions which arise out of the deeps of the imagination and wait for that expression which shall give their objective reality; the vision brings with it a moral necessity which cannot be evaded without serious loss. Indeed, the vitality of the imagination depends largely upon the fidelity with which its images are first realized in thought and then embodied by the hand.

THE OLDEST VIOLINIST.

The London *Musical Times* thinks August Wilhelmj, Sr., who, at the age of ninety, still plays on his instrument every day, is the oldest living violinist. He is, however, a mere amateur, whereas his son, August, lived up to the prediction of Liszt, who, when he introduced him as a lad to Ferdinand David, said: "I bring you the future second Paganini." This Wilhelmj is at present teaching his instrument to advanced pupils in London, and he has been at work for some time on a new method for teaching the violin. At the same time he has not given up his career as virtuoso, and recently he remarked: "I hope to concertize again, and perhaps take another tour in America." Wagner's favorite violinist would be sure of a cordial welcome on this side of the ocean, where neither Sarasate nor Ysaye has succeeded in effacing the memory of his luscious tone and eloquent phrasing.

August Wilhelmj was thirty-one years old when Richard Wagner invited him to be concertmaster of his Bayreuth orchestra in 1876. Wagner knew him to be a great interpreter of Bach, and when he first heard him play the famous Chaconne he embraced him with tears in his eyes and said: "My dear Wilhelmj, I can scarcely speak, but you must feel the deep impression you have made upon me. It is the most perfect artistic interpretation I have ever heard." It was Wilhelmj who persuaded Wagner to undertake the festival concerts given at the Royal Albert Hall in London in 1877. "It is your promise to place yourself at the head of the orchestra which I shall conduct, that has made me take kindly to the thought," Wagner wrote to his friend. The orchestra consisted of 170 performers, and it was in connection with these concerts that Hans Richter was first introduced to London, where he has since done so much to popularize modern music. The members of the orchestra were so much pleased with their concertmaster on this occasion that they presented him with a costly violin-bow as a mark of their esteem.

It is to be hoped that Wilhelmj will find time to write his reminiscences of Wagner, Liszt and other great men with whom he was intimate. There will, of course, be plenty of amusing incidents to record, too. For instance, when he gave a concert at Denver, he put the Bach Chaconne on the program as first announced, but afterwards substituted the Mendelssohn concerto, because his manager feared that Bach might prove too difficult for a Colorado audience. After the concert a man came to him who said that he had come a hundred miles to hear him play that Chaconne. Fancying he had a Bach enthusiast before him, Wilhelmj invited him to his room and played the Chaconne for him. Imagine his feelings when, after one of the violinist's best efforts, the supposed lover of Bach calmly remarked: "I don't think much of that piece!"

RESTRAINT IN PIANO PLAYING.

E. A. BAUGHAN.

In general our pianists do not understand the genius of their instrument. Wonderful as the modern pianoforte is it has decided limitations in respect of power of tone. Treat the piano with diplomacy and it will sing sonorously and with infinite variety of tonal gradations. Force it, assault it, domineer over it, and it shrieks, and there is no expressive *timbre* left in its voice. The piano is very feminine; you can make it do much by humoring it. Hardly anything you may ask of it will be refused if only you do ask and not command. This modern rhetorical display of force possibly has its origin in public recitals, for if there is one thing an amateur cannot achieve, it is to play clearly and forcibly and rapidly. Therefore, the professional pianist likes to show the amateur that he can easily attain to the impossible. Why we solemnly listen to the ugly, hard tone produced by so many pianists I do not know. We would not stand it for a moment in an orchestra. For one thing, it is impossible there, because each instrument has its limit of force. The wood-wind and brass can easily be overblown, and the result would be unbearable. It is really the same with the piano, except that being a fixed tone instrument there is no actual limit of overblowing (if I may use the phrase of piano playing). Short of breaking the hammer or sending the instrument out of tune (as so many of our powerful pianists do half-way through their recitals), a key struck with unimaginable force will still give you its note. But none the less it is easy to cut through the tone of the most powerful piano ever manufactured. The limit of force in piano playing should be beauty of tone, and the pianist should experimentalize until he ascertains exactly the greatest amount of force he can use without losing beauty of tone. That force should then be the measure of his climax, and the gamut of dynamic expression should be founded on that possible climax. I know only one pianist who understands this—Ferruccio Busoni. I say nothing of him as an interpreter, but he has gauged the powers of his instrument, and obtains the effect of immense climax by working from that powerful but beautiful *fortissimo* down to a murmuring and yet clear *pianissimo*. One hears the same thing in Ysaye's conducting of the orchestra. He will have no force that is divorced from beauty of tone, and the result is the band under his direction never rants or shrieks beyond its power of expression; consequently, he gives one the impression that there is a reserve climax if necessary. Partly this is due to a fine sense of the details of musical design, but mainly, I think, it arises from beauty of tone in the strings, wood-wind and brass alike being made a *sine qua non*.

This kind of restraint is the secret of all great musical performances. It does not mean that there is a coldness of emotion. That is quite a different kind of restraint, and is admired by no one but the perfect prig. With the great singers you will find this restraint is half the battle. The expressiveness of a Ternina or a Jean de Reszke would not be possible if they forced their tone so that all natural inflections of voice were lost. In singing, breathing takes the place of bowing in violin playing. Watch an Ysaye's command over his bow; or listen to the phrasing of a Patti or a Ternina, and you will grasp the fact that each of these artists has complete nervous and mental control of force. This control gives freedom and naturalness, and makes the voice and the instrument a plastic medium for the expression of emotion.—*Monthly Musical Record* (*London*).

Nor rural sights alone, but rural sounds
Exhilarate the spirit, and restore
The tone of languid nature. Mighty winds,
That sweep the skirt of some far-spreading wood
Of ancient growth, make music not unlike
The dash of Ocean on his winding shore,
And lull the spirit while they fill the mind.
—*Cowper.*

SUMMER READING.

W. F. GATES.

Now comes the time of year when we see lists of "light Summer reading" quoted for the benefit of those who can avail themselves of the vacation season. It is a kind of popular fallacy that the reading one does in the Summertime has to be of light weight and border on the trashy. There might be some little truth in this for a person whose work during the year is confined to heavy literature; but such a person would be the last to avail himself of a list of "Summer reading." The course of Summer reading is about as necessary as a course of Spring medicine. The medicine is a good thing to sell; so is the reading.

When one is working hard it is well to relax the mind with occasional light reading. But think of three months of it! The light literature breeds the habit of careless reading and skipping over page and paragraph in a way that is suicidal to habits of careful study.

The hardest point in getting a young person into good reading is at the start. A life of Beethoven or Mozart may look dry and uninteresting beside the popular novel; but once started into, it becomes interesting, if good choice has been made of the author. A Summer of light reading may break up a partially formed taste for that which is good. Why not recommend, then, to start with, a book like "Anecdotes of Great Musicians," then Crowest's "Beethoven," Lidgey's "Wagner," Haweis' "Musical Memories" and "Music and Morals," Elson's "Reminiscences" and "Great Composers" and numerous other attractive books? Get something out of the Summer reading. There is a pleasure in reading facts as well as in fancies; as much pleasure in reading about real people as in imaginary ones.

There is one sweet instrument of music that does not change; that is the same to-day as of old. The voice in song is as sweet to-day as ever it was, even though the accompaniment be different. The singer whose power was sufficient to rend the rocks of old and to tame the raging lion is with us still, and ever will be.

THE VOICE

MR. FRANK HERBERT TUBBS, Associate Editor.

With this issue we continue the series of answers to inquiries. We have been running articles of a pedagogic nature from which material for study has been derived. Now we purpose giving a very practical trend to this department by answering questions sent us by teachers and students. This instalment shows the helpful character of this department. We will welcome inquiries from all who desire help.—Editor of THE MUSICIAN.

INQUIRER'S DEPARTMENT.

FRANK H. TUBBS.

Please name some sets of vocalises in order of use. Also some theoretical works.

The question does not say whether the vocalizes are for high or low voice. As many teachers may need suggestions about such business implements it is well to go into the whole matter. The advantage of using vocalizes is (1) In the facility in reading they permit; (2) In application of rendition, particularly with reference to phrasing and "style"; (3) In the means of using the voice. Vocalises have their place between plain voice culture and song singing. They should not be ignored. Some teachers think they can write exercises for students' use which are sufficient for preparation for song singing, but unless they are very good composers and write extensive exercises their pupils will do very moderate song singing. It is wise and it may be a necessity to study several books of exercises. Those which are recommended below have been prepared for a definite purpose and have been carefully edited.

For sopranos and tenors an excellent first book is Concone's Fifty Lessons (Op. 9). It is published by many firms in this country and Europe. Follow that with Concone's Fifteen Lessons. These are really quite difficult. If students need something harder use Righini's Exercises.

Another set for the same voices would be Panofka's Exercises, Op. 85. (Published by the Hatch Music Company, in two parts.) Then Panofka's Op. 81. These are harder.

A capital book of graded studies and exercises is "Vocalizzi Preparatorie," by Lamperti.

For alto, baritone and bass use Concone's Forty Exercises, Op. 17. These can be followed by Panofka's Op. 86. It is well to use some of the arias of the Italian operas of the Rossini and Donizetti schools as advanced vocalizes.

That little book, by Vaccai, must not be forgotten. It is not so much a book of vocalizes as a set of exercises for teaching the use of embellishments which are commonly introduced by composers. One secures facility in adding, with good taste, little graces to music which is incomplete. Unfortunately, composers do not finish their songs as well as they might and artists must add what improves the music.

Regarding theoretical work on the voice, it must be said that there are very few worth anything. The science is in such a developing stage that what was within twenty years ago isn't worth much now. But if a teacher will use theories as suggestive and not authoritative he will get much good from the books. Then again most books on the voice are written for exploiting the notions of teachers and of adding to their reputation so they may gain business. Of course, such works must be taken guardedly. They may hold important truths but are quite likely to be worthless. Here are titles which the writer holds in high esteem, and that remark does not imply that books not mentioned here are not worthy esteem.

Behnke's "Mechanism of the Human Voice."
Brown and Behnke's "Voice, Song and Speech."
Kofler's "Art of Breathing."
Seiler's "The Singing Voice."
Roger's "Philosophy of Singing."
Bach's "Principles of Singing."
Howard's "Artistic Singing."

In making a library get one or two books at a time and digest those before getting more. There are less than one hundred books which the vocal teacher will care for.

My teacher says that deep breathing will make a large waist. Is that so?

Not if correct breathing is used. The term, "deep breathing," has been misunderstood and wrongly applied. People who are ignorant of anatomy think that deep breathing means to breathe so that the abdomen is very greatly exercised. They have been told that the diaphragm is the muscle with which to breathe and they think that organ is somewhere in the middle of the abdomen. They then try to exercise it. Of course, the effort they make causes excessive enlargement of the waist, and the more persistent they are the worse it is for them. They and their students become badly shaped and it does not help culture of the voice at all. The error arises in ignorance of the location of the proper breathing organs. The chief organ *is* the diaphragm, and, although it is repetition of former instruction and something which all our readers should know by this time, that organ is above the abdomen. In front it attaches to the breast-bone. Now, not one lady student in a dozen will find, even if she tries, where the end of the breast-bone is. Nearly all, when asked to point it out, place the fingers from one to three inches too low. The ribs go to right and left from the breast-bone and those which go out at the lower part run downward almost parallel for two or three inches and then turn right and left. To find with the finger where the end of the breast-bone is, one must follow the grove upward till it ends. At that point the muscle called the diaphragm is, and that is the point of deep breathing in front; not in the abdomen four or five inches lower. Then, another wrong idea is prevalent about the sides. Most people think the diaphragm runs along the edge of the lowest rib and to them deep breathing means spreading out the lowest rib. It is wrong. In the sides the diaphragm passes an inch and a half to three inches higher than the low (floating) rib and it is at that level that deep breathing should be carried on. No teacher will say that deep breathing done at its proper place will make a large waist. On the contrary, the tendency is to enlarge and make full the chest and bust. Then by contrast the waist seems smaller. Correct breathing does much to give good figure with outlines of grace and beauty, and when anyone, who advocates deep breathing and has enlarged waist, it is certain that she is doing her work wrong.

In singing, so far as breathing is concerned, the important thing is to conserve the breath; to hold it in such way that it is delivered economically to voice producing organs. Deep breathing of the abdominal kind defeats such delivery. The muscles of control are (aside from the diaphragm) those which are in the sides and chest, at and above the diaphragm. Please read over again the location of the diaphragm. Then, remember, that it is a flat muscle, like a platform, extending through the whole body, forming a partition between the chest and the lower part of the body.

●

Can you suggest something to help in training men's voices?

Lady teachers often fancy that the male voice must be something hard to train. They know all about sopranos and altos, but the men pupils! Let them be reassured. So far as training them is concerned they are to have the same treatment as do those of women. The pitch of the voice is one octave lower. That is all. Tenors correspond with sopranos, baritones and basses with contraltos. The male voice is more rugged and can be treated quite roughly. There are fewer complications of registers and qualities with men and the male voice is more easily trained. Lady teachers need not fear to receive pupils of either sex so far as difficulty in voice culture goes. It would be a grand thing for music if lady teachers could induce a dozen men to get into training. Men are needed in all branches of musical interest, and it sometimes seems as if business cares, more absorbing than ever before, were preventing men from studying more than ever. Get men interested in music and there would be more ladies interested.

●

"What is a good way to train the voice and get the most improvement?"

The complete letter from which the above is quoted is well worth giving, for it shows that young people are calling for better teaching, and for intelligent, rather than indefinite, method. Here it is: "There is a contraction of the throat when I am singing, especially on notes above middle B or C. Should this be? Should there be any tightening of the throat or under the mouth when singing? If not, please give me a remedy, if you know of any. Am nearly nineteen. Sang in a choir for a few years as a soprano when voice changed; rested for two years and then commenced training, which has been going on for nearly two years, but don't seem to make much progress. What is a good way to train the voice and get the most improvement, and how should the exercising be done, quietly or pretty loudly? I don't seem to be able to get tone in front of my mouth, unless I sing loud. Do you know of a way to keep the voice in good order, so that the throat doesn't become inflamed or hurt when swallowing?"

Many of our teachers and the students who have followed these pages through a term of years would say that all this ground has been gone over and ought not to be taken up again. But are all of us entirely free from throat troubles? If so, we are fortunate. But I think most singers, even the best, need some words about keeping off the throat. Some readers will say, "Why, to answer this young man would require a book!" I felt that way at first and wanted to say it would be too much to try to answer. Also, that ours is not a correspondence school in voice culture. After thinking it over my thought took this form: "THE MUSICIAN is the most helpful musical magazine in the world. If we can be a positive help in saving this young man from ruin and make him a musician, it is a duty. We will do it."

The whole trouble in this case comes from not knowing what normal action of the vocal organs means. Everything about the larynx, jaw and tongue is under great tension. Probably underlying that is forced respiration. With that is striving body. All this may be going on and the young man really believe he is not straining at all. If he were with me, for personal direction, probably his first bit of drill would be on carriage of the body, or making gestures with arms or head. The whole structure needs liberation and when it is liberated much which most teachers work upon in the way of local training can be dispensed with, because the parts respond to the training of the whole. Certainly, I would not begin by training the strain away from the throat. After the body had obtained a degree of pliability (and that would take about ten minutes), I would look after the breathing. For, if the breathing is very wrong, no amount of work at the throat, no matter how correctly directed, would do any good. Probably ten minutes more would set that student right about breathing. Then it would be the proper time to see what was being done with tongue, jaw and face. These are the organs which are causing all the trouble. They should be inspected in their action during conversation. The way they then act is the way they should act while singing. Select any words, which require action of the organs of speech and study, that action on the simplest way they can be used. It is well to whisper the words and see how the organs then act. As they act in whispering they should act in singing. Most pupils, when they begin tone with words begin strain also. If the organs of speech take different positions when tone is used with words, from what they do during whispering, there is strain, even if it is not felt. Lamperti used to have his pupils study action before a mirror, thus using sight as well as feeling. "If any different action would be seen go over the attempt until the action is the same," was his instruction. If strain goes on the throat there will be some little evidence of it under the chin. There should be no action under there when singing any words.

In attempts to get breath control many pupils call throat strain into existence. When a pupil does this I tell him to breathe air directly upon the larynx. Or,

I say, "Breathe out freely and pour tone into that escaping breath." After a few attempts the tone emission becomes free.

Regarding singing loud to get tone in the front of the mouth, there is but one thing to say: The tone gotten there by loud singing is bad tone and is badly placed. That attempt—to place tone by loud singing—must lead to throat-strain and it must be abandoned. It is far better to sing in whispers than to sing loud for that purpose.

In conclusion, this young singer would do well to stop practice till he can have some lessons of a skilful teacher. His voice is evidently a valuable one and he loves music. Continuance of bad practice will eventually lead him to abandon music in disgust. He is too good to be lost. What must be done in his case, and what ought to be done with the majority, is to build up from the beginning a correct method of training the voice. That should be done with a teacher. In place of that, let any who feel themselves to be placed as he is, use all the suggestions we give in these columns in the greatest and most mild-measured way they can. While this may not give them their highest attainment it will allow them to use their voices well, and they will do no harm. They will improve, even if they do not become expert.

●

Ought one to try to sing very loud in a large hall?

The great contralto, Annie Carey, once sang in the studio of a prominent vocal teacher in a way which led the teacher to ask: "Are you using your full voice? Are you singing as loud as you do in the theatre?" She replied, "Yes, I sing no louder then than I do in this room." That may well be the answer to the question. The laws of acoustics are little understood. How tone is conveyed is not known. But this is known: If one tries to sing very loudly he forces the production of tone (so it is imperfectly made), and an imperfect tone, though loud, will not travel so well as will a perfect tone, though small. As one gains experience in public singing he learns to adapt his power of voice to the size of hall and sings as easily in a large hall as he does in a small room. He certainly should not try to sing louder in one place than in another.

●

Should one seek the sensation of holding the breath by the back muscles? If so, how can I do it?

The best breath-control muscles *are* in the back, but one should not seek a sensation there when singing. The best singing comes after all sensation ends. In training for breath control, which is a physical act, one should seek to obtain action in the back and when he has got action he should become able to use that action without sensation. So long as sensation is felt there is sure to be more or less tension. Training for action will take two forms: First, to get the muscles pliable and so they can draw in breath; second, to hold still so as to retain breath. For the first, place the hands behind, on the small of the back and inhale to the hands, strongly, broadly and completely. This should be done every day for a week, or even two weeks. After that it should be done occasionally to keep the muscles supple. For holding the breath by the back muscles, reach the hands forward as if in supplication and hold the breath, feeling that the back is well rounded. Stand in this position, holding the breath all the while, for ten to twenty seconds. These are acts of physical culture and should be used without singing. They will bring right action into the back and holding muscles, so that when you do sing the breath control will be good. When you sing, draw breath in any way which is easy. Then, avoid any sensation of holding. One who has become accustomed to sensation of holding will feel that he is losing his breath control at first. But that is fear and it will pass away.

To "N. D." Omaha. Your question requires a personal answer. The answer would not interest the majority of our readers. If you will send to this office your name and address, the editor of this department will write you personally. In this connection, he extends an invitation to all subscribers to write him on matters which have personal interest (so that he may reply in a personal letter), and let the questions to this department be those which touch on principles of singing. We must keep the department general so as to interest all our readers.

Kindness is the music of good-will to men and on this harp the smallest fingers may play heaven's sweetest tunes on earth.

TSCHAIKOWSKY AS A SONG WRITER.

ERNEST NEWMAN.

Most of us have become so accustomed to look upon Tschaikowsky as merely an instrumental writer, that it is with surprise we learn how prolific he was in the vocal forms of music. But we really ought to know his songs better than we do. If they only appear in our vocalists' programs once in a hundred times, we may cherish our own secret opinion of these ladies and gentlemen, but we cannot excuse our own neglect of the songs. There are about a hundred of them—a field large enough for anyone to take his choice in; they are cheap in the foreign editions, and anyone can get an excellent idea of them at his own piano and with his own voice. There is really no reason why the general amateur should not know them better. Even if he does not understand Russian or German, there are several excellent collections published in English; and if these only contain, for the most part, the earlier songs, still there is quite enough of his best work among them to afford an idea of his style and range. Going even on the basis of these, more justice might have been done to Tschaikowsky. The neglect of the amateur and the second-rate critic is not so astonishing, perhaps, when we find a first-rate critic like Mr. Huneker, in his "Mezzotints in Modern Music," polishing off Tschaïkowsky's songs in half a dozen lines. "Some are redolent of the sentimentality of the salon," he says, "but there are a few that are masterpieces in miniature"; and in support of this judgment he names the well-known "Warum sind denn die Rosen so blass?" and the "Nur wer die Sehnsucht kennt." Of the latter he remarks, "In intensity of feeling and in the repressed tragic note this song has few peers." Well, even in the limited English editions there are several songs which, in spite of the frequently bad translations, move one quite as much as either of those named by Mr. Huneker; and there are many not published in English that throw additional light on Tschaïkowsky's powers as a song writer, and help us to judge his place among the half-dozen great lyrists of the world.

Here and there a song, if only hastily examined, seems to suggest merely what Mr. Huneker calls the sentimentality of the salon; and let me frankly admit at the outset that two or three of the songs are bad—hopelessly, unspeakably commonplace. But the same admission has to be made in the case of every great lyrist—nothing, for example, being so utterly depressing as Brahms at his worst. I venture to say, however, that in certain of Tschaïkowsky's songs the sentimentality is only apparent, and that the fault lies not so much in the song as in us, who have not been able at once to bathe ourselves in the correct atmosphere. In other songs, which, though not really poor, have a tinge of the commonplace about them, an honest examination cannot fail to discover *some* mark of power, some touch of magic that, paradoxical as it may seem, differentiate the work from that of a much smaller man who might have written it much better on the whole. Take as an example the "O geh' nicht von mir, mein Freund" (Op. 27, No. 3). This, at first sight, appears to be merely a drawing-room ballad, melody, rhyme, harmony, and accompaniment being just one degree above the commonplace. But the thing is saved from being absolutely ordinary by that indefinable something which we can only call "atmosphere"—the right suggestion in the music of the general mood of the poem. At the words "O geh' nicht von mir, mein Freund, Liebster bleib' ewig bei mir," for instance, so just and veracious is the emotional color that though we could not say the song was anywhere great, we are conscious it is made by a master of the craft, who can do quite simply and unconsciously what smaller men would have to rack their brains to achieve.

In only one department does Tschaïkowsky fail at what he attempts. With the exception of the sardonic "Don Juan's Serenade," he has no humor in his songs—of which statement let the dreadful "Czar's Drinking-House" stand as a proof. Here and there in the "15 Kinderlieder" there is a pretty suggestion of the child's view of things, but hardly any humor, even of the kind comparatively easy to get in music of this order, so obviously humorous a subject as the cuckoo becoming quite uninteresting in Tschaïkowsky's hands. Nor is there much gaiety and freshness in his songs. Indeed, I think only one can be named that really expresses the joy of life and nature—the exquisite duet "Morgenroth," in which the sensation and the outlook are truly those of the morning. For Tschaïkowsky's general mood, it must be confessed, is the reverse of sunny. He is always oppressed with a sense of the seriousness of life. He loses no opportunity of reading the darkest meanings into the most inoffensive subjects. Not content with making the most of the sombre suggestions given him by his poets, he must go out of his way to sound a deeper note of tragedy than his subject quite demands. In the piquant and graceful "Canary Bird," for example, after the sultana's request for tidings of the Western lands, few people are prepared for that wild outburst of grief and passion in the bird's reply, so completely out of scale with the rest of the song, so obviously out of keeping with the character of the tiny songster, yet so intensely moving in itself. It is stricken humanity that finds a voice here, not the canary in the sultana's cage. Tschaïkowsky forgot the tiny being whose grief he was describing, and thought only of opening the floodgates of grief in general—human grief.

Quite oppressive at times, indeed, is the atmosphere of Tschaïkowsky's songs: and to play through twenty or thirty of them at a time is sufficient to make the whole world look grey or black for a long time after. Yet in pointing out melancholy and despair as the dominant note of his songs I would not be understood to imply that each is a mere repetition, in other phrases and to other words, of the one unvarying message. There are more shades of melancholy than one, more paths than one to despair; and for each of these Tschaïkowsky finds a new scheme of expression. We may best compare him, in this respect, to his compatriot Tourgenieff. The bulk of the great novelist's work is a study of the weakness of human will, the Hamlet-like failure of the spirit to play its proper part in the active world of things. Yet in no two works of Tourgenieff do we have a mere repetition of characters or circumstances. Each example of defect of volition is a separate study, with its own centre and environment, its own causes and results. Lack of will, in fact, is only a broad name for a thousand subtle strands of tragic incompleteness crossing the lives of men; and the great artist will study each in itself, noting the fine shades of individuality that mark it out from all its fellows. Similarly, there is in Tschaïkowsky's songs a separate, distinct incarnation of as many shades of melancholy as there are men and events. And so, though a long continnous course of the songs leaves us somewhat debilitated, the artistic interest is always kept alive by the fine workmanship and the discriminating psychology. I would specify as examples of this delicate barometric variation of the music with the atmosphere of the poem the "Nur wer die Sehnsucht kennt," "A Heavy Tear," the "Invocation to Sleep," the "Neugriechisches Lied," the "O sieh' die Wolke dort," the "Er liebte mich so sehr," and the "Sleepless Nights." Although weary melancholy and despair are the themes of all these songs, how exquisitely graduated is the music to the precise tint and occasion of each poem! In the "O sieh' die Wolke dort" the pathos is pure, simple, heartfelt; in the "Invocation to Sleep" and the "Sleepless Nights," two distinct worlds of pain and weariness and unrest are opened out to us. The self-surrender of the musician to the poet is complete in everything that regards the psychology of their work. No more individual writing, no more gem-like creations of perfect form and perfect spirit can be found anywhere in the history of song than in the best lyrics of Tschaïkowsky.

As regards his style we naturally find him following the general manner of his other work. It is a notable fact that the habit of varied repetition which is sometimes a defect in his orchestral work is one of the cardinal virtues of his songs. His first aim is to get the general mood of the poem, and to fix this in some expressive phrase. The song is then resolved into a series of subtle re-statements of this phrase, so that the central psychological impression always keeps accumulating in power, while at the same time the imagination is kept interested by the perpetual play of new light upon the theme. One of his earliest songs, "Warum sind denn die Rosen so blass?" (Op. 6), and one of his latest, "Weil' ich wie einstmals allein" (Op. 73), may serve to show how thoroughly personal this style was to him, how spontaneously he could work in it. In some of his greatest songs this cumulative effect becomes quite shattering. We have the sensation of some terrible truth being driven home to us, of a long, insistent demonstration in the logic of the emotions, leading up to an unassailable conclusion. Nowhere else, I think, do we get quite the impression given us by Tschaïkowsky's great songs—an impression coming almost entirely from this

complete subjugation of the whole musical structure to a central poetic idea. I will not go so far as to say that Tschaïkowsky's songs are the finest portion of his work; but I think it can be said that as a general song-writer he has no superior, and that he has the individuality of style which only belongs to the really big men.—*The Monthly Musical Record (London).*

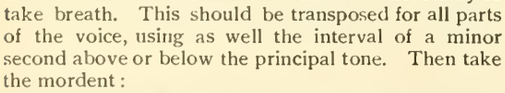
A PLEA FOR THE TRILL.

DR. HENRY W. GILES.

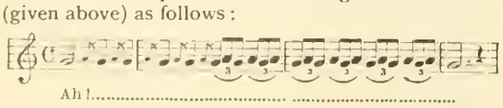
The trill as an ornament in singing has fallen into disuse. There are several reasons for this. The principal one is that it is regarded as the exclusive prerogative of the finished artist, that it requires a long and tedious course of preparation, and that even then only the especially talented may hope to acquire it. I propose to show that this idea of the difficulty of the trill is only apparent, and that it arises from the habit of attacking it in the wrong direction. To attempt to learn to trill by trilling certainly is not easy, but the exercises that lead to the trill should form a part of the scheme of study of every vocal student, whether the end and aim is the trill or no. In this way the vocal bands are gradually and almost insensibly trained to that flexibility and rapidity of action, which is essential to the production of the trill, but is also essential for the proper enunciating of the single and sustained tone as well. The first and simplest exercise is what Shakespeare calls, in his work on singing, "starts on ah." This is the ordinary staccato ah, and should be made with the soft attack, *i. e.*, with the vocal bands loose, and not drawn together, as in the stroke of the glottis. Sometimes there is difficulty in making this at first with the soft attack; in such cases the student should practice a few *hah's* where there is an escape of breath in the production of the h before tone begins. Afterwards return to the first exercise and notice that the vocal bands do not separate explosively, but gently and with little pressure of breath. Be careful also that there is a distinct interval in which the breath is held, between any two tones, and that they do not run together, as in ah ah ah ah ah. After a certain amount of proficiency is attained with the vowel ah, other vowel sounds may be used, notably short i as in "it," I have found very effective. Always use at first an easy pitch around the middle of the voice. From G to B is available for most all voices.

To excute the above neatly and clearly, even at a slow tempo, is difficult for a beginner. To attempt to develop a trill from it is hazardous, to say the least. But look at this.

Here the voice is poised, as it were on the G, and prepared for the quick and explosive attack of the A, which reverts immediately to the G as a place of rest. The tone must be continuous until it is necessary to take breath. This should be transposed for all parts of the voice, using as well the interval of a minor second above or below the principal tone. Then take the mordent:



In beginning the practice of the actual trill the tendency is to slight the adjacent or secondary tone. To avoid this use a rhythm of triplets which transfers the accent alternately from the one to the other. Preface it with the practice of the long and short tone (given above) as follows:



At first make a slight accent at the initial tone of each triplet—afterwards simply think the accent without actually making it.

If these exercises are faithfully followed the trill will cease to be the bugbear that many regard it, and its accessibility to the many, as well as the few, will be proven. To pianists I will say that they may apply the same principles in educating the fingers to execute the trill upon their instrument.

BREATH CONTROL.

CHARLES B. STEVENS.

In former articles under this caption printed in *The Concert-Goer* I have taken my stand positively and unequivocally in favor of special direct and conscious control of the breath as a means to an end, namely, correct emission of tone. This statement need not convey the impression that I believe it necessary or even desirable that the student of singing should be conscious of an attempt to control the breath *during the act of singing* (my meaning has been so misconstrued) rather would I intend to assert my belief in the regular and systematic practice of exercises for a type of respiration characterized by noiseless and imperceptible inhalations and well-controlled exhalations, without which artistic singing is not possible. This method of breathing should become, through practice, part and parcel of the singer's equipment to such an extent that specific thought of conscious control would not intrude upon or in any way interfere with tone-thought or music-thought, so essential to artistic expression in singing.

Why should distinct breathing exercises given the pupil result in wrong effort? Providing the exercises are simple and few, carefully and regularly practiced, naught but good, the greatest good can result. Is it not possible to carry too far the idea of developing the breathing muscles through the medium of correct tone, to the neglect of direct training of the muscles independent of singing?

The theory that any attempt to bringing muscles under control of the will is inconsistent with artistic vocalization may be popular but is none the less fallacious and directly responsible for such vocal defects as tremulousness, non-resonance and absurd phrasing.

I am nôt an exponent of nor a believer in the physiological school of singing; far from it. I recognize fully the importance, *the fact* of mind direction in all things, and especially in singing. Perhaps more than in any purely intellectual study should psychological laws and principles be dominant, particularly where we use the word psychology in its fullest sense and give to it its most comprehensive meaning, which must include everything contained in the personality that is not physical; not mind alone, but will, emotion, soul, the very *ego*, by a study of whose processes, conditions or states the teacher of singing is given a clearer and more thorough knowledge of the principles which underlie true methods of instruction. We must not forget, however, that to obtain best results we must treat this subject of singing from both a psychological and physiological standpoint. Singing is a psychophysical act, which is sufficient authority for the highest development of the physical as well as the psychical nature. Therefore am I confident that the breathing muscles should first be brought under the domain of the will by judiciously selected exercises practiced independently of singing; which volitional control should be abandoned as soon as its object, harmony of muscular action, has been accomplished, when normal automatic action will follow.—*The Concert-Goer.*

THE EVOLUTION OF THE SINGING TEACHER.

MME VON KLENNER.

Our age is the age of specialization, and the best specialist is he that concentrates his mental faculties upon one single branch of his profession, working it out to his best ability. This is, therefore, the age of concentration.

The singing teacher followed in his gradual development exactly the same way and shows precisely the same phases of evolution. His beginning dates back to the village schoolmaster who taught school, played the organ, instructed the choir boys and led the chorus. He had to be a "Jack of all trades;" he knew something of everything and nothing perfectly.

But the world continued to progress. Music became a household pastime. Specialization began in the ranks of performers, and every instrument found its interpreter and teacher. The most wonderful of all instruments, the human voice, infinitely richer in modulation and expression than all the others, could not be overlooked; choral societies required soloists among their members, the stage needed good singers, ensemble and role singing soon became a profession, found teachers equipped to impart it, and took its long-vacant seat in the front ranks of science and art.

The teacher of singing who stands at the height of his profession is, indeed, the final product of a long, slow, struggling evolution, and the accumulated knowledge which makes him what he should be, can be obtained only by years of unrelenting, untiring, concentrated studies. Diversification in its broadest sense is the password of his preparatory period. A limited education never will do for the singing teacher, for what he professes to teach is the standard of all that is music. "Whatever the development of the art, whatever the boldest combinations of a composer or the most brilliant execution of a virtuoso, in the end they must always return to the standard set by vocal music," wrote Wagner.

It is clear that it is essential for a teacher of singing to possess all the advantages of a good general education. Many possess knowledge, but few the gift to impart it to others. The singing teacher has, moreover, too often, pupils whose educational standard is such as to need constant guidance and example. To make them understand the scope of their self-set task he must be a reader of character. Knowledge of the structure of the vocal organs, which he has to develop, is another requirement of his calling. His knowledge of languages, accent, enunciation, etc., must be above reproach.

The only proper way to achieve this is by mastering phonetics, the science of sound, of the functions of the vocal organs, that enables him to tell his pupils just what to do with the tongue, hard and soft palate, teeth and breath, so as to acquire perfect idiomatic diction.

As a musician, the singing teacher must be broad and thorough. He should be a master in sight-reading, and although accompaniment is not absolutely necessary—in fact, only good when roles and scores are being studied—still, he should be able to accompany his pupils, accentuating the melody and thereby assisting them greatly in keeping time and rhythm.

The history of music, composition, harmony and counterpoint are indispensable; the latter helping him to transpose readily when necessary. Last, not least, he should be a singer himself, and give his pupils vocal illustrations, which always appeal to the imitative talent so conspicuous in the young.

All these accomplishments are indispensable to a singing teacher thoroughly fitted for his vocation, and must be supported by a natural gift for imparting his knowledge to those he teaches. Such a teacher, and such a teacher only, will develop good singers, and this is all he can be expected to do. For genius cannot be instilled, and only where genius is wedded to talent can the ideal result, the artist, be obtained. An artist is *born*, and never made by the teacher.

PATTI'S EARLY TRAINING.

Adelina Patti, as a child, was a physical weakling. Her brother-in-law, Maurice Strakosch, took her in hand, and not only made of her a musical phenomenon, but "healthy, clear complexioned and steel-nerved." His rule was "keep the mind clear of unnecessary worry, the body clear of unnecessary food—live with great regularity and great moderation." The little girl had to go to bed at 8 and get up at 6. Her food consisted of plenty of milk, eggs, cheese and fruit, and a very little roast meat. She was not permitted to touch candies, tea, coffee, wine or beer. Water she drank freely "to wash the body clear of bad humors." Patti has followed these rules as far as possible; when singing she goes to bed at 2 and arises at 10 and, when not on the stage, retires at midnight and gets up at 8. She has no filled teeth, has perfect health, and refrains from worry, says an exchange. She sleeps invariably with windows wide open, Winter or Summer. Fresh, strong and youthful in feeling at fifty-eight years, she says to women that "complicated living breeds worry and worry is the main enemy of health and happiness.

Man is now learning that his own thought power is a force, the intensity and utility of which has been almost undreamed of. The intuitive comprehension of this truth is no longer limited to a Plato, Paul, or Emerson, but is grasped by many minds of the present day.—*Henry Wood (Mental Photography).*

Thought always seeks embodiment. The thought of the engineer materializes in the completed engine, and that of the architect in the finished building, that of the composer in his creation. Every conceivable force, phenomenon or expression, when traced back, has for its original basis, *Mind in operation;* and this activity is regular orderly, and to be relied upon.—*Henry Wood.*

SINGING.

FRANK MERRY.

It is not a little disturbing to note, in connection with the vocal art, with what a blind irregularity voices seem to have been doled out to mankind by perverse fate. It might even be said that voices, like riches, are given to those who least understand the use of them. Putting on one side the vocalists before the public who have fine organs which they cannot use for want of musical sensibility or having anything to express, we are continually coming across private and most unmusical persons who are quite unconscious of the possession of very fine voices; and happily, have no need or intention of coming before the public. And how galling it is to meet some stockbroker or railway director with the voice of an operatic tenor and the soul of a cheesemonger, while we, though we may possess the soul of an operatic tenor, find ourselves saddled with the organ of a suburban baritone!

The vexed question of voice production may be compared with the equally distracting subject of medicine. Professors of singing disagree, after the manner of doctors. Like doctors, they also prescribe opposite courses of treatment for the bringing about of the same end. Like doctors, they sometimes kill and sometimes cure; and yet, like doctors—we cannot do with out them. We scoff at medicine when we are well—but at the slightest touch of pain, we fly to the medical man. And when we want our voice trained, we place our precious organ in the keeping of some professor of the vocal art, and soon develop a deep faith in the man and his method, holding him up as the finest exponent of the greatest school in existence. Whether we are in good hands or not is, of course, largely a question of luck; the more eminent the professor the less likely is he to worry about spoiling a voice here and there—it is a kill or cure still.

We often hear talk in these degenerate days of the secrets of voice production—of the lost art of singing. These are very convenient phrases on the lips of advertising gentlemen with quack methods, and they are very amusingly uttered by more innocent teachers who have made some wonderful discovery—very well-known beforehand to everybody but themselves. These remarks, however, do not apply to the great Italian School, in reference to which the term "lost art" is more justly used. But in respect to the Italian School, what has been lost? Is it a great method or great voices? Has the art degenerated because a few vocal tricks have been forgotten, or because we have no longer artists of such genius, of such earnestness and capacity for work? In discussing the vocal art, we must never forget that the basis on which it rests is partly a physical one; and this physical basis is an important factor in any comparison between the vocal art of to-day and of fifty years ago. It is the open air life in the dry climate that goes to make the fine voice, but the voice does not make the singer unless with these physical advantages is joined the emotional temperament and the æsthetic impulse of the real artist. Italy, with her climate, scenery and traditions, must have been an ideal breeding ground for singers, and in the course of nature has produced her famous line of great artists. Genius, however, is not hereditary, and tends to exhaust the race from which it springs, and thus for future singers we may have to look elsewhere. Among English speaking races, the voices come from America (with Canada) or Australia, where the out-door life in dry air is common. Yet in neither America nor Australia is there the high culture or artistic impulse which produces the great artist.

Much of the change of method from the old school to the new may have been rendered necessary by the change of physique brought about by new conditions of life. Singers who spring from a robust race, brought up in the open air with deep chests and larynxes that nothing could tire, would naturally adopt a different production to modern civilized vocalists, whose parents lived in houses, and did not use their muscles to any great extent. The former vigorous type would adopt the open production suited to their nature, would use their lungs freely, because their vocal cords could stand it; but vocalists of the more effeminate type must study resonance, light, breathing many registers, and all the *finesse* of modern training. —*Music* (*London*).

There never was a day that did not bring its own opportunity for doing, that never could have been done before, and never can be again.

THE FIRST SINGING OF "THE HOLY CITY."

The "popular" song is not always the long-lived one, that which pleases the fickle public to-day being carelessly relegated to the realms of forgotten favorites so soon as some new and "catchy" combination is brought out, but occasionally some gem appears which seems to gain new life with each passing year. Of this order is "The Holy City," which has been sung throughout the length and breadth of this and every other land where song is of a civilized sort; yet to-day its popularity is on the increase rather than on the wane.

An interesting fact concerning the first singing of this song is not generally known, however, viz: that Mrs. Florence Maybrick was the one who first sang the words which have aided so materially in making the name of "Stephen Adams" famous.

Comparatively few people are aware that "Stephen Adams" is, in fact, Michael Maybrick, the well-known English baritone, who was a brother to the Liverpool merchant, for whose alleged murder Florence, his American wife, was sentenced to death more than ten years ago, reprieved at the special request of Her Majesty Queen Victoria, and condemned to a life of prison labor.

Born in Liverpool between fifty and sixty years ago, the brothers Maybrick, while remaining the closest friends, chose entirely different walks in life. The eldest became a merchant, while Michael, the younger, who was a man of magnificent physique and strikingly handsome, studied music in Italy and became, next to Charley Santley, England's most popular baritone singer.

But it was as a composer that Michael Maybrick, under the nom de-plume of "Stephen Adams" made most of his princely income. With the earliest efforts he succeeded in hitting the popular taste, and although his productions could not be called scholarly or even placed in the second class of musical compositions, the royalties produced by them represented little fortunes. "A Warrior Bold" netted Maybrick something like $15,000, and it is said that he received altogether more than a tenth of a million as royalties for "Nancy Lee," which the writer has heard him say he composed while riding on the top of a "bus" between the Criterion and Oxford Circus, a distance of less than half a mile. Other songs, which proved veritable gold mines to "Stephen Adams" were "The Midshipmite" and "The Blue Alsatian Mountains."

A private income, in addition to the royalties from his songs and proceeds of his profitable concert engagements, made Michael Maybrick a very wealthy man and his tastes ran to the possession of a magnificently appointed yacht. For many weeks during the year his yacht used to be anchored in the Mersey, only a short distance from his native city of Liverpool and his elder brother's residence. It was aboard this yacht that Michael Maybrick composed "The Holy City," and it was there that Florence Maybrick first gave voice to its melodious strains. The popularity of the song was slow to strike this country, for it has been a favorite in England since the concert season of 1890, when it was first sung in public by Edward Lloyd, the English tenor, who stood in the same relation to Sims Reeves, recently dead, as did Maybrick to Charles Santley.

The specious panorama of a year
But multiplies the image of a day,—
A belt of mirrors round a taper's flame;
And universal Nature, through her vast
And crowded whole, an infinite paroquet,
Repeats one note.

—*Emerson.*

DETECTED THROUGH A BIRD'S NOTE.

Trifles are ever leading to unexpected results, and an experience of a certain musician affords a further instance of the value of noticing little things.

The musician in question owned an ebony flute with silver keys. He valued it highly; but, as one of the upper notes was defective, he seldom used it. A young man lodged with the musician, and between the two a close friendship existed.

One night the ebony flute disappeared, having no doubt been stolen. Suspicion fell on several persons, but nothing could be proved against any of them. Not long afterward the lodger went to live in a town a few miles off, but as the friendship between the two men still existed they occasionally visited each other.

Nearly a year afterward the musician paid his friend a visit and was pleased to find him in possession of a beautiful bullfinch, which could distinctly whistle three tunes. The performance was perfect, with the exception that whenever he came to one high note he invariably skipped it and went on to the next.

A little reflection convinced the musician that the note in which the bullfinch was imperfect was the deficient note on his lost flute. So convinced was he that he questioned the ex-lodger on the subject. The latter at once tremblingly confessed his guilt and added that all the bird knew had been taught to him on the stolen instrument.—*Stray Stories.*

GOOD POPULAR SONGS SCARCE.

"It is singular, but true," said a music publisher, "that there are very few big hits in popular songs nowadays, that is, songs that have reached the million mark in sales such as 'After the Ball,' 'Annie Rooney,' 'Daisy Bell,' 'Down Went McGinty,' 'Two Little Girls in Blue' and 'Comrades.' Many songs published since then have been very popular, to be sure, but they cannot be compared with the old-timers.

"Many dealers have asked me the cause of this, but thus far I have been unable to explain it satisfactorily. It is all the stranger when you take into consideration the fact that there are more singers and better facilities for pushing songs than in former years.

"Years ago a good song would force itself upon the public. At present a publisher has to humor the singers and do a lot of hustling. Some of the top liners require pay to sing songs. In the old days they were only too glad to get a good ballad. To cater to the whims of the singers a publisher must have at least three pianos in his establishment, employ expert players and vocalists to teach the songs, print professional cards and do a thousand other things. You see the competition is keen, and if you should hurt the feelings of any singer, especially a man or woman of reputation, you will have considerable trouble in making your songs popular.

"Publishers have to take a lot of chances too. For instance, to popularize a song you must have slides made for stereopticon views. This costs quite a sum. One publisher spent $400 to take pictures for a set of slides for the song 'Sing Again That Sweet Refrain.' He had to employ a troupe of colored minstrels, a band and a hall. Fortunately the song made money and he did not lose anything. There are other things to contend with, too, such as lawsuits, etc. There was a dispute over the ownership of one song for instance. After fighting in the courts for some time one of the firms concerned compromised by paying the other $2,000 in cash and the costs of the suit."

THE MOST MUSICAL LINES IN ENGLISH POETRY.

For "the love of lovely words" we turn naturally to Coleridge, Keats, and Tennyson, perhaps our greatest masters of poetic music. Coleridge gives us such lines as:

By lonely Otter's sleep-persuading stream;
or: Singeth a quiet tune.

Tennyson, who knew whereof he spoke, gave the palm to a part of Keats' "Ode to a Nightingale," in which occurs the line:

Of perilous seas, in finery lands forlorn,

and to this, from Gray's "Elegy":

And drowsy tinklings lull the distant folds.

Swinburne, who has every claim to be heard, says that the following lines, from Tennyson's "Lotus Eaters," are the most musical in any language:

Music that gentler on the spirit lies,
Than tir'd eyelids upon tir'd eyes.

According to Canon Pownsley, Tennyson said he was most glad to have written:

The mellow ouzel fluted in the elm.

But others would prefer from the same poem, "The Gardener's Daughter":

The line a summer home of murmurous wings.

It would hardly be possible, however, to find greater perfection of human utterance than the following lines from Shakespeare, Milton, Shelley, Keats, and Tennyson:

Gilding pale streams with heavenly alchemy.
Now to the moon in wavering morrice move.
Likes a glow-worm golden in a dell of dew.
And hides the green hill in an April shroud.
The moan of doves in immemorial elms,
And murmuring of innumerable bees.

—*The Unique Monthly.*

THE ORGAN.

ORGAN AND CHOIR.

WM. HORATIO CLARKE.

The Organ and Violin.

M. P.—"What organ stops are suitable to use in accompanying a violin solo? If an organ is tuned in equal temperament, with the fifths flat and the fourths sharp, so that all keys are alike, will a violin which is tuned in perfect fifths blend with the organ?"

Answer.—All the soft 8 ft. stops alone or in combination with the 4 ft. Flutes may be used with good effect in accompanying the violin or violoncello. The Gt. Open Diapason would be too loud, but the Sw. Open Diapason may be used. The violin tones blend well with the different qualities of organ timbre. With the violin, only the open strings G, D, A and E are tuned in perfect fifths, and as the intervening tones are made by the fingers, the pitch is involuntarily adjusted by a sensitive player. If any dissonance is perceived in the use of the open strings (which do not remain long in tune), it can be avoided by not playing the open tones, as is customary in the most delicate and expressive rendition. The variation caused by the equal temperament is so slight that the waves are not perceived by the ordinary ear, any more than when two or more violins are played together on one part in unison. So that practically, when a violin solo is accompanied by an organ, no dissonance is perceived if the violinist plays in tune, even when the open strings are perfectly in tune. Few players on the violin can give the scale in the various keys as accurately in relative tune as is produced in the equalized temperament of an organ or pianoforte.

●

An Amateur's Muddle.

R. M. T.—"The organ I play in church has two manuals. It has no Trumpet in the Great Chest, but a two rank Mixture. The Swell has both a Trumpet and an Hautboy. In order to give the Gt. more power (and being a mechanical amateur), I have taken out the Mixture and fitted a thin top board over the other, and boring new holes into the old ones, have removed the Trumpet from the Swell, and have fitted it to the new top board with a new rack. In doing this I have got into a hornet's nest of trouble. Many of the Trumpet pipes will not speak, and those which will sound, when I try to tune them will only sound flat of the pitch and entirely choke off. Others give forth an intolerable coarse rattling sound instead of a musical tone, and I am desperate and disgusted over the whole thing. Can you help me out of a dilemma?"

Answer.—Your trouble arises from two sources. First, in fitting the thin strip over the old top board which had two holes for the two ranks of Mixture pipes, you did not bore your holes so that the Trumpet pipes got wind enough to vibrate the reed tongues, and those which spoke could only give a flat pitch on account of lack of wind pressure. Other reeds would rattle somewhat from this same defect, and the second reason is probably because some of the fine dust from the boring worked under the tongues. The best thing for you to do would be to clean the Trumpet thoroughly as indicated in a late number of THE MUSICIAN, and replace it in the Swell, if you want to use it, and in the place of the Mixture have an organ builder put in a modern Gamba. If the reed tongues of the Trumpet are bent, the whole stop will have to be sent to an organ builder and be revoiced.

●

Grooved Top Boards.

J. C. M.—"Could not a small organ of two stops, an Open and Stopped Diapason, be so arranged by 'grooving' so as to give the effect of four stops, by having a slide for a stop under a top board next the St. Diapason, with grooves or conductors running diagonally to the pipes an octave lower, so that the effect of a 16 ft. Bourdon from Tenor C could be produced from the St. Diapason pipes? Also another top board with a slide next the Open Diapason with grooves running to the pipes an octave higher, so as to give the effect of a 4 ft. Octave, with twelve additional pipes at the treble end of the Open Diapason, and with a Dulciana treated in the same way, could not the effect of six stops be obtained from an organ of three sets of pipes?"

Answer.—Such an organ could be constructed, and has often been done by amateurs, but the expense of labor would be equivalent to having actual pipes, with poorer results. The balance of tone would not be good, because a 16 ft. Bourdon should not be so full as a St. Diapason, and a 4 ft. Octave should always be subservient to an Open Diapason. One set of pipes cannot be made to do the duty of two, and the effect would be as indistinct in the melody of the music as when an octave coupler is used. Every attempt to get something for nothing in building a pipe organ, is as unsatisfactory as in all departments of mechanics or philosophy. There is an intrinsic value in the cost of a pipe organ in labor and material, and every attempt to cheapen either is detrimental to the musical value.

●

Electric Action.

E. M. K.—"Is there any advantage gained over tubular pneumatic action in the application of electricity to the mechanism of the organ?"

Answer.—There is nothing gained by the introduction of electricity excepting when it is desirable to locate the key-desk at a distance from the instrument. The electric action needs much attention and should not be introduced unless there is an expert organ electrician always near at hand to adjust any portion which needs immediate attention.

●

The Art of Voicing Organ Pipes.

S. H.—"Will you kindly describe to an amateur how to voice different organ pipes so that I can voice a small organ into which I intend to put entirely new pipes? When does the mouth of a wood pipe need cutting higher?"

Answer.—It requires a long experience and patient application to learn how to voice, and no book or written article will give you the information, because it is impossible to describe qualities of tone without a practical illustration in hearing results. The secrets of the voicing-room are seldom imparted to an amateur, and outside of the musical department of an organ factory, one can only learn to voice who has the means to purchase many sets of pipes which he can afford to spoil by many failures. Before attempting to voice pipes one must know what qualities of tone he wants to produce, and what scale and method of construction will give the desired tone. Of course, much may be learned from studying the structure of pipes as they may be seen in an organ, but that does not teach the needed manipulation. An organ voicer will give you no information concerning this important feature, and you had better buy your pipes already voiced.

In regard to cutting up the mouths of wood pipes, it is done to a graduated scale, for if one or more pipes in a set should be cut up differently, the quality of tone would vary. The height of the mouth depends upon the wind pressure and scale of the pipe. A small scale wood stop is generally cut higher than a large scale. There are certain conditions which sometimes govern the cutting up of a stop, viz.: When shutting off the wind at the foot softens the pipes too much for the desired quality. When the flue in the cap is too wide. When the tone is thin and has a quint or fifth in it. When the upper lip is too thin. When the tone is overblown. When the upper edge of the block has not the correct bevel. When the nicking is not deep enough to spread the wind current. When the tone has not body enough. And so on, for different reasons which only experience can dictate. The higher a pipe is cut, the more wind pressure is needed to reach the upper lip, and there is a consequent increase of the power on account of the greater amount of vibrating surface exposed to the irritation of the wind current. Where all the details of structure are carefully observed, there is no variation from the scale in any point, nor is there any experimenting on the part of the voicer who has learned his art.

The Decadence of the Reed Organ.

S. D. S.—"Why has there been so little improvement in American reed organs of the exhaust bellows system during the past twenty-five years, and why are so few to be found in the music stores?"

Answer.—It is true that there has been no marked improvement in the tone or construction of American reed organs during the past twenty years or more, because their use and commercial value has rapidly been diminishing. The introduction of low-priced upright pianofortes has caused them to be superseded as an article of musical merchandise, and there has been no demand by the purchasing public for a higher grade. Thirty-five years ago the papers and magazines were flooded with high-sounding advertisements inserted by the competing manufacturers. At present nearly all of the reed organ concerns who did not go out of the business are engaged in the manufacture or sale of pianofortes. Good second-hand reed organs, which sold for $250.00 twenty-five years ago, can now frequently be purchased for $25.00, in good condition.

●

The Janko Keyboard.

M. R.—"Has the Janko Keyboard been applied to the pipe organ?"

Answer.—The Janko Keyboard consists of six small rows of keys, as applied to the pianoforte, but the application to the pipe organ, with more than one manual, would bring the more remote keyboards too far from the player. It has been applied to single manual reed organs in Germany, but there is nothing to be gained by its use in organ music. Whatever has been written for the organ may be performed upon the style of keys so long in use. Organ music does not call for the rapid playing, brilliant arpeggios and octave movements which are customary in piano music.

●

A Suggested Improvement.

H. H.—"I have read the topics considered in the organ department with much interest, and should be pleased to have your suggestions for improvements in the following specification if you think any change would be advisable before closing a contract with a builder.

I.	II.
16 ft. Bourdon.	8 ft. Violin Diapason.
8 ft. Open Diapason.	8 ft. Stopped Diapason.
8 ft. Viol di Gamba.	8 ft. Salicional.
8 ft. Dulciana.	4 ft. Flute Harmonique.
8 ft. Melodia.	4 ft. Fugara.
4 ft. Octave.	2 ft. Flautina.
4 ft. Flute d'Amour.	*8 ft. Oboe and Bassoon.
*2⅔ ft. Twelfth.	
*2 ft. Fifteenth.	
*3 ft. Mixture.	
PED.	
16 ft. Open Diapason.	8 ft. Violoncello.
16 ft. Bourdon.	

with the usual mechanical registers.

The organ is to be placed in a gallery so low that the 16 ft. Open Diapason pipes will have to be inclined on account of the lack of height. An answer in the columns of THE MUSICIAN will be greatly appreciated and your opinions may interest other organ committees."

Answer.—If anything were to be added to the Great Section, I would suggest a Second 8 ft. Open Diapason with a stopped wood bass below the lowest G. The Viol di Gamba should be made and voiced with the modern draught beard, which gives strength and blends better than a Trumpet. In place of the Twelfth a Quintadena would be greatly preferable. This should be of a strong tone, containing the fifth or twelfth harmonic of a flutey quality with a filling 8 ft. ground tone when properly voiced, and is a pleasing stop in many combinations. In place of the Fifteenth I would recommend a 4 ft. Gambette, which is an incisive Octave Gamba with a draught beard, and more effective in the full organ than the shrill Fifteenth. I would not have a Mixture under any consideration in this scheme. This stop in an organ of the capacity indicated is simply an unmusical nuisance, handed down from the dark ages of imperfect conceptions of acoustics and illusively sustained by illogical theorists which, with its inharmonious din, only adds noise and confusion, making the organ more like a box of shrieking whistles than the dignified instrument which it would otherwise be.

In the Swell Section I should put a modern Oboe Gamba in the place of the reed stop, which is seldom found in tune, and does not blend so well with the other stops as the Oboe Gamba. You should not have any stops which cannot be used at all times.

The longest 16 ft. Pedal Open Diapason pipes may be placed horizontally over one another at the rear if there is room to so locate them. This would be better than placing them on an incline or mitering them. In so low a gallery the effect of the tone is not pleasant to the organist, as the reflection is so immediate.

The changes recommended would bring the actual cost within the limits of the specification you have sent. The effectiveness of this organ would depend much upon whom you employ to build it, the scales of the pipes and the voicing talent. The advice given in THE MUSICIAN is independent of any builder, and is drawn from long experience and philosophical observation, free from prejudice and impractical theories.

●

A Screen Front.

J. M. W.—"At the end of my studio is a spare room, with folding doors, in which I should like to place a two manual pipe organ. This room is 15 ft. deep, 16 ft. wide and 11 ft. high. Could not a screen work be placed across this opening and a swell frame fitted behind it so as to swell the whole instrument?"

Answer.—A number of organ studios have been fitted in this way in England and the arrangement is excellent. You have room enough to place your largest bass pipes lengthwise, so that you could have even a 16 ft. Pedal Open Diapson piled up at the back of the room. The swell effect would be fine and you would save the expense of elaborate case-work, the only part appearing being the keydesk. The swell folds themselves could be decorated and form the screen. The manual bass pipes could be set off and down from the chests, so that you would have ample height.

●

For Home Organ Study.

O. H. R.—"What kind of a reed organ should I purchase for studying organ music at home?"

Answer.—A simple instrument with two complete sets of reeds throughout, of 8 and 4 ft. pitch, would answer your purpose. The multiplication of divided reed stops is a sham as far as organ study is concerned. By keeping a lookout at the music and auction stores you may be able to find just what you need in the way of a good, second-hand reed organ, as so many are being exchanged for pianofortes, and the dealers are selling them very low.

●

A Sunken Organ.

E. H. P.—"I have recently purchased a commodious city residence, in the upper story of which is a large hall, which was finished by the original owner for a private music-room. It has an unusual symmetry of design, which I do not wish to disturb, although I desire to have a three manual organ for my own use as an amateur organist. Underneath this hall, at one end, is a vacant room, 12 ft. high, 18 ft. deep and 17 ft. wide. Could a three manual organ be placed in this room, with the keyboard in the hall overhead, and the floor removed and covered with a fancy iron grating? What would be the musical effect in the hall?"

Answer.—The idea would be practical. The longer pipes could be placed horizontally instead of upright, so that you could have the proportionate basses. Under the grating the whole could be covered with swell folds in addition to the swell box opening at the top. Nothing should ever be placed over the organ in the hall so that the tone would be obscured, and when not in use the grating should be covered with canvas to prevent dirt falling down into the pipes. The keydesk could be at the end of the hall with the opening in front, the player facing his select audience. The tone would fill the room just the same as if the organ were placed in a recess, and better, because there would be no obstruction in the way of case-work or front display pipes. As your residence would be heated throughout there would be an even temperature.

●

An Organ in the Open Air.

J. W.—"If a large organ should be placed in the open air, without any surroundings, would not the sound be so dispersed that even the heavy pedal pipes would have no resonance?"

Answer.—An organ thus placed in the open air would not be effective. The sound of the flue pipes would be dispersed, but the reed pipes, if on a strong pressure, would be heard quite a distance. A wealthy summer resident of Newport once had a large organ built in his garden, and closed in by movable shutters, for the entertainment of his friends, but it had no musical value apart from the novel idea which the owner had the means of gratifying. The sound of the pedal pipes would be dispersed and not carry. An organ depends much upon the reflecting surroundings for communicating the vibrations with concentration. An organ in a pavilion with open sides, such as may be found at summer religious and educational resorts, has not the grandeur and effect as one in a large enclosed hall with solid walls. An organ in a large tent would also have a weak effect, as the resonance of musical vibrations depends much upon the solidity and sonority of the reflecting surface.

●

Applying an Electric Motor to a Reed Organ.

J. W. M.—"I have a large two manual reed organ with three complete sets of reeds in each manual, with a full set of pedals having two stops, with the usual couplers. I once had a small water motor to work it, but it made such a thumping that it was discarded. It is now pumped by hand. It takes forty up and down strokes a minute when the full power is played, and it takes about twenty pounds in weight to lift and depress the handle. Could I have an electric motor so attached so as to be independent of a blower? Would I be obliged to have a system of gearing to reduce the speed? There is a basement cellar under the room."

Answer.—You could have an electric motor attached, but the expense of reducing the speed so as to pump a reed organ with exhaust bellows would in the end cost ten times as much per hour as the present cost of blowing by hand. Were it a pipe organ with pressure bellows, an electric motor driving a rotary fan blower could easily be applied, because the regulation of the wind supply would then be operated by a simple gate or valve, closing automatically while the motor keeps up a continuous speed. With a reed organ the principle is entirely different, the air being exhausted from the bellows. This would require an automatic reduction of the speed by means of a rheostat, otherwise the constant working of the handle and exhausters would cause a puffing at the safety valve and the tone would be forced.

●

Wire Used in Electric Organs.

W. M. D.—"In electric organs, what size of copper wire is used, and is it insulated with silk or cotton? How much wire is used per magnet? How many batteries, and what kind should be used?"

Answer.—No. 26 copper wire is used, wound with silk. The core of the magnet is of soft iron, ¼ inch in diameter and 1¼ inches long, sufficient insulated wire being coiled to bring the diameter up to ¾ of an inch. Three series of Leclanché batteries, with a No. 18 insulated wire will be sufficient to carry the current from the keys to the magnets.

●

Feeders for Hydraulic Motor.

J. H. W.—"The organ I play on Sunday has two manuals of 8 stops each, with a pedal of 2 stops. I am expecting to have it blown by a hydraulic motor. If I should have independent feeders, of what size should they be made, the present bellows measuring 5 x 8 ft.?"

Answer.—On the supposition that the water pressure is sufficient and the motor large enough, two double feeders, each being four feet square, with a 10-inch stroke would give ample wind supply. By a double feeder is meant one where the power is applied to the center so that the four sides have an equal movement, instead of the hinged feeder already attached to the bellows blown by hand.

●

Playing from Memory.

H. W. E.—"Is it an essential part of an organist's education that he should commit to memory his fugues, concert pieces, etc., so as to be able to play them in public without the music before him?"

Answer.—No, it is not essential, although by the time he has mastered a difficult piece, he has it well committed to memory. It is a good plan to memorize every fine passage one meets with in organ music, because it sinks into the mind and is absorbed by the mental faculties as food for future composition and improvisation. In this way every good model becomes seed from which fruit will be developed in due time. Storing the mind with good music is the best antidote for a tendency to egotism. It is no evidence of a lack of culture to play with the score before one as a reference. It prevents much exhaustion of the nervous force, and makes not the least difference to those who are listening to the composition. If an eloquent public speaker is uttering the words of another, it has fully as much force with the minds of the hearers if he reads them with expression, than as though he should first commit them to memory and then deliver them. In fact, the supposition is that they are the actual words gives them more force. Some of the finest players do not commit their music to memory, but have greater freedom of expression and rendition from the fact that the music is before them.

●

Draughts of Air Near an Organ.

J. S. H.—"The members of my choir who sit nearest the organ always complain of a cold draught of air coming from above during the morning service in the winter time, even when the organ is not being played, and have requested that some special heating arrangement shall be put in before cold weather to obviate this. Will you please give some advice in relation to this. Would it injure the organ to have hot air pipes enter inside the case?"

Answer.—This cold effect is always noticed near large organs in the winter unless the temperature of the room is maintained all the time. When an auditorium is only heated during Saturday night and Sunday morning, it takes a long time for the metal pipes to become as warm as the temperature of the room. As the warmed air outside of the instrument comes in contact with the masses of metal pipes, it becomes chilled and sinks downward to a lower strata. This causes the cold draught to which you refer, during the morning exercises. You probably hear no complaint concerning this draught at the evening service, because then the pipes have become thoroughly warmed. The coldest place in a church in winter is at the keyboard of the organ, and the organist often plays the opening prelude with stiffened hands and benumbed fingers. It would be injurious to the organ to have any heating arrangement placed within the case. The room should be heated a few hours earlier than has been customary, which will somewhat obviate the cold draughts.

●

Amateur Voicing.

S. H. S.—"Can you give any directions in regard to voicing wood pipes? I have made a full set of stopped Diapason pipes, but find it impossible to make them produce an even quality of tone. Some of them speak the fifth and some the octave above, and the entire upper octave will give no sound that may be called an organ pipe tone, and the smallest will not speak at all. I have cut the mouths full high according to a regular scale, and have regulated the quantity of air by plugging the feet, but all to no purpose. Can I find any book of instruction in this art? Must I give diagonal or straight nicks?"

Answer.—It is impossible to tell what the trouble is without seeing and hearing your pipes. The mouths of wood pipes are not cut exactly to the same scale throughout, but the height of the mouth is gradually diminished toward the top. Your upper octave will not speak with the common wind pressure if the mouths are too high, and that is probably one fault with your pipes. Another point to be noticed is, if the end of the tuning tampion which is in the pipe is perfectly square and true. If it is pointed, the upper pipes will not sound, and none of the pipes will give a true sound because there is no symmetrical reflection of the vibration. Sometimes the tampion of a bass pipe becomes canted, in which case the pipe will not give a true tone. There are no books from which voicing is taught. Straight nicks are generally made with open wood pipes. Diagonal nicks cause more disturbance of the current of air as it passes across the mouth, but do not influence the quality of the tone. After you have looked over the points referred to, attention will be given to your report.

●

American Reed Organs and Harmoniums.

A. G.—"What is the difference between an American Reed Organ and a Harmonium? I have several collections of music for the Harmonium, and some pieces for the Physharmonica published in France. Are the instruments the same in structure and tone?"

Answer.—There is an essential difference both in structure and tone. The reeds of an American reed organ are detached tongues and blocks fitted in sepa-

rate reed cells, and the air is drawn through them from the outside into a vacuum bellows by means of exhausters worked by the blow pedals, the air being sucked through the reed when the desired valve is opened. The reeds are somewhat narrower and thinner than in a harmonium, and the tone is more subdued, and somewhat modified by the surroundings.

In the harmonium the tongues are riveted to solid brass block plates in sections of an octave each. They are inverted in their position in the instrument and the air is forced outward from a bellows filled with compressed air supplied with feeders worked by the blow pedals. The tone is stronger, and when properly voiced and surrounded with environments which vary the quality, much variety is obtained. The Alexandre et Fils, Debain, and Mustel organ are the highest types of this class. Being high priced, and with the heavy tariff, they are not to be found in the American market, where at present the instruments made in the United States are sold at very low prices. The Physharmonica is another name for the foreign harmonium. Music for these instruments has been arranged and composed by some of the leading French organists and carefully registrated.

●

Service Prelude No. 5.

The Service Prelude in this number is in the form of a meditation. On account of the connected phrases and sections there is not much opportunity for removing the hands from the keys to change the registration, and the contrasts are made by changing the hands on the manuals. With an organ containing composition pedals much variety may be obtained. Although the subject is simple, there are many modulations to be studied. The harmony is complete without the use of the pedals. The inventive talent of the organist will be exercised to discover different methods of registration effects.

●

Dimensions of the Choral Organ.

A. D. M.—"I was much interested in your description of the Choral Organ in the April number, because it seems to be just what is needed in our small Church to take the place of the Cabinet Organ which has been used many years to accompany our choir. Will you please state the space the small instrument will occupy? Would such an instrument have to be made to order, or are they supplied by dealers in musical instruments?"

Answer.—The smaller Choral Organ will require a space of 4 ft. in depth, 8 to 9 ft. in width, and a height of 9 ft. It would have to be made to order, which would require three or four months. Dealers do not keep instruments of this kind in stock, because the price does not admit of a trade discount, and it would not be a profitable investment, as the sales would be limited. The next two sizes described in Article XI, should have a heighth of 12 ft. and a depth of 5 ft.

●

Singing Softly at Choir Rehearsals.

C. E. H.—"Do you consider it a wise plan for a choir to sing at the top of their voices all through a rehearsal? Our leader seems to think that he cannot fire his singers with enthusiasm unless we shout with all our force during nearly all of our pieces at the rehearsals. The result is that we are all tired out and come with hoarse voices to sing in the service the next day, and do neither the music nor ourselves justice. I wish you would write a few words on this subject to be shown to our leader, for the benefit of our choir."

Answer.—The way to make the best of a rehearsal is to drill the choir with mezzo power, or even piano, or even humming, until all the notes of each part are put together and the difficulties overcome. In this way each part will hear the other, the intonation will be more perfect, and there will be no fatigue of the vocal organs. As soon as the music is learned and the voices blend in quality and in tune, then the piece being learned may be given with its proper force and more progress made. In the finishing work the parts may be properly balanced by careful judgment. Thus, if the alto is too loud for the soprano, the alto voices must be modified in power, or if the soprano should be louder, that will be consequently governed. This would avoid what occurred at a concert recently given by a chorus choir in a Western town, who had gone from another town to show their attainments and encourage the art of church music. The ladies had carried with them their white dresses in which to appear. On taking their position on the platform, it was found that the sopranos were more than double the number of the altos. As soon as the leader perceived this, instead of asking the sopranos to modify their voices so as not to overpower the lesser number of altos, he coolly requested one-half of the sopranos to step down and take their places among the audience, to their great discomfiture as they sat there with their white dresses, after all their musical preparation and efforts to be present. The result culminated in the breaking up of the choir, and all this trouble arose from lack of judgment on the part of the leader in not knowing how to balance the voices as they were in number. Had he been in the habit of drilling softly, he could easily have brought the voices into good musical balancing, for numbers on a part do not always count in dynamic force, especially where some of the voices are not strong. The question asked is worthy of consideration by all chorus choir leaders, and will be of interest to singers who voluntarily devote one evening a week of their valuable time for the sake of rendering good music in the Sunday services. It is never injurious to the voice to sing softly.

●

Choir Breathing.

E. F.—"Can a choir be so drilled that all the singers will take breath at the same time, or rather, all the singers of one part, so that the breathing will not interfere with the proper accent of the words?"

Answer.—Yes, by having breathing marks pencilled in the score. Some choir music is published with the breathing commas so that the inhalations will be uniform. The breathing should be from the muscles of the diaphragm, and the tone never forced by using too much breath in vibrating the vocal chords. If a choir is taught to cultivate the plan of full and deep breathing without effort, there will always be a reserve force, and the tone will be full and resonant when power is required.

●

Choir Accentuation.

J. C. J.—"Should a choir be trained to observe the regular accents of a measure according to the kind of rhythm?"

Answer.—Yes, with a natural accent which should not be mechanical. Without this accent the music will be tamely rendered. There should be no outward signs of the accent in motions of the head or time beating, or swinging of the books or music sheets. The cultivation of the accent will put more animation into the execution. It was somewhat overdone in the "old folks" music of former days, and has been quite neglected in modern times. Your own musical judgment will teach you not to carry it to excess.

●

The Tonic Sol-Fa Method.

J. C. B.—"Is the Tonic Sol-fa method of reading music making any progress in this country? Would it be advisable to train a choir to read music after this system?"

Answer.—Attempts have been made to introduce the Tonic Sol-fa system of vocal music in this country, but it has not been adopted. At the time of its introduction in England the system of reading music was tied to the fixed Do always in C. Re was always in D, and so with all the other letters. When the major scale of A was sung the syllables la, si, do, re, mi, fa, sol, la were used. If the major scale of E was sung the syllables were always mi, fa, sol, la, si, do, re, mi. This led to much confusion in singing the whole and half steps in their proper relation, and was a great stumbling-block in the art of reading music, and the Tonic Sol-fa system was devised, using the initial letters and pointings derived therefrom of the common Do, re, mi scale, which always brings the half steps or minor seconds between mi and fa and si and do in ascending and descending the scale as well as in all other relationships. The movable Do was thus made to fit every key. The use of the staff was abolished and modulating tables were in vogue to indicate changes of key in passages which modulated into other keys. One great disadvantage in this system is the lack of seeing the music of the various parts and seeing it pictured before the mind as indicated in the prevailing staff notation.

The movable Do system has been in use in this country for the greater part of the past century, using the staff notation of past centuries. The old singing school teaching was always based upon this system, and the obstacles current in England did not have to be contended with. The earliest musical instruction in public schools was also established upon this system, so that there has been no necessity for adopting the Tonic Sol-fa method, which is far behind the American system of the movable Do. The pedants who hold to the Fixed Do system are few in number. Once in a while a foreign teacher will insist upon a pupil using it exclusively, but he finds it up-hill work to extend what is almost an obsolete method. For these reasons it would not be desirable to introduce the Tonic Sol fa system of notation in choir work, as it is easier to apply the movable Do method to the time-honored staff notation in which there is more musical progress and enjoyment in seeing the relative height and depth of tones as represented on the lines and spaces in which the eye can be directed ahead and the mind better prepared for reading at sight. It is hard to sing difficult music at sight with the Tonic Sol fa system, and where there are remote modulations it amounts to committing the sounds to memory, the signs answering the purpose of refreshing the remembrance and thus acting as cues.

●

Facial Expression in Choir Singing.

B. W. W.—"I wish you would append a few remarks on the cultivation of a good expression of the features in singing. I am led to allude to this by an experience of our own large choir. We have been earnestly practicing for an oratorio concert, before giving which, we decided to have our pictures taken together as a choir, dressed for the concert. So at one of our last rehearsals the photographer came with his largest sized camera and placed everything in readiness for a flash-light picture, but before posing our leader desired to rehearse several choruses. In the midst of one of the most spirited choruses when all the voices were at the highest notes, outvying each other with ambitious enthusiasm, we were suddenly blinded by what we supposed was a premature explosion of the flash-light, as the artist said that he was getting things ready. And we went on with our work until we were all ready for the picture. But what was our surprise to find on exhibition in a prominent show window, a day or two later, of two pictures of the choir, one in labor and the other in repose! The unprepared picture was the most ludicrous exhibition one could conceive in the expression of each singer, caught at the climax. The effect was painfully funny. Yet no one could help laughing at the sight, but we poor singers deeply felt that if we really look so to others when we sing, we had better have a screen put up higher than our heads and not be seen, although it would be a fine advertisement for the concert. Some heads were leaning towards others. Some had frowns and the others smirks. The eyes of the tenors were rolled up and their brows looked as if they were in terror, while the mouths of the basses were drawn down and their foreheads wreathed in scowls.

The altos had a complacent staring smile with their mouths wide open on a sustained note, while the sopranos looked as if they had all been frightened together and had been brought to bay hopelessly, all excepting the end soprano, who was rapturously looking up into the reciprocating gaze of the end tenor as their voices harmoniously blended. The leader was also bending down as if in the act of beating a carpet and shaking the dust off of his feet at the same time. The public exhibition of the picture was quickly suppressed, but it was too amusing to be lost, and each member of the choir will have one for a souvenir. It is a forcible lesson of an art which needs cultivation on the part of singer—the art of facial expression in vocal music."

Answer.—You have been so explicit that comment is hardly necessary concerning an attainment which needs more cultivation, especially on the part of amateur singers. Concert soloists give much attention to this development which often deteriorates into an artificial stage smile. All singers should cultivate a repose of the features in singing and all unnecessary motions of the head or body should be avoided. It is not a good habit to rise up on tip-toe in order to reach the higher notes, nor to sink the head down into the shoulders in order to vibrate the deeper tones. There should be a natural and pleasant expression on the countenance in singing with no signs of effort to mar the musical utterance. Farther than this, there can be no formal rule for a choir. The readers of THE MUSICIAN would doubtless like to see a reproduction of the active choir picture if the members would consent to its duplication.

IN THE MUSICAL WORLD

AT HOME.

Mme. Adele Lewing is spending her vacation in Block Island and the Adirondacks. She will resume her teaching on Sep. 20.

Herve D. Wilkins gave an organ recital in St. Mary's Church, Waterloo, N. Y., August 15. The program was of the high order usual to Mr. Wilkiu's recitals.

Charles Gregorowitsch, the Russian violinist who made such a favorable impression upon his first tour of this country a few years ago, returns for a tour of this country commencing in November.

Dr. George F. Brooks, the Boston Concert Organist, has been appointed musical director and professor of the church organ at the Boston Conservatory of Music, by the president, Roscoe Marriner Floyd.

Mr. J. M. Dungan has inaugurated a series of historical piano recitals in connection with his piano school at Indianapolis, which promises to be very successful. The plan, as at present outlined, will continue four years.

Yale University at New Haven is to have a new music hall. The building is to be of marble and the preliminary plans fix the dimensions as 80 x 140 feet. The structure is to be four stories high, and the architects promise a handsome design.

John Philip Sousa will take his band on another concert tour this fall. Last year the American musician completed a five months' tour of the principal continental cities, and now Sousa will introduce his band in Great Britain, where he has never appeared.

Mary M. Shedd has been giving a series of successful lectures on the American Method of Singing before a number of the prominent colleges and womens clubs in the West, and is arranging for a similar series to be given during the coming season in New York City.

William H. Sherwood will visit nearly every section of the country. Later engagements for him are Wellesley College, Wellesley Hills, Mass., and Muncie, Ind. Mr. Sherwood, who gave several recitals in North Carolina and Virginia last season, goes again this fall.

Mr. E. G. Hood, director of music in the public schools of Nashua, N. H., was elected president of the New Hamps' ire State Music Teachers' Association at its meeting in July. Mr Hood's fine work in his profession insures good results from his incumbency of this office.

A grand singing festival was held at Jamestown, N. Y., on July 22, 23 and 24, by the American Union of Swedish Singers. Delegate meetings of the various divisions were held each day and a concert was given each evening. Arvid Akerlind, of Brooklyn, was musical director. The program presented some interesting Scandinavian numbers.

Fritz Kreisler, the Austrian violinist, who won fame for himself in this country last winter by his brilliant playing, is to return again in January. He will open his tour in Chicago on January 10, when he will play with the Thomas Orchestra. Kreisler is now in Paris, where he is giving much of his time to the working up of a new reportory for his coming tour.

The Minnesota State Music Teachers' Association, organized last June, elected the following officers: President, Clarence A. Marshall, Minneapolis; first vice-president, Charles A. Fisher, St. Paul; secretary-treasurer, Miss Jennie Pinch, St. Paul; auditor, W. A. Wheaton, St. Paul; program committee, Gerard Tonning, Duluth; Emil Ober-Hoffer, Minneapolis; Carl Heilmaier, St. Paul.

The Sherwood Piano School, which was organized in 1897, has taken space in the Fine Arts building in Chicago. The school includes a department for children, a violin department, organ and harp departments, a vocal department, and gives instruction in the art of expression, in foreign languages. Mr. Sherwood has devoted especial care to the building up of his school, with particularly happy results.

Henry W. Savage, president of the Castle Square Opera Company, recently concluded arrangements to open a season of grand opera in English at the Century Theatre, St. Louis, Mo., beginning about January 1. Joseph F. Sheehan, Miss Adelaide Norwood, Miss Gertrude Rennyson, Miss Josephine Ludwig, Winfred Goff, F. J. Boyle, William Pruette, Reginald Roberts and other favorites will be heard in their strongest parts. Edward Temple will be stage director, and Emerico Morreale will direct the orchestra.

Francis Rae McMillen, an American boy of fifteen, son of a formerly well-known Ohio editor, has been the recipient of unusual honors in the Conservatory at Brussels. He has been granted the second prize of distinction after only one year of study under Cesar Thomson, the head of the Conservatory. It is said that he would have received first prize, but for the rule that its winner must have been in the Conservatory more than a year. Aside from the honor, the prize carries with it a year's tuition, exemption from examinations and a position among the first violinists of the Conservatory orchestra. Young McMillen studied formerly in Chicago and Berlin.

Recently the Boston *Daily Advertiser* said editorially:—One of the civic fathers of Marlboro is trying to secure the adoption of a new plan of popular summer concerts. This alderman thinks that there is a danger that people will grow tired of municipal band concerts. Consequently he proposes that in addition to the music of the band, a chorus of from 500 to 1,000 voices be organized to sing familiar patriotic airs and other music likely to appeal to the popular taste. He would not object to the introduction of a cannon and fireworks to give a spectacular effect to the novel concerts. Any visitor to a municipal band concert in Boston must have noticed that when the band plays familiar music the auditors often seem tempted to assist the instruments either by whistling or by humming the air. The chances are that if the Marlboro experiment is fairly carried out, the idea will spread.

ABROAD.

Meyerbeer is still popular in France. The opera that brought into the box office the largest receipts was "The Huguenots," with 23,000 francs to its credit.

The 17th of July thirty years ago was the death-day of Karl Tausig, an artist who seemed to be destined to be the successor of Liszt. It was after a visit to him at Weimar that Tausig was attacked by a serious fever, and died before he had reached his thirtieth year. From his school for higher piano playing, founded in 1866, at Berlin, issued such pupils as Rafael Joseffy, Oskar Reif, Max Pinner, Vera Timanoff and other celebrated performers. Tausig was one of the early champions of Wagner's ideas. Wagner spoke of him first and foremost in his address on the laying of the foundation stone of the theatre at Bayreuth as one of the most able supporters of his plan. Wagner wrote for his tomb.

Mrs. Stella Prince Stocker delivered her final lecture in Germany at Berringer's Music Hall, at Warnemünde, on July 20. Her topic, "Indian Myths and Melodies," is naturally one to arouse the interest of intellectual and musical Germans, and her audience proved to be one of the largest ever assembled at the hall. Many persons of distinction heard the lecture, which was accompanied with musical illustrations. Mrs. Stocker returns to New York with her young son, Master Arthur Stocker, the boy soprano.

A society has been formed for giving model performances of classical operas in Paris. The necessary funds have been raised, and the first performance, the "Götterdämmerung," will take place April 15, 1902. Madames Litviune and Brema, and Ernst Van Dyck and Edouard de Reské are engaged, as well as two celebrated French vocalists. The orchestra will consist of 100 pieces chosen from the Lamoreux Orchestra, and will be invisible, as at Bayreuth. It is supposed that Cortot, a young genius of twenty-three, will conduct in chief and superintend the staging and rehearsals. With him will be Chevillard, Mottl and Siegfried Wagner. One of the most interesting revivals will be Berlioz's "Damnation de Faust," with the costumes and decorations desired by the composer.

How artists used to be rewarded in London may be inferred from a curious announcement that has been unearthed by Mr. Edwards from a daily paper of 1833, to the effect that "elegant pieces of plate" had been prepared by the Philharmonic Society for presentation to Pasta, Malibran and Herz, "for singing and performing without any charge." Down, however, to a much later date the custom was continued by the Sacred Harmonic Society, who offered such low fees that several of the singers preferred that the total amount due to them for the season should be devoted to the purchase of plate, which was inscribed as "presented by the directors" to the singers in question. The vocalists seemed to imagine that small as the fees were, the affair was of value as an advertisement.

Louis C. Elson, who is spending the summer in Europe, is sending letters to the *Evening Post* of New York, as special correspondent. A recent letter from Monte Cassino, Italy, was dated July 8, and is devoted principally to a description of his visit to the monastery at the above-mentioned place, the first monastery that the world possessed, founded in the early part of the sixth century. Among the treasures in the library Mr. Elson found "a most important musical manuscript of the eleventh century, the earliest example of the 'Ut, re, mi, fa, sol, la' system." At high mass "the organ played by one of the brothers was a noble instrument, very sweet toned, yet sufficiently powerful." From private letters received from Mr. Elson, it is learned that his intention is to visit Russia before returning home.

The musical festival, under the auspices of the Mozarteum, at Salzberg, was opened August 6 with a festival concert directed by Josef Hellmesberger, with the Vienna Philharmonic. In the audience of over 1,000 occupying the Aula Academia there were many English and American enthusiasts, and the "protector" of the festival, Archduke Eugen, who resides at Innsbruck. Works of Mozart only were performed; the soloists were Petschnikoff, violinist, and Fra Wedekind, of Dresden. In the evening, "Don Juan" was produced at the theatre, Ritter singing the title role, Heschz being cast for Leporello. Lilli Lehmann was the Donna Anna; Edith Walker the Elvira; Wedekind the Zerlina; Schaezle, of Stuttgart, the Mazetto; Arauyi, of Budapest, the Ottavio, and Klöpfer, of Munich, the Commandant. Director Hummel, of the Mozarteum, was conductor. The festival continued for three days, "Don Juan" being repeated on the last night.

Edmond Audran, the French composer, died in Paris, August 19. He was born at Lyons, April 11, 1842, and was the son of Morius Audran, the singer, who died in 1877. He entered the Niedermeyer School in 1856, where he obtained several prizes. In 1861, he followed his father to Marseilles, where he became choirmaster at the Church of St. Joseph. About that time he composed several comic operas, among them "The Bear and the Paseha," adapted from a vaudeville by Scribe, 1862; "La Chercuse d'Esprit," 1864; "Nivernaise," 1866, and "The Little Poucet," 1868. In 1881, he went to Paris and wrote the music for several comic operas. Chival and Duru became collaborators with him about that time, and together they produced "La Mascotte" and "Olivette," which became so popular in this country. "The Great Mogul" was composed in 1883; "The Paradise of Mahomet," 1887, and several others were produced by the trio. Audran also composed the music for "Miss Helyett," an opera in three acts. In 1893, he composed an elaborate mass, which was sung at Marseilles and at Paris.

BAYREUTH, August 13, 1901.

Editor of THE MUSICIAN:
